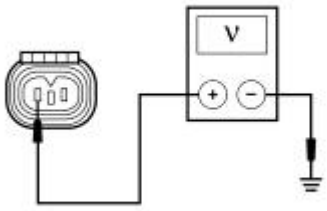
While pressing the door lock control switch in the UNLOCK position, measure the voltage between the inoperative door

</td></tr>
</table>

lock actuator, harness side and ground as follows:

Inoperative Door Lock Actuator	Connector-Pin	Circuit
LH front	C525-2	CPL51 (BU/GN)
RH front	C603-2	CPL52 (VT/GY)
LH rear	C704-2	CPL52 (VT/GY)
RH rear	C804-2	CPL52 (VT/GY)



N0058777

- **Is the voltage greater than 10 volts when the unlock switch is pressed?**

for normal operation.

No
GO to B3 .

B3 CHECK CIRCUIT CPL51 (BU/GN) OR CIRCUIT CPL52 (VT/GY) FOR AN OPEN

- Disconnect: SJB C2280e.
- Measure the resistance between the inoperative door lock actuator, harness side and the SJB, harness side as follows:

Inoperative Door Lock Actuator Connector-Pin	SJB Connector-Pin	Circuit
LH front C525-2	C2280e-28	CPL51 (BU/GN)
RH front C603-2	C2280e-27	CPL52 (VT/GY)
LH rear C704-2	C2280e-27	CPL52 (VT/GY)
RH rear C804-2	C2280e-27	CPL52 (VT/GY)

Yes
GO to B4 .

No
REPAIR the circuit. TEST the system for normal operation.

 N0060160 • **Is the resistance less than 5 ohms?**	

B4 CHECK FOR CORRECT SJB OPERATION
• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test C: The Door Locks Operate Only One Way

Refer to Wiring Diagrams Cell 110 , Power Door Locks for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends voltage signals to the door lock control switches through circuits CPL27 (WH/BN) and CPL30 (BU/BN) for the lock and unlock requests, respectively. When the lock or unlock switch is pressed, the voltage signal is routed to ground.

The SJB contains internal relays that are energized depending on input received. When the SJB receives a lock or unlock request from the door lock control switch, the SJB energizes the appropriate relay(s) to lock or unlock the doors.

DTC B2A25 — is an on-demand DTC that sets when the SJB detects a short to ground from the lock or unlock request input circuits.

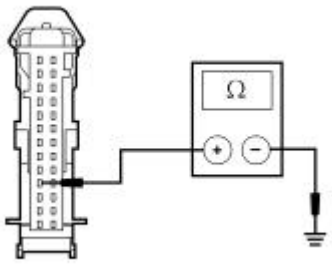
Possible Causes

- Circuit CPL27 (WH/BN) open or short to ground
- Circuit CPL30 (BU/BN) open or short to ground
- SJB

PINPOINT TEST C: THE DOOR LOCKS OPERATE ONLY ONE WAY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use correct probe adapter(s) may damage the connector.

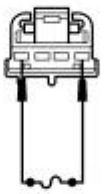
Test Step	Result / Action to Take
C1 CHECK THE RECORDED SJB DTCs FROM ON-DEMAND SELF-TEST • Check the recorded results from the SJB and power liftgate module self-test. • **Is DTC B2A25 present?**	**Yes** GO to C2 . **No** GO to C5 .
C2 CHECK THE LH DOOR LOCK CONTROL SWITCH • Disconnect: LH Door Lock Control Switch C505. • Repeat the SJB on-demand self-test. • **Is DTC B2A25 retrieved again?**	**Yes** GO to C3 . **No** INSTALL a new LH door lock control switch. REFER to Door Lock Control Switch in this section. TEST the system for normal operation.
C3 CHECK THE RH DOOR LOCK CONTROL SWITCH • Disconnect: RH Door Lock Control Switch C605. • Repeat the SJB on-demand self-test. • **Is DTC B2A25 retrieved again?**	**Yes** GO to C4 . **No** INSTALL a new RH door lock control switch. REFER to Door Lock Control Switch in this section. TEST the system for normal operation.
C4 CHECK THE LOCK INPUT CIRCUIT OR THE UNLOCK INPUT CIRCUIT FOR A SHORT TO GROUND • Key in OFF position. • Disconnect: SJB C2280d. • If the doors do not lock, measure the resistance between the SJB C2280d-17, circuit CPL27 (WH/BN), harness side and ground.  N0058779 • If the doors do not unlock, measure the resistance between the SJB C2280d-4, circuit CPL30 (BU/BN), harness side and ground.	**Yes** GO to C8 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.



N0058780

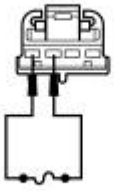
- **Is the resistance greater than 10,000 ohms?**

C5 VERIFY THE OPERATION OF BOTH DOOR LOCK CONTROL SWITCHES	
• Key in OFF position. • Press the lock and unlock button of both door lock control switches while observing the door lock operation. • **Do the door locks operate only one way from both switches?**	**Yes** GO to C7 . **No** GO to C6 .
C6 CHECK CIRCUIT CPL27 (WH/BN) (LOCK INPUT) OR CIRCUIT CPL30 (BU/BN) (UNLOCK INPUT) FOR AN OPEN (SINGLE SWITCH INOPERATIVE)	
• Disconnect: Suspect Door Lock Control Switch. • Unlock the doors from the working door lock control switch. • Connect a fused (5A) jumper wire between the LH door lock switch C505-1, circuit CPL27 (WH/BN), harness side and the LH door lock switch C505-4, circuit GD143 (BK/VT), harness side; or between the RH door lock switch C605-1, circuit CPL27 (WH/BN), harness side and the RH door lock switch C605-4, circuit GD138 (BK/WH), harness side.	**Yes** INSTALL a new door lock control switch. REFER to Door Lock Control Switch . TEST the system for normal operation. **No** REPAIR the input circuit in question. TEST the system for normal operation.



N0058784

- Remove the jumper wire.
- Connect a fused (5A) jumper wire between the LH door lock switch C505-3, circuit CPL30 (BU/BN), harness side and the LH door lock switch C505-4, circuit GD143 (BK/VT), harness side; or between the RH door lock switch C605-3, circuit CPL30 (BU/BN), harness side and the RH door lock switch C605-4, circuit GD138 (BK/WH), harness side.



N0058803

• **Do the doors lock and unlock with the jumper wire?**	
C7 CHECK CIRCUIT CPL27 (WH/BN) (LOCK INPUT) OR CIRCUIT CPL30 (BU/BN) (UNLOCK INPUT) FOR AN OPEN (BOTH SWITCHES INOPERATIVE)	
• Disconnect: LH Door Lock Control Switch C505. • Disconnect: SJB C2280d. • If the doors do not lock, measure the resistance between the SJB C2280d-17, circuit CPL27 (WH/BN), harness side and the LH door lock switch C505-1, circuit CPL27 (WH/BN), harness side.  N0058781 • If the doors do not unlock, measure the resistance between the SJB C2280d-4, circuit CPL30 (BU/BN), harness side and the LH door lock switch C505-3, circuit CPL30 (BU/BN), harness side.  N0058782 • **Is the resistance less than 5 ohms?**	**Yes** GO to C8 . **No** REPAIR the circuit in question. TEST the system for normal operation.
C8 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test D: All Door Locks Are Inoperative From One Switch

Refer to Wiring Diagrams Cell 110 , Power Door Locks for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends voltage signals to the door lock control switches through circuits CPL27 (WH/BN) and CPL30 (BU/BN) for the lock and unlock requests, respectively. When the lock or unlock switch is pressed, the voltage signal is routed to ground. Ground for the LH door lock control switch is provided through circuit GD143 (BK/VT). Ground for the RH door lock control switch is provided through circuit GD138 (BK/WH).

Possible Causes

- Circuit GD138 (BK/WH) open
- Circuit GD143 (BK/VT) open
- Door lock control switch

PINPOINT TEST D: ALL DOOR LOCKS ARE INOPERATIVE FROM ONE SWITCH

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
D1 CHECK CIRCUIT GD143 (BK/VT) (LH DOOR LOCK SWITCH) OR GD138 (BK/WH) (RH DOOR LOCK SWITCH) FOR AN OPEN	
• Disconnect: Inoperative Door Lock Control Switch. • Measure the resistance between the LH door lock control switch C505-4, circuit GD143 (BK/VT), harness side and ground; or between the RH door lock control switch C605-4, circuit GD138 (BK/WH), harness side and ground.  N0058783 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new door lock control switch. REFER to Door Lock Control Switch . TEST the system for normal operation. **No** REPAIR the circuit in question. TEST the system for normal operation.

Pinpoint Test E: The Liftgate Glass Latch Release Is Inoperative/Does Not Operate Correctly

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

The smart junction box (SJB) does not release the liftgate glass unless the doors have been unlocked electronically or the request is initiated from a remote keyless entry (RKE) transmitter.

The SJB sends a voltage signal to the liftgate glass release switch through circuit CPL60 (BN/YE). When the switch is pressed, the signal is routed to ground through circuit GD150 (BK/WH). When the SJB detects a request from the liftgate glass release switch, the SJB provides voltage to the liftgate glass latch release motor (integral to the liftgate glass latch) through circuit CPL59 (BN/BU). Ground for the liftgate glass latch is provided through circuit GD150 (BK/WH).

DTC B2667 — is an on-demand DTC that sets when the SJB detects a short to ground from the liftgate glass release switch input circuit.

Possible Causes

- Circuit CPL60 (BN/YE) open or short to ground
- Circuit CPL59 (BN/BU) open or short to voltage
- Circuit GD150 (BK/WH) open
- Liftgate glass release switch
- Liftgate glass release motor (integral to the liftgate glass latch)
- SJB

PINPOINT TEST E: THE LIFTGATE GLASS LATCH RELEASE IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use correct probe adapter(s) may damage the connector.

E12 CHECK FOR VOLTAGE TO THE LIFTGATE GLASS LATCH	
• Key in OFF position. • Unlock the doors with the door lock control switch. • **NOTE:** The SJB only supplies voltage to the liftgate glass latch momentarily. It is important to monitor the meter while pressing the liftgate glass release switch. • While pressing the liftgate glass release switch, measure the voltage between the liftgate glass latch C4040-4, circuit CPL59 (BN/BU), harness side and ground.  N0058788 • **Is the voltage greater than 10 volts when the switch is pressed?**	**Yes** INSTALL a new liftgate window latch. REFER to Liftgate Latch — Window in this section. TEST the system for normal operation. **No** GO to E13 .
E13 CHECK CIRCUIT CPL59 (BN/BU) FOR AN OPEN	
• Disconnect: SJB C2280e. • Measure the resistance between the SJB C2280e-31, circuit CPL59 (BN/BU), harness side and the liftgate glass latch C4040-4, circuit CPL59 (BN/BU), harness side.	**Yes** GO to E14 . **No**

 • **Is the resistance less than 5 ohms?**	REPAIR the circuit. TEST the system for normal operation.

E14 CHECK FOR CORRECT SJB OPERATION
• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test F: The Liftgate Latch Release Is Inoperative/Does Not Operate Correctly

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

The smart junction box (SJB) does not release the liftgate unless the doors have been unlocked electronically or the request is initiated from a remote keyless entry (RKE) transmitter.

The SJB sends a voltage signal to the liftgate release switch (part of the liftgate release handle) through circuit CPL45 (BN). When the switch is activated (the handle is pulled), the signal is routed to ground through circuit GD150 (BK/WH). When the SJB detects a request from the liftgate release switch, the SJB provides voltage through circuit CPL10 (BN/BU) to the liftgate latch release motor (integral to the liftgate latch) (vehicles with a manual liftgate) or the power liftgate module (vehicles equipped with a power liftgate). For vehicles with a manual liftgate, ground for the liftgate latch is provided through circuit GD150 (BK/WH).

DTC B2666 — is an on-demand DTC that sets when the SJB detects a short to ground from the liftgate release switch input circuit.

DTC B273A — is an on-demand DTC that sets when the SJB detects a short to ground from the liftgate latch release output circuit.

DTC B273B — is an on-demand DTC that sets when the SJB detects an open or short to voltage from the liftgate latch release output circuit.

Possible Causes

- Circuit CPL45 (BN) open or short to ground
- Circuit CPL10 (GN/WH) open, short to ground or voltage
- Circuit GD150 (BK/WH) open

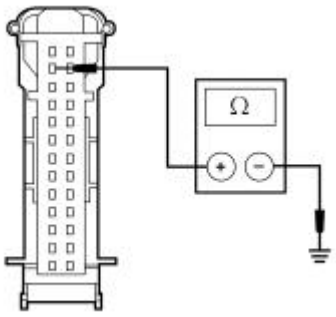
- Liftgate release switch (integral to the liftgate release handle)
- Liftgate release motor (integral to the liftgate latch)
- Power liftgate module
- SJB

PINPOINT TEST F: THE LIFTGATE LATCH RELEASE IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
F1 CHECK THE RECORDED SJB AND POWER LIFTGATE MODULE DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND SELF-TESTS	
• Check the recorded results from the SJB and power liftgate module self-test. • **Are any DTCs present?**	**Yes** For any power liftgate module DTC, REFER to Section 501-03 . For DTC B2666, GO to F2 . For DTC B273A, GO to F4 . For DTC B273B, GO to F6 (manual liftgate) or GO to F7 (power liftgate). For all other DTCs, REFER to the Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart in this section. **No** GO to F11 .
F2 CHECK THE LIFTGATE RELEASE SWITCH (SHORT TO GROUND)	
• Disconnect: Liftgate Release Switch C4340. • Clear the DTC and carry out the SJB on-demand self test. • **Is DTC B2666 still present?**	**Yes** GO to F3 . **No** INSTALL a new liftgate release switch. REFER to Liftgate Release Handle in this section. CLEAR the DTCs. REPEAT the self-test.
F3 CHECK CIRCUIT CPL45 (BN) FOR A SHORT TO GROUND	
• Key in OFF position.	**Yes**

• Disconnect: SJB C2280d. • Measure the resistance between the liftgate release switch C4340-2, circuit CPL45 (BN), harness side and ground.  N0058790 • **Is the resistance greater than 10,000 ohms?**	GO to F15 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
F4 CHECK THE LIFTGATE LATCH (MANUAL LIFTGATE) OR THE POWER LIFTGATE MODULE (SHORT TO GROUND)	
• Key in OFF position. • Disconnect: Liftgate Latch C457 or Power Liftgate Module C4174b. • Key in ON position. • **NOTE:** It may be normal for DTC B273A to be present when carrying out this step and should be ignored. • Clear the DTC and carry out the SJB on-demand self test. • **Is DTC B273B present?**	**Yes** For a manual liftgate, INSTALL a new liftgate latch. REFER to Liftgate Latch in this section. CLEAR the DTCs. REPEAT the self-test. For a power liftgate, GO to F14 . **No** GO to F5 .
F5 CHECK CIRCUIT CPL10 (GN/WH) FOR A SHORT TO GROUND	
• For vehicles with a manual liftgate, measure the resistance between the liftgate latch C457-1, circuit CPL10 (GN/WH), harness side and ground.  N0058791 • For vehicles with a power liftgate, measure the resistance between the power liftgate module C4174b-12, circuit CPL10 (GN/WH), harness side and ground.	**Yes** GO to F15 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

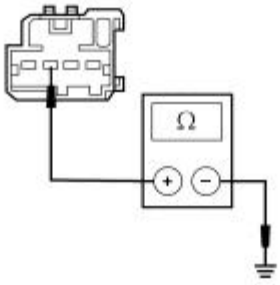


N0058792

- **Is the resistance greater than 10,000 ohms?**

F6 CHECK CIRCUIT GD150 (BK/WH) FOR AN OPEN (LATCH)

- Key in OFF position.
- Disconnect: Liftgate Latch C457.
- Measure the resistance between the liftgate latch C457-2, circuit GD150 (BK/WH), harness side and ground.



N0058793

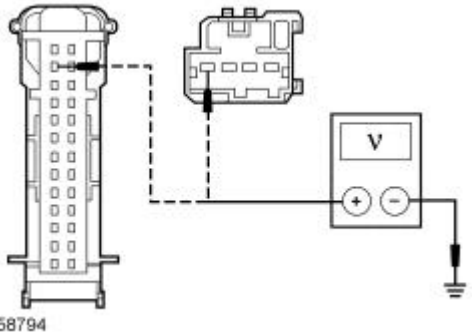
- **Is the resistance less than 5 ohms?**

Yes
GO to F7 .

No
REPAIR the circuit.
CLEAR the DTCs.
REPEAT the self-test.

F7 CHECK FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Power Liftgate Module C4174b (if equipped).
- Key in ON position.
- Measure the voltage between the liftgate latch C457-1, circuit CPL10 (GN/WH), harness side and ground; or between the power liftgate module C4174b-12, circuit CPL10 (GN/WH), harness side and ground.



N0058794

- **Is the voltage greater than 10 volts?**

Yes
GO to F8 .

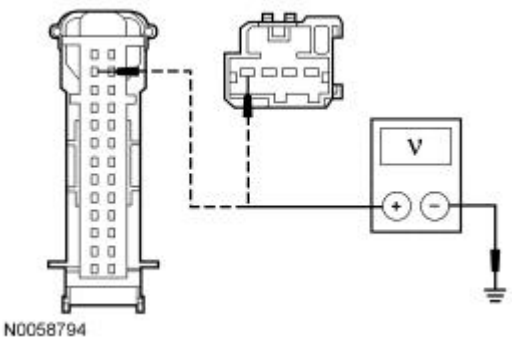
No
GO to F9 .

F8 CHECK CIRCUIT CPL10 (GN/WH) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: SJB C2280e.
- Key in ON position.
- Measure the voltage between the liftgate latch C457-1, circuit CPL10 (GN/WH), harness side and ground; or between the power liftgate module C4174b-12, circuit CPL10 (GN/WH), harness side and ground.

Yes
REPAIR the circuit.
TEST the system for normal operation.

No
GO to F15 .



N0058794

- **Is any voltage present?**

F9 CHECK FOR SJB OUTPUT	
• Key in OFF position. • Unlock the doors with the door lock control switch. • **NOTE:** The SJB only supplies voltage for the liftgate latch release momentarily. It is important to monitor the meter while activating the liftgate release switch. • While activating the liftgate release switch (pull the liftgate release handle), measure the voltage between the liftgate latch C457-1, circuit CPL10 (GN/WH), harness side and ground; or between the power liftgate module C4174b-12, circuit CPL10 (GN/WH), harness side and ground.  N0058794 • **Is the voltage greater than 10 volts when the switch is activated?**	**Yes** For a manual liftgate, INSTALL a new liftgate latch. REFER to Liftgate Latch in this section. CLEAR the DTCs. REPEAT the self-test. For a power liftgate, GO to F14 . **No** GO to F10 .
F10 CHECK CIRCUIT CPL10 (GN/WH) FOR AN OPEN	
• Disconnect: SJB C2280e. • Measure the resistance between the liftgate latch C457-1, circuit CPL10 (GN/WH), harness side and the SJB C2280e-15, circuit CPL10 (GN/WH), harness side; or between the power liftgate module C4174b-12, circuit CPL10 (GN/WH), harness side and the SJB C2280e-15, circuit CPL10 (GN/WH), harness side.  N0058795 • **Is the resistance less than 5 ohms?**	**Yes** GO to F15 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
F11 CHECK CIRCUIT GD150 (BK/WH) FOR AN OPEN (SWITCH)	
• Key in OFF position. • Disconnect: Liftgate Release Switch C4340.	**Yes** GO to F12 .

• Measure the resistance between the liftgate release switch C4040-1, circuit GD150 (BK/WH), harness side and ground.  N0058796 • **Is the resistance less than 5 ohms?**	**No** REPAIR the circuit. TEST the system for normal operation.
F12 CHECK THE LIFTGATE RELEASE SWITCH	
• Unlock the doors with the door lock control switch. • Connect a fused (5A) jumper wire between the liftgate release switch C4040-2, circuit CPL45 (BN), harness side and the liftgate release switch C4040-1, circuit GD150 (BK/WH), harness side.  N0058797 • **Does the liftgate latch release?**	**Yes** INSTALL a new liftgate release handle. REFER to Liftgate Release Handle in this section. TEST the system for normal operation. **No** LEAVE the jumper wire connected. GO to F13.
F13 CHECK CIRCUIT CPL45 (BN) FOR AN OPEN	
• Disconnect: SJB C2280d. • Measure the resistance between the SJB C2280d-7, circuit CPL45 (BN), harness side and ground.  N0060161 • **Is the resistance less than 5 ohms?**	**Yes** GO to F15. **No** REPAIR the circuit. TEST the system for normal operation.
F14 CHECK FOR CORRECT POWER LIFTGATE MODULE OPERATION	

• Disconnect all the power liftgate module connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the power liftgate module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new power liftgate module. REFER to Section 501-03. CLEAR the DTCs. REPEAT the self-test.
	
	No

	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
F15 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test G: The Doors Do Not Lock/Unlock Using The Keyless Entry Keypad

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends voltage signals to the keyless entry keypad through circuits CPK29 (GY/BU), CPK30 (VT/GN), and CPK31 (YE/GN). When a button is pressed on the keypad, one or more of the voltage signals is routed to ground through circuit GD133 (BK). Based on the input received, the SJB is able to determine which number on the keypad is pressed.

DTC B2A26 — is an on-demand DTC that sets when the SJB detects a short to ground from any of the keypad input circuits.

Possible Causes

- Circuit CPK29 (GY/BU) open or short to ground
- Circuit CPK30 (VT/GN) open or short to ground
- Circuit CPK31 (YE/GN) open or short to ground
- Circuit GD133 (BK) open
- Keyless entry keypad
- SJB

PINPOINT TEST G: THE DOORS DO NOT LOCK/UNLOCK USING THE KEYLESS ENTRY KEYPAD

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use correct probe adapter(s) may damage the connector.

</table>

Pinpoint Test H: The Keyless Entry Keypad Illumination Is Inoperative/Does Not Operate Correctly

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

When the smart junction box (SJB) detects a keyless entry button pressed, the SJB provides voltage to

the keyless entry keypad through circuit CPK28 (WH). Ground for the keyless entry keypad is provided through circuit GD143 (BK/VT).

DTC B1624 — is an on-demand DTC that sets when the SJB detects the keyless entry keypad illumination output circuit is open or short to voltage.

Possible Causes

- Circuit CPK28 (WH) open, short to ground or voltage
- Circuit GD143 (BK/VT) open
- Keyless entry keypad
- SJB

PINPOINT TEST H: THE KEYLESS ENTRY KEYPAD ILLUMINATION IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
H1 CHECK THE KEYLESS ENTRY KEYPAD OPERATION	
• Enter the security code to unlock the driver door. • **Does the driver door unlock using the keyless entry keypad?**	**Yes** GO to H2 . **No** Go To Pinpoint Test G .
H2 CHECK THE RECORDED SJB DTCs FROM THE ON-DEMAND SELF-TEST	
• Check the recorded results from the SJB self-test. • **Is DTC B1624 present?**	**Yes** GO to H3 . **No** GO to H6 .
H3 CHECK CIRCUIT GD143 (BK/VT) FOR AN OPEN	
• Key in OFF position. • Disconnect: Keyless Entry Keypad C500. • Measure the resistance between the keyless entry keypad C500-4, circuit GD143 (BK/VT), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** GO to H4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
H4 CHECK FOR CONSTANT VOLTAGE	
• Key in ON position.	**Yes**

• Measure the voltage between the keyless entry keypad C500-2, circuit CPK28 (WH), harness side and ground.  N0058823 • **Is any voltage present?**	GO to H5 . **No** GO to H6 .
H5 CHECK CIRCUIT CPK28 (WH) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: SJB C2280d. • Key in ON position. • Measure the voltage between the keyless entry keypad C500-2, circuit CPK28 (WH), harness side and ground.  N0058823 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to H9 .
H6 CHECK FOR SJB OUTPUT	
• Key in OFF position. • Measure the voltage between the keyless entry keypad C500-2, circuit CPK28 (WH), harness side and ground while connecting a fused (5A) jumper wire between the keyless entry keypad C500-1, circuit CPK29 (GY/BU), harness side and ground.  N0058805 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new keyless entry keypad. REFER to Keyless Entry Keypad in this section. CLEAR the DTCs. REPEAT the self-test. **No** If DTC B1624 was present, REMOVE the jumper wire. GO to H7 . If DTC B1624 was not present, REMOVE the jumper wire. GO to H8 .
H7 CHECK CIRCUIT CPK29 (WH) FOR AN OPEN	
• Disconnect: SJB C2280d. • Measure the resistance between the keyless entry keypad C500-2, circuit CPK29 (WH), harness side and the SJB C2280d-11, circuit CPK29 (WH), harness side.	**Yes** GO to H9 . **No** REPAIR the circuit. CLEAR the DTCs.

 N0058806 • **Is the resistance less than 5 ohms?**	REPEAT the self-test.
H8 CHECK CIRCUIT CPK29 (WH) FOR A SHORT TO GROUND	
• Disconnect: SJB . • Measure the resistance between the keyless entry keypad C500-2, circuit CPK29 (WH), harness side and ground.  N0058807 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to H9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
H9 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test I: The Doors Do Not Lock/Unlock Using The Remote Keyless Entry (RKE) Transmitter

Normal Operation

Remote locking and unlocking of the doors is accomplished by the smart junction box (SJB) receiving a command message from the RKE transmitter. The SJB energizes the appropriate relays to lock or unlock the doors

DTC B2276 — is a continuous DTC that sets when the SJB detects that there are no or only one RKE transmitter programmed.

Possible Causes

- RKE transmitter battery
- RKE transmitter
- RKE transmitter programming
- SJB

PINPOINT TEST I: THE DOORS DO NOT LOCK/UNLOCK USING THE REMOTE KEYLESS ENTRY (RKE) TRANSMITTER

NOTE: All RKE transmitters must be present to begin diagnosis of the RKE system.

NOTE: Aftermarket or dealer-installed systems may adversely affect the RKE system operation. These systems should be disconnected before diagnosing any RKE concerns.

Test Step	Result / Action to Take
I1 CHECK FOR THE CORRECT RKE TRANSMITTERS	
• **NOTE:** Make sure the RKE transmitters are ones provided with the original equipment manufacturer (OEM) system and not from an aftermarket system, or a dealer-installed system that may have been installed on the vehicle. • Check that the correct RKE transmitters are used with the vehicle. • **Are all the correct RKE transmitters present?**	**Yes** GO to I2 . **No** The system cannot be tested without the correct RKE transmitters. INFORM the customer that all the correct RKE transmitters must be present to proceed with diagnosis of the system.
I2 CHECK THE OPERATION OF THE RKE TRANSMITTER WITH THE KEY IN THE OFF POSITION	
• Key in OFF position. • Check the operation of the RKE transmitter. • **Does the system operate correctly now?**	**Yes** The system is operating as designed. INFORM the customer of the correct vehicle operation. **No** GO to I3 .
I3 CHECK THE POWER DOOR LOCK SYSTEM FOR CORRECT OPERATION	
• Verify the door lock/unlock operation by using the door lock control switch. • **Do all the doors lock and unlock correctly?**	**Yes** GO to I4 . **No** GO to Symptom Chart .
I4 CHECK FOR THE COMPLETE FUNCTIONALITY OF THE RKE TRANSMITTER (S)	
• Check all the RKE transmitter buttons for correct operation. • **Does the panic button operate correctly?**	**Yes** REPLACE the inoperative RKE transmitter. PROGRAM all RKE transmitters. REFER to Remote Keyless Entry Transmitter Programming in this section. INFORM the customer that any RKE transmitters not present need to be programmed. TEST the system for normal operation. **No**

	GO to I5 .
I5 MAKE SURE THE RKE TRANSMITTER SIGNAL IS BEING RECEIVED	
• Enter the following diagnostic mode on the diagnostic tool: SJB Function Test. • Monitor the RKE transmitter identification code (TIC) through the scan tool menus. • **NOTE:** The vehicle must be electronically unlocked prior to using any scan tools (through the door lock control switch). • Verify the RKE transmitter signal is being received. Using a scan tool, press a button on the RKE transmitter while observing the SJB TIC PID. • **Does the TIC show up on the scan tool screen when a button is pressed?**	**Yes** GO to I6 . **No** GO to I7 .
I6 CHECK IF THE RKE TRANSMITTERS ARE PROGRAMMED	
• Enter the following diagnostic mode on the diagnostic tool: SJB Function Test. • Monitor the RKE transmitter TIC PID through the scan tool menus. • Verify the RKE transmitters are programmed to the vehicle. • **Does the TIC displayed under RKE transmitter match any of the TICs stored in memory?**	**Yes** GO to I8 . **No** PROGRAM all of the RKE transmitters. REFER to Remote Keyless Entry Transmitter Programming in this section. INFORM the customer that any RKE transmitters not present need to be programmed. CLEAR the DTCs. REPEAT the self-test.
I7 CHECK THE RKE TRANSMITTER BATTERY	
• Using a thin coin, open the RKE transmitter. • Do not clean off any grease from the battery terminals on the back surface of the circuit board. • Verify the correct battery is used (CR2032). • Remove the RKE transmitter battery and measure the voltage. • **Is the voltage greater than 2.5 volts?**	**Yes** GO to I9 . **No** INSTALL a new battery (make sure the battery is seated correctly). DO NOT reprogram the RKE transmitters (weak or dead batteries do not erase TICs from memory). TEST the system for normal operation.
I8 CHECK IF THE RKE TRANSMITTER IS OUT OF SYNCHRONIZATION WITH THE SJB	
• Check the recorded results from the SJB self-test. • **Is continuous DTC B2425 present?**	**Yes** Go To Pinpoint Test J . **No** GO to I9 .
I9 CHECK FOR NORMAL OPERATION WITH A KNOWN GOOD RKE TRANSMITTER	
• Enter the following diagnostic mode on the diagnostic tool: SJB Function Test. • Monitor the RKE transmitter TIC/DATA through the scan tool menus. • Use the customer's second RKE transmitter (or a known good RKE transmitter that is programmed and correct for the vehicle), verify the RKE transmitter signal is being received by the SJB.	**Yes** REPLACE the inoperative RKE transmitter. PROGRAM all RKE transmitters. REFER to Remote Keyless Entry Transmitter Programming in this section. INFORM the customer that any RKE transmitters not present need to be programmed. TEST the system for normal operation.

• **Does the TIC show up on the scan tool when a button is pressed on the RKE transmitter?**	**No** GO to I10 .
I10 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test J: The Remote Keyless Entry (RKE) Transmitter Is Out Of Synchronization

Normal Operation

The remote keyless entry (RKE) transmitters and the smart junction box (SJB) use a rolling code to prevent the codes from being "captured" by a code grabber. The system advances the counter in the RKE transmitter and in the SJB every time an RKE transmitter button is pressed. All RKE transmitters must be present to begin diagnosis of the RKE system.

DTC B2425 — is a continuous DTC that sets when the SJB detects the rolling counter received from an RKE transmitter is 1,024 times greater than the rolling counter stored in the module.

Possible Causes

- RKE transmitter
- RKE transmitter button pressed a substantial amount of times while outside the range of the vehicle
- SJB

PINPOINT TEST J: THE REMOTE KEYLESS ENTRY (RKE) TRANSMITTER IS OUT OF SYNCHRONIZATION

NOTE: All RKE transmitters must be present to begin diagnosis of the RKE system.

Test Step	Result / Action to Take
J1 RESYNCHRONIZE THE INOPERATIVE RKE TRANSMITTER	
• Key in OFF position. • Press any button on the inoperative RKE transmitter 4 times consecutively within 30 seconds. • **Does the RKE transmitter operate correctly now?**	**Yes** The transmitter is now synchronized. CLEAR the DTCs. REPEAT the self-test. **No** GO to J2 .
J2 CHECK FOR A SECOND RKE TRANSMITTER	
• Check for another RKE transmitter that operates with the vehicle. • **Is there another RKE transmitter that operates with the vehicle?**	**Yes** GO to J3 . **No** GO to J4 .

J3 RESYNCHRONIZE THE INOPERATIVE RKE TRANSMITTER USING THE SECOND RKE TRANSMITTER	
• Key in OFF position. • Press any button on the operational RKE transmitter. • Within 30 seconds, press a button on the inoperative RKE transmitter. • Check the inoperative RKE transmitter for correct operation. • **Does the inoperative RKE transmitter operate now?**	**Yes** The transmitter is now synchronized. CLEAR the DTCs. REPEAT the self-test. **No** GO to J4 .
J4 PROGRAM THE INOPERATIVE RKE TRANSMITTER OR ALL THE RKE TRANSMITTERS	
• Program the inoperative RKE transmitter individually using a scan tool or program all RKE transmitters using the manual key cycle method. Refer to Remote Keyless Entry Transmitter Programming in this section. • **Does the inoperative RKE transmitter(s) operate now?**	**Yes** The transmitter(s) is now synchronized. INFORM the customer that any RKE transmitters not present need to be programmed. CLEAR the DTCs. REPEAT the self-test. **No** Go To Pinpoint Test I .

Pinpoint Test K: The Panic Feature Is Inoperative/Does Not Operate Correctly

Normal Operation

When the remote keyless entry (RKE) transmitter PANIC button is pressed, the smart junction box (SJB) activates the horn and the parking lamps.

Possible Causes

- Parking lamps system
- Horn system
- RKE transmitter
- SJB

PINPOINT TEST K: THE PANIC FEATURE IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
K1 VERIFY THE HORN OPERATION	
• Operate the horn through the steering wheel switch. • **Does the horn operate correctly?**	**Yes** GO to K2 . **No** REFER to Section 413-06 .
K2 VERIFY THE PARKING LAMP OPERATION	

• Place the headlamp switch in the PARKING LAMPS ON position. • **Do the parking lamps operate correctly?**	**Yes** GO to K3 . **No** REFER to Section 417-01 .
K3 CHECK THE RKE TRANSMITTER OPERATION	
• Unlock and lock the doors using the RKE transmitter. • **Do the doors lock and unlock correctly?**	**Yes** GO to K4 . **No** Go To Pinpoint Test I .
K4 CHECK THE RKE TRANSMITTER SIGNAL TO THE VEHICLE SECURITY MODULE	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: SJB Transmitter Panic Button PID. • Monitor the SJB transmitter panic button PID while pressing the panic button on the transmitter. • **Does the PID agree with the button press?**	**Yes** GO to K5 . **No** REPLACE the inoperative RKE transmitter. PROGRAM all RKE transmitter(s). REFER to Remote Keyless Entry Transmitter Programming in this section. INFORM the customer that any RKE transmitters not present need to be programmed. TEST the system for normal operation.
K5 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test L: The Remote Keyless Entry (RKE) Transmitter Has Poor Range Performance

Normal Operation

The RKE transmitter has a minimum operating range of 10 m (33 ft). The smart junction box (SJB) has an internal antenna to receive the RKE transmitter signal. When the SJB receives a command from a programmed transmitter, the SJB processes the command to provide the appropriate output.

Possible Causes

- Environmental interference
- RKE transmitter
- RKE transmitter battery
- SJB

PINPOINT TEST L: THE REMOTE KEYLESS ENTRY (RKE) TRANSMITTER HAS POOR RANGE PERFORMANCE

NOTE: All RKE transmitters must be present to begin diagnosis of the RKE system.

NOTE: Aftermarket or dealer-installed systems may adversely affect the RKE system operation. These systems must be disconnected before diagnosing any RKE concerns.

Test Step	Result / Action to Take
L1 CHECK FOR THE CORRECT RKE TRANSMITTERS	
• **NOTE:** Make sure the RKE transmitters are ones provided with the original equipment manufacturer (OEM) system and not from an aftermarket system, or a dealer-installed system, that may have been installed on the vehicle. • Check that the correct RKE transmitters are used with the vehicle. • **Are all the correct RKE transmitters present?**	**Yes** GO to L2 . **No** The system cannot be tested without the correct RKE transmitters. INFORM the customer that all the correct RKE transmitters must be present to proceed with diagnosis of the system.
L2 CHECK ALL RKE TRANSMITTERS FOR POOR RANGE PERFORMANCE	
• **NOTE:** The 3 m (10 ft) measurement of range is not the standard but is a guideline that clearly indicates a vehicle is experiencing poor range performance. • Check all RKE transmitters for poor range performance (less than 3 m [10 ft]). • **Do all RKE transmitters experience poor range?**	**Yes** GO to L4 . **No** GO to L3 .
L3 CHECK THE RKE TRANSMITTER BATTERY	
• Using a thin coin, open the RKE transmitter. • Do not clean off any grease from the battery terminals on the back surface of the circuit board. • Verify the correct battery is used (CR2032). • Remove the RKE transmitter battery and measure the voltage. • **Is the voltage greater than 2.5 volts?**	**Yes** REPLACE the inoperative RKE transmitter and PROGRAM all RKE transmitters. REFER to Remote Keyless Entry Transmitter Programming in this section. INFORM the customer that any RKE transmitters not present need to be programmed. TEST the system for normal operation. **No** INSTALL a new battery (make sure the battery is seated correctly). DO NOT reprogram the RKE transmitters (weak or dead batteries do not erase TICs from memory). TEST the system for normal operation.
L4 CHECK THE LOCATION OF THE VEHICLE AND THE APPROACH ANGLES AROUND THE VEHICLE	
• Make sure the poor performance is consistent in nature and is not from one approaching angle. • RKE transmitter range performance may be degraded in certain locations. For example, if the vehicle is within 0.5 miles (0.8 km) of high-power devices or radio/TV	**Yes** GO to L5 . **No** The system is operating correctly at this time. The range may have been affected by environmental interference.

towers, the operating distance of the transmitters may be reduced. • **Is the poor range performance consistent around the vehicle?**	
L5 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Remote Keyless Entry Transmitter Programming

Printable View (79 KB)

NOTE: All remote keyless entry (RKE) transmitters must be programmed at the same time.

NOTE: Programming (or reprogramming) of the RKE transmitters can be accomplished using a scan tool or by carrying out the following steps.

NOTE: Do not apply the brake pedal during this sequencing, as doing so ends the sequence and the transmitters will not be programmed.

1. Electronically unlock the door locks using the door lock control switch.

2. Turn the ignition switch from the OFF to the RUN position 8 times in rapid succession (within 10 seconds), with the eighth turn ending in RUN. If the module successfully enters program mode, it locks and then unlocks all the doors.

3. **NOTE:** If no action is taken within 20 seconds after a transmitter has been programmed, the programming sequence ends (the doors lock and unlock to confirm that programming is complete).

   Within 20 seconds, press any button on the RKE transmitter to be programmed. The doors lock and then unlock to confirm that each RKE transmitter is programmed. Repeat this step for each RKE transmitter.

4. Exiting the programming mode is accomplished if one of the following occurs:
   - The key transitions to the OFF position.
   - 20 seconds have passed since entering programming mode or since the last RKE transmitter was programmed.
   - The maximum number (4) of RKE transmitters have been programmed.

5. Check the operation of the transmitter. If the door locks do not respond for the programmed RKE transmitter(s), wait several seconds and press the button again. If the door locks still fail to respond, refer to Locks, Latches and Entry Systems in this section. (Make sure that no more than the maximum number of RKE transmitters are attempted to be programmed.)

Keyless Entry Keypad Code Programming

Printable View (78 KB)

NOTE: Up to 3 codes can be programmed. Once there are 3 programmed codes, any attempt to program additional codes will be unsuccessful.

1. Enter the permanent factory keyless entry keypad code.
2. **NOTE:** The locks should lock and unlock to indicate programming mode has been entered.

   Press the 1/2 button within 5 seconds to activate the programming mode. Holding the 1/2 button for more than 2 seconds after activation erases the stored customer codes.
3. Within 5 seconds, enter the new 5-digit keypad code. The doors lock and unlock to confirm the new code is programmed. If the locks do not lock and unlock, the new code programming has not been successful and the procedure must be started from the beginning.

Remote Memory Activation

Printable View (62 KB)

1. Move the seat, rear view mirrors, and adjustable pedals to the desired position.
2. Press the memory set switch SET button.
3. Within 5 seconds, press any button on the remote transmitter (except the PANIC button), and then press the appropriate memory set switch button.
4. Repeat Steps 1-3 for each remote transmitter to be programmed.

Remote Memory Deactivation

Printable View (62 KB)

1. Press the memory set switch SET button.
2. Within 5 seconds, press any button on the remote transmitter that is to be deactivated (except the PANIC button), and then press the memory set switch SET button.
3. Repeat Steps 1 and 2 for each remote transmitter to be deactivated from the memory setting.

Autolock and Horn Chirp Programming

Printable View (82 KB)

Programming the Autolock Feature Using the Door Lock Control Switch

NOTE: This feature can also be enabled or disabled using the message center switch functions, if equipped.

NOTE: The autolock feature can be enabled or disabled independently of the auto-unlock feature.

NOTE: The following steps must be carried out within 30 seconds or the procedure will need to be repeated. If the procedure needs to be repeated, wait 30 seconds between programming sessions.

1. Turn the ignition switch from the OFF to the RUN position.
2. Press the unlock button on the door lock control 3 times.
3. Turn the ignition switch from the RUN to the OFF position.
4. Press the unlock button on the door lock control switch 3 times.
5. Turn the ignition switch to the RUN position. The horn chirps one time to indicate that programming mode is entered.
6. **NOTE:** The lock and unlock buttons must be pressed within 5 seconds of each other.

   Within 30 seconds of entering the programming mode, press the unlock button on the door lock control switch then the lock button to enable/disable the autolock feature. The horn chirps once if the autolocks are disabled or a chirp followed by a honk if the autolocks are enabled.
7. Programming ends when the ignition switch state changes or times out after 2 minutes.

Programming the Auto-Unlock Feature Using the Door Lock Control Switch

NOTE: This feature can also be enabled or disabled using the message center switch functions, if equipped.

NOTE: The auto-unlock feature can be enabled or disabled independently of the autolock feature.

NOTE: The following steps must be carried out within 30 seconds or the procedure will need to be repeated. If the procedure needs to be repeated, wait 30 seconds between programming sessions.

1. Turn the ignition switch from the OFF to the RUN position.
2. Press the unlock button on the door unlock control 3 times.
3. Turn the ignition switch from the RUN to the OFF position.
4. Press the unlock button on the door lock control switch 3 times.
5. Turn the ignition switch to the RUN position. The horn chirps one time to indicate that programming mode is entered.

6. **NOTE:** The lock and unlock buttons must be pressed within 5 seconds of each other.

   Within 30 seconds of entering the programming mode, press the lock button on the door lock control switch then the unlock button to enable/disable the auto-unlock feature. The horn chirps once if the autolocks are disabled or a chirp followed by a honk if the autolocks are enabled.

7. Programming ends when the ignition switch state changes or times out after 2 minutes.

Programming the Perimeter Lighting Feature Using the Door Lock Control Switch

NOTE: The following steps must be carried out within 30 seconds or the procedure will need to be repeated. If the procedure needs to be repeated, wait 30 seconds between programming sessions.

1. Turn the ignition switch from the OFF to the RUN position.

2. Press the unlock button on the door unlock control 3 times.

3. Turn the ignition switch from the RUN to the OFF position.

4. Press the unlock button on the door unlock control switch 3 times.

5. Turn the ignition switch to the RUN position. The horn chirps one time to indicate that programming mode is entered.

6. **NOTE:** The lock and unlock buttons must be pressed within 5 seconds of each other.

   Within 30 seconds of entering the programming mode, press the lock button on the door lock control switch then the unlock button to enable/disable the perimeter lighting feature. The horn chirps once if the perimeter lighting is disabled or a chirp followed by a honk if the perimeter lighting is enabled.

7. Programming ends when the ignition switch state changes or times out after 2 minutes.

Programming the Autolock Feature Using the Keyless Entry Keypad

NOTE: The autolock feature can be enabled or disabled independently of the auto-unlock feature.

NOTE: The following steps must be carried out within 30 seconds or the procedure needs to be repeated. If the procedure needs to be repeated, wait 30 seconds between programming sessions.

1. Enter the factory set 5 digit entry code.

2. Press and hold the 3/4 button.

3. While holding the 3/4 button, press and release the 7/8 button.

4. Release the 3/4 button. The horn chirps once if the autolocks are disabled, or chirps once followed by a honk if the autolocks are enabled.

Programming the Auto-Unlock Feature Using the Keyless Entry Keypad

NOTE: The auto-unlock feature can be enabled or disabled independently of the autolock feature.

NOTE: The following steps must be carried out within 30 seconds or the procedure will need to be repeated. If the procedure needs to be repeated, wait 30 seconds between programming sessions.

1. Enter the factory set 5 digit entry code.

2. Press and hold the 3/4 button.

3. While holding the 3/4 button, press and release the 7/8 button twice.

4. Release the 3/4 button. The horn chirps once if auto-unlock is disabled, or chirps once followed by a honk if auto-unlock is enabled.

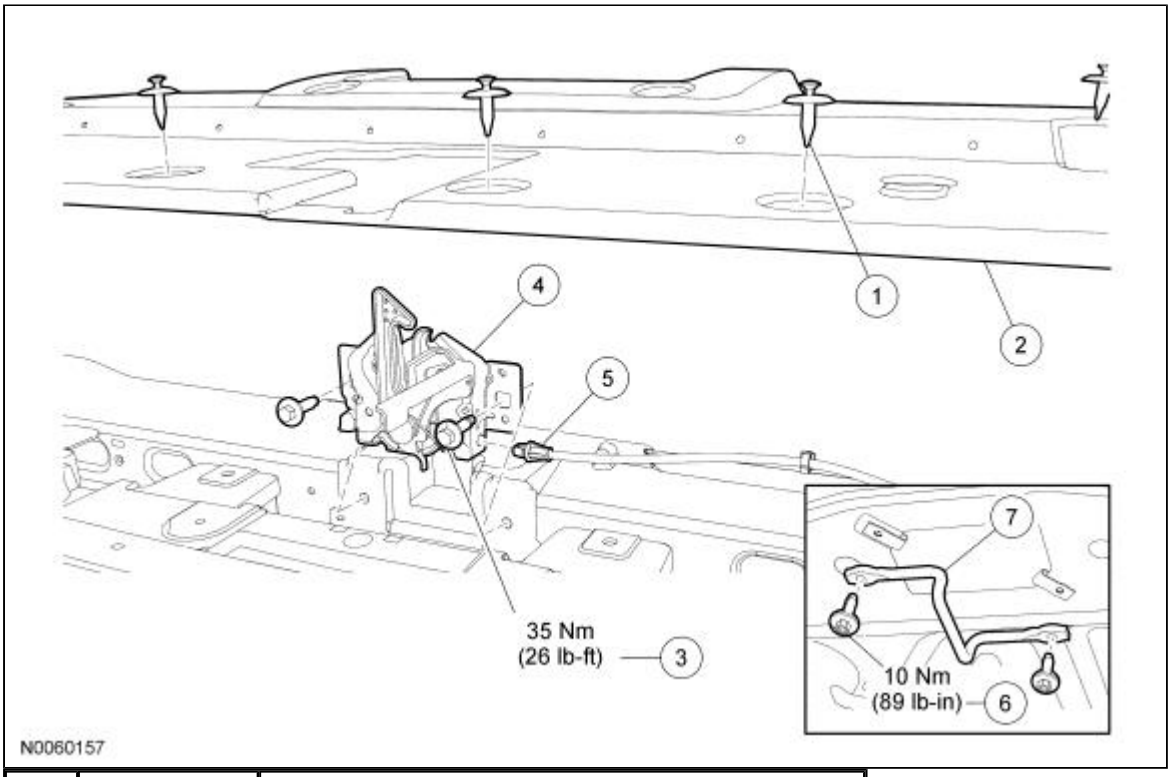
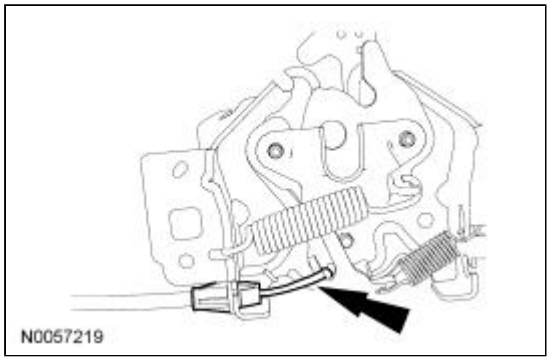
NOTE: Expedition shown, Navigator similar.



Item	Part Number	Description
1	N804837	Upper radiator sight shield pin-type (10 required)
2	19E525	Upper radiator sight shield
3	W711848	Hood latch bolts (2 required)
4	16700	Hood latch
5	—	Hood latch cable (part of 16916)
6	N807014	Hood striker bolts (2 required)
7	16K689	Hood striker

Removal and Installation

1. Remove the 10 pin-type retainers and the upper radiator sight shield.
2. Remove the 2 bolts and the hood latch.
   - To install, tighten to 35 Nm (26 lb-ft).
3. Release the hood latch cable from the hood latch.

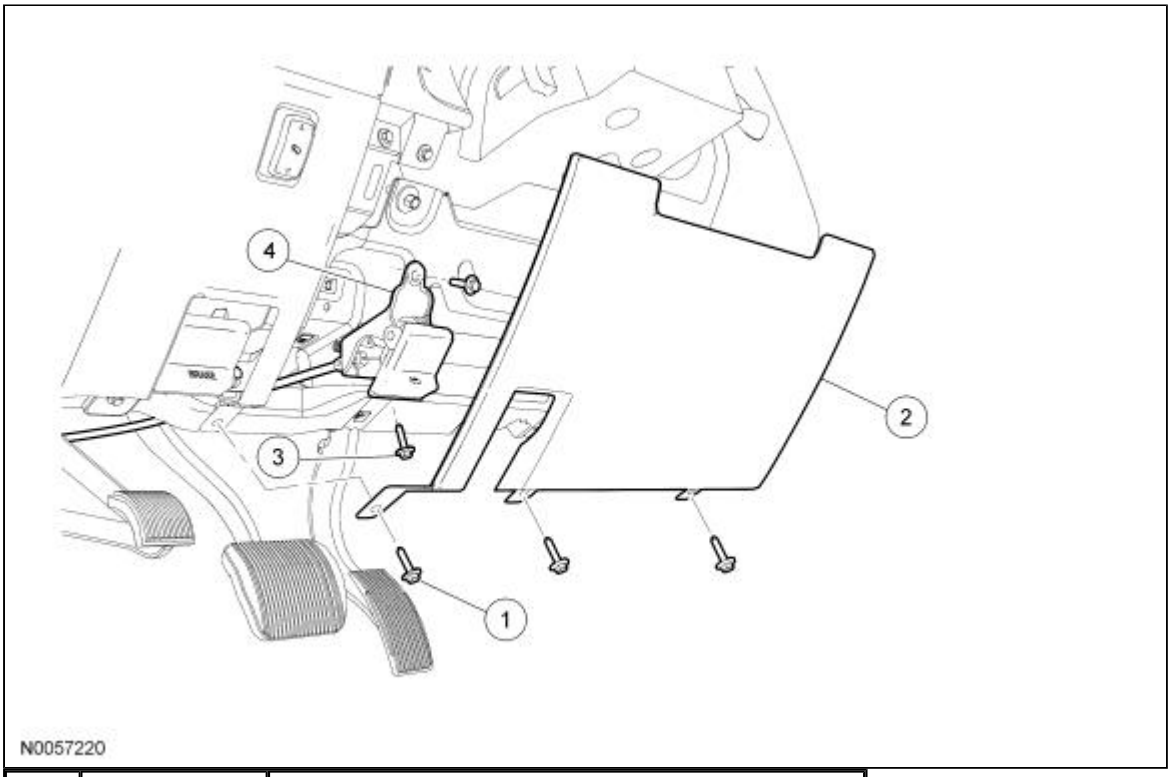


4. To install, reverse the removal procedure.
    - Verify the hood latch engages the striker in the latched position (secondary).
    - Verify the hood latch engages the striker in the fully latched position (primary).
    - Adjust the hood latch as necessary.

Hood Latch Release Handle

Printable View (189 KB)

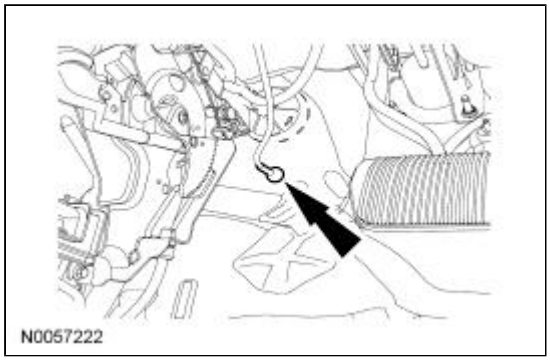
NOTE: Expedition shown, Navigator similar.



Item	Part Number	Description
1	W707628	Steering column cover screws (3 required)
2	7804459	Steering column cover
3	W707628	Hood latch release handle screws (2 required)
4	16916	Hood latch release handle

Removal and Installation

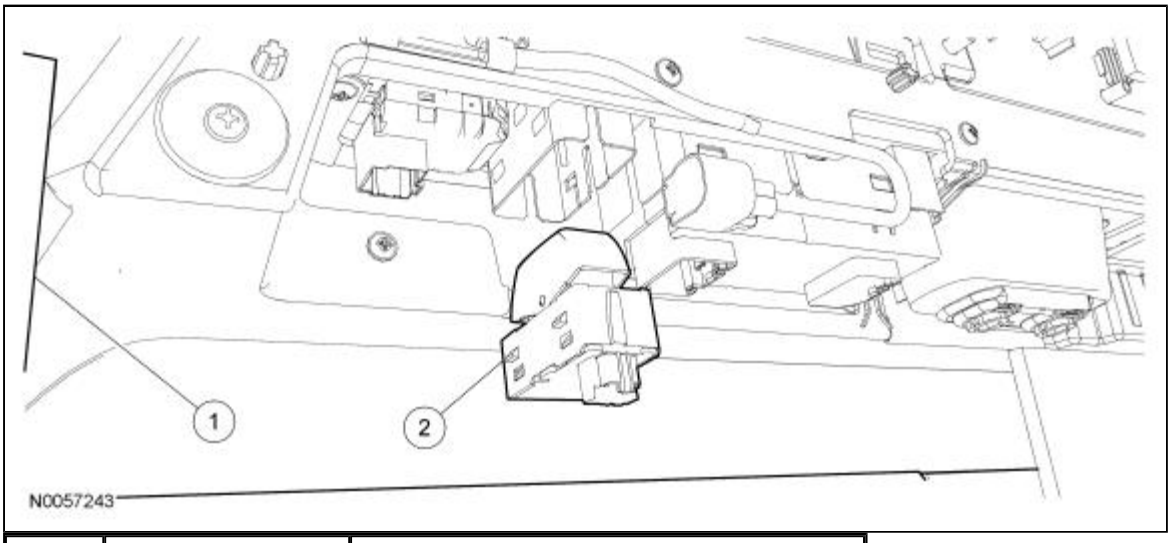
1. Remove the hood latch. For additional information, refer to Hood Latch in this section.
   - Note the routing of the hood release cable.
2. Remove the 3 screws and the steering column cover.
3. Remove the 2 screws and the hood latch release handle.
4. Release the cable guides and pull the cable through the cowl panel.



5. To install, reverse the removal procedure.

Door Lock Control Switch

Printable View (134 KB)



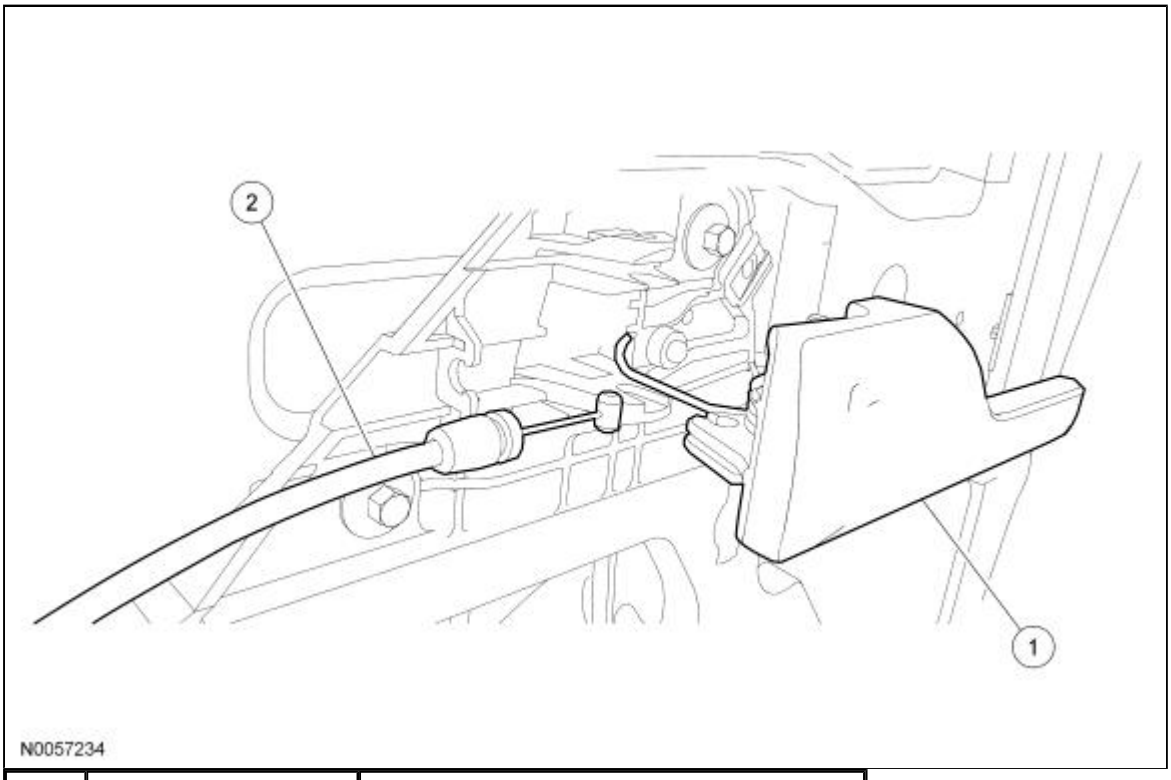
Item	Part Number	Description
1	23943/23942	Front door trim panel (LH/RH)
2	14A028	Door lock control switch

Removal and Installation

1. Remove the front door trim panel. For additional information, refer to Section 501-05 .
2. Release the tabs and remove the door lock control switch.
3. To install, reverse the removal procedure.

Interior Door Handle

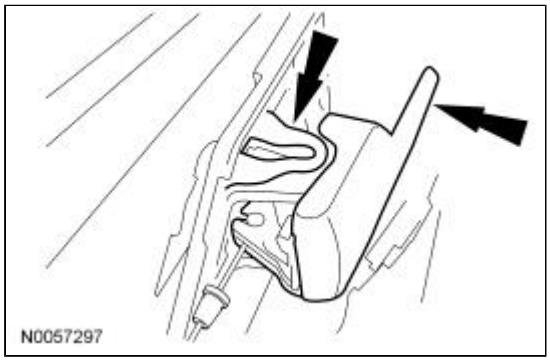
Printable View (163 KB)



Item	Part Number	Description
1	7821819/ 7821818	Interior door handle (LH/RH)
2	78221A00	Exterior door handle actuating cable

Removal and Installation

1. Remove the front or rear door trim panel. For additional information, refer to Section 501-05 .
2. Release the door handle retaining clip and position the interior door handle aside.



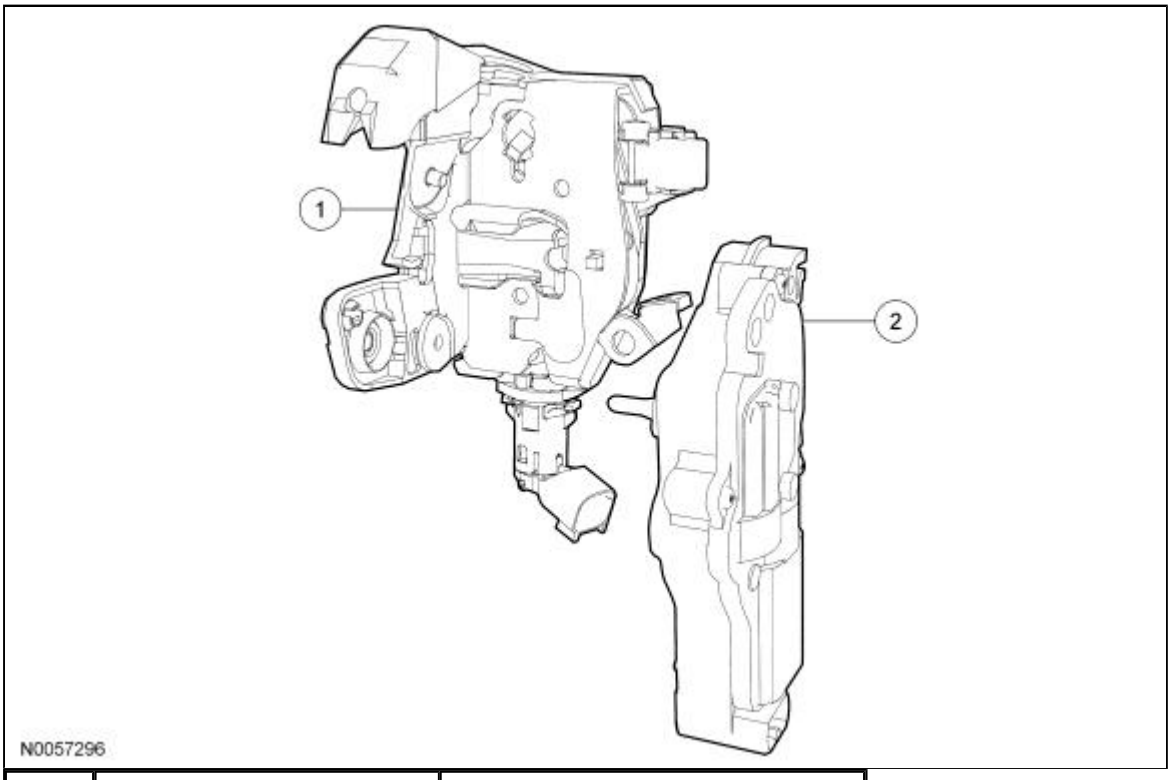
3. Release the interior door handle actuating cable from the interior door handle.
4. **NOTE:** Make sure the interior door handle spring is realigned before installation of the door

handle. Check for normal operation.

To install, reverse the removal procedure.

Door Lock Actuator

Printable View (119 KB)



Item	Part Number	Description
1	—	Door latch
2	25218A43/ 25218A42	Door lock actuator (LH/RH)

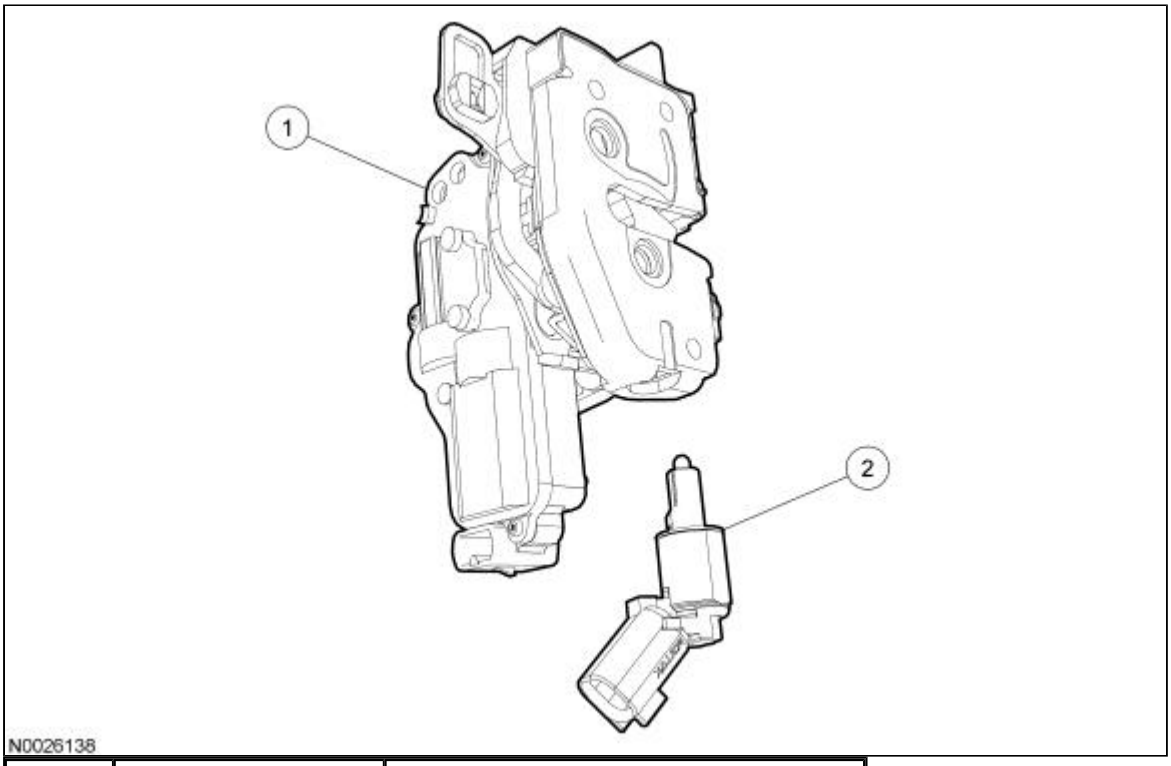
Removal and Installation

1. Remove the door latch. For additional information, refer to Front Door Latch or Rear Door Latch in this section.
2. Release the locking tab and remove the door lock actuator.
3. To install, reverse the removal procedure.

Door Ajar Switch

Printable View (129 KB)

NOTE: LH front door latch shown, others similar.



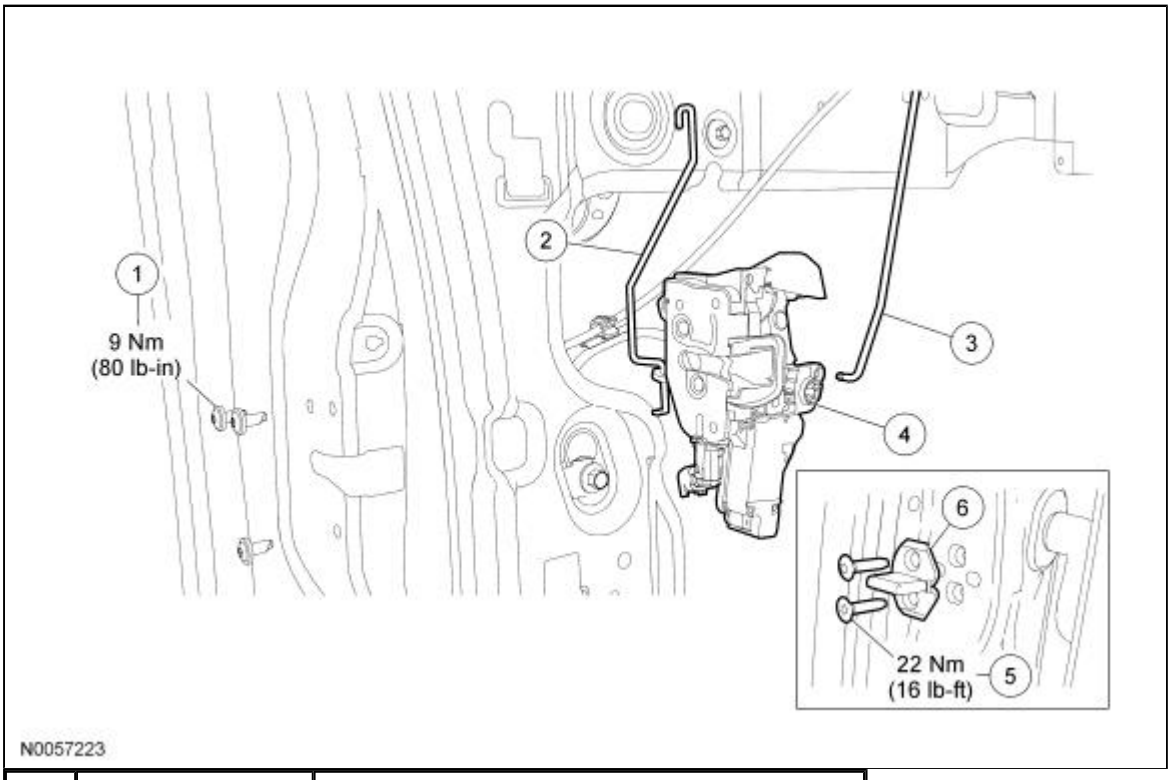
Item	Part Number	Description
1	—	Door latch
2	13713/14018	Door ajar switch (LH/RH)

Removal and Installation

1. Remove the door latch. For additional information, refer to Front Door Latch or Rear Door Latch in this section.
2. Release the locking tab and remove the door ajar switch.
3. To install, reverse the removal procedure.

Front Door Latch

Printable View (261 KB)



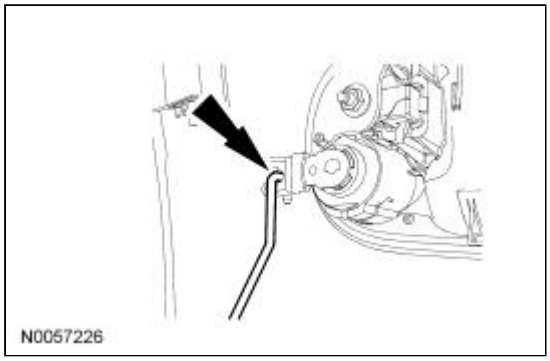
Item	Part Number	Description
1	N811471	Front door latch bolts (3 required)
2	7822135	Door lock cylinder actuating lock rod
3	7821853/ 7821852	Front door manual actuating lock rod (LH/RH)
4	1621813/ 1621812	Front door latch (LH/RH)
5	N807169	Front door striker bolts (2 required)
6	5422008	Front door striker

Removal and Installation

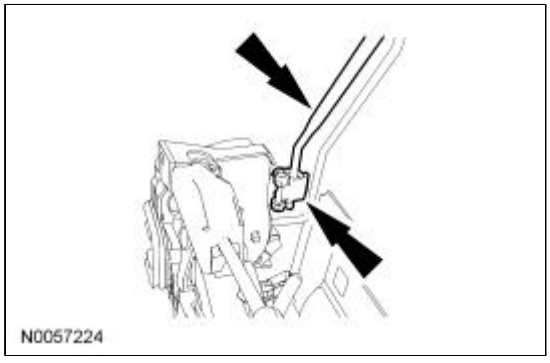
NOTE: The door glass must be completely raised.

1. Remove the front door trim panel. For additional information, refer to Section 501-05 .
   - Position the water shield aside.

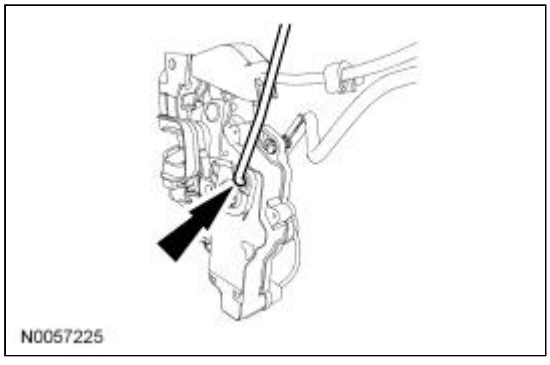
2. For the LH door, disconnect the door lock cylinder actuating lock rod from the lock cylinder.



3. Open the clip and disconnect the exterior door handle actuating rod.

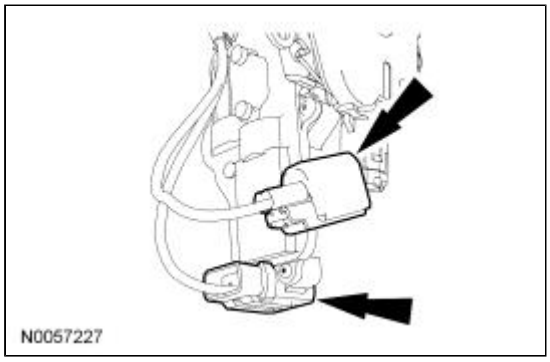


4. Disconnect the manual actuating lock rod from the door latch.

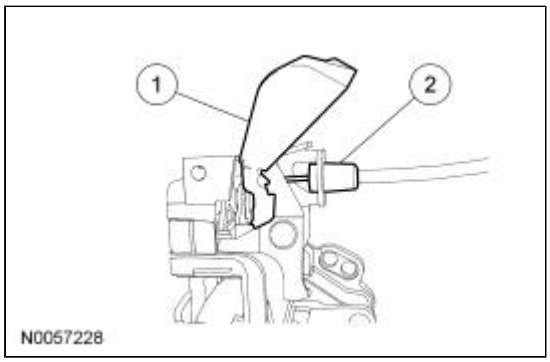


5. Remove and discard the 3 bolts and position the front door latch aside.
    - To install, tighten to 9 Nm (80 lb-in).

6. Disconnect the electrical connectors.
    - Separate the door harness from the door latch.



7. Release the interior door handle actuating cable and remove the front door latch.
    1. Position the cable cover aside.
    2. Release the conduit and the interior door handle actuating cable.

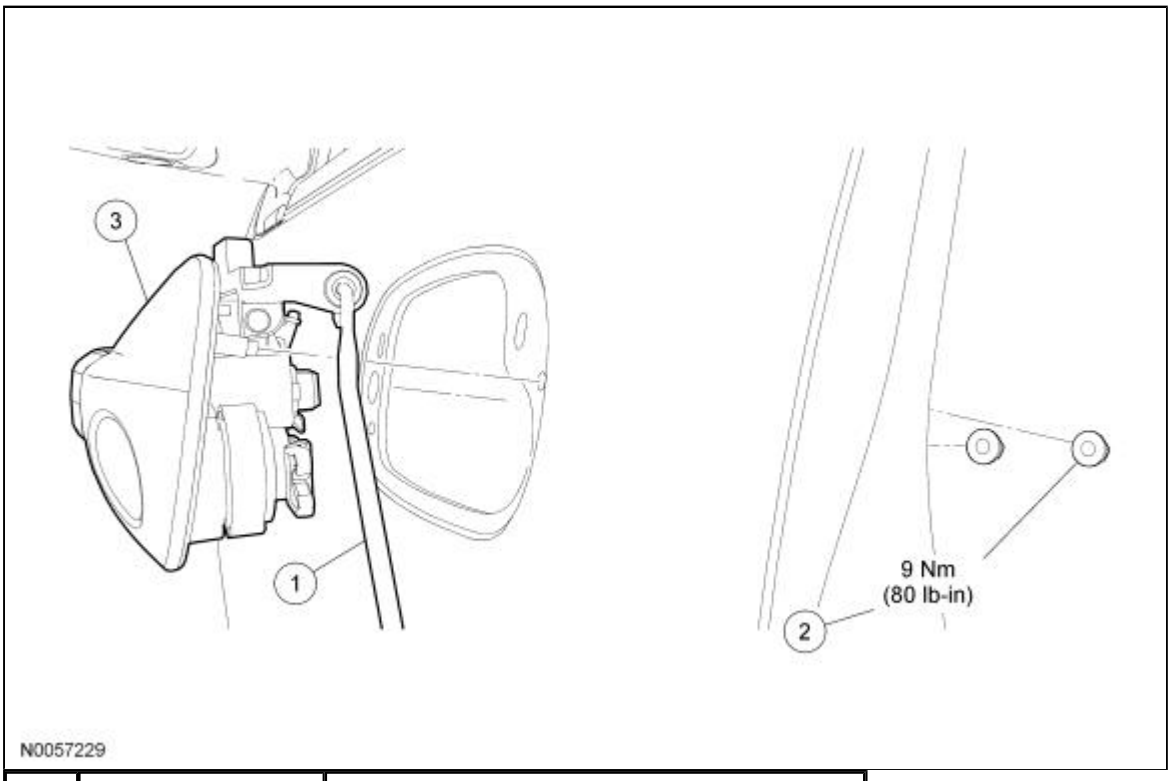


8. **NOTE:** Make sure the exterior door handle and the door handle actuating rod are in a relaxed position and that the exterior door handle rod is all the way up before closing the clip.

    To install, reverse the removal procedure.

Exterior Front Door Handle

Printable View (167 KB)



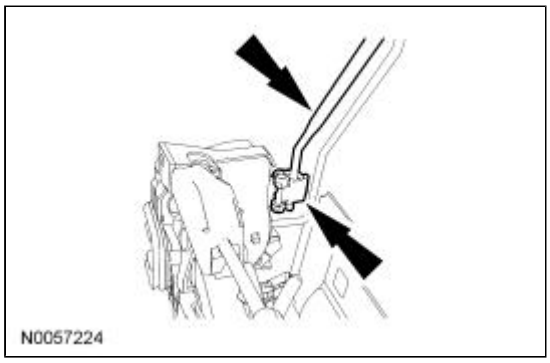
Item	Part Number	Description
1	7822153/ 7822152	Exterior door handle actuating rod (LH/RH)
2	—	Exterior door handle nuts (2 required)
3	7822405/ 7822404	Exterior door handle (LH/RH)

Removal and Installation

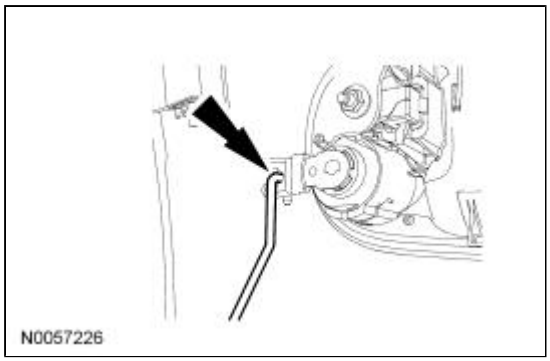
NOTE: The front door window glass must be completely raised.

1. Remove the front door trim panel. For additional information, refer to Section 501-05 .
   - Position the water shield aside.

2. Open the clip and disconnect the exterior door handle actuating rod.



3. If equipped, disconnect the door lock cylinder actuating rod from the lock cylinder.



4. **NOTE:** Push the exterior door handle out from the bottom surface of the handle.

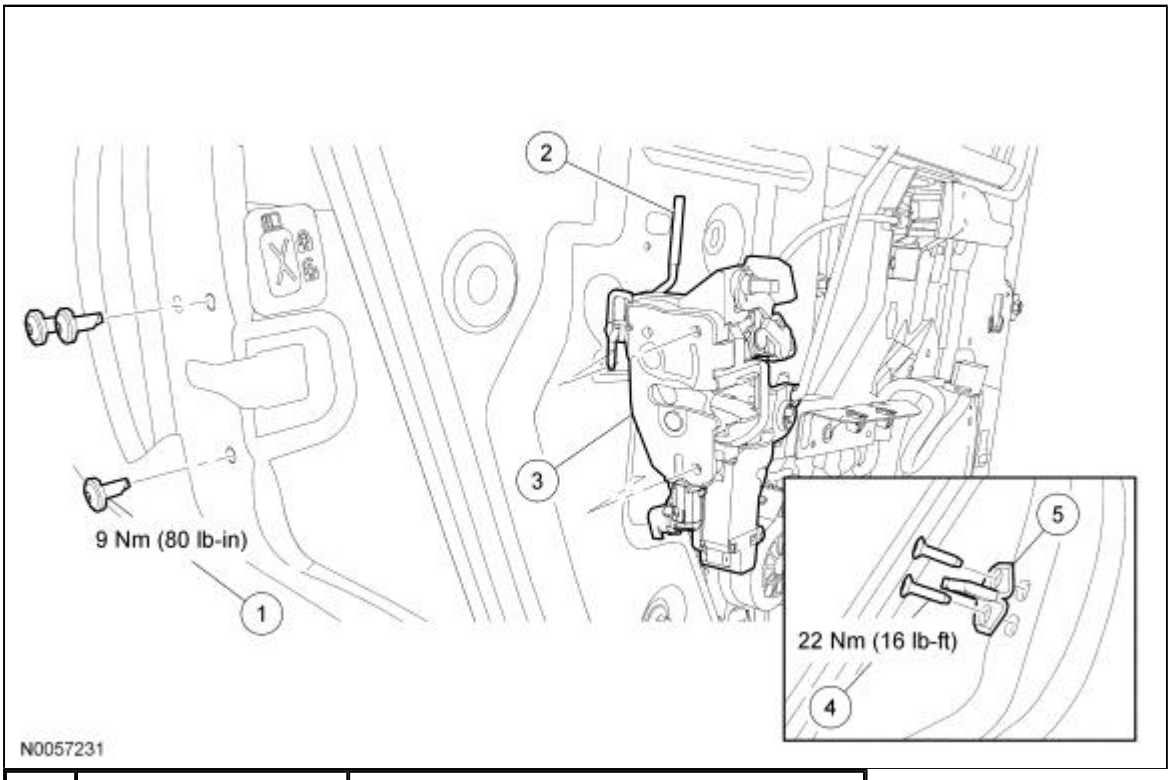
   Remove the 2 nuts and the exterior front door handle.
   - To install, tighten to 9 Nm (80 lb-in).

5. **NOTE:** Make sure the exterior door handle and the door handle actuating rod are in a relaxed position and that the exterior door handle rod is all the way up before closing the clip.

   To install, reverse the removal procedure.

Rear Door Latch

Printable View (249 KB)



Item	Part Number	Description
1	N811471	Rear door latch bolts (3 required)
2	7826597/ 7826596	Exterior door handle actuating rod (LH/RH)
3	78264A01/ 78264A00	Rear door latch (LH/RH)
4	N807169	Rear door striker bolts (2 required)
5	5422008	Rear door striker

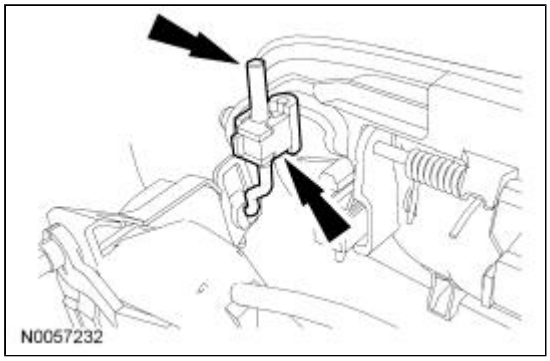
Removal and Installation

NOTE: The rear door window glass must be completely raised.

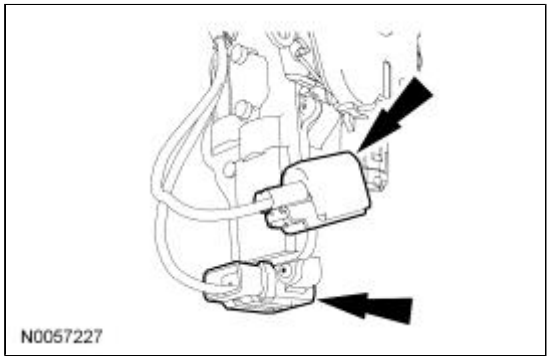
1. Remove rear door trim panel. For additional information, refer to Section 501-05 .
   - Position the water shield aside.

2. Remove and discard the 3 bolts and position the rear door latch aside.
   - To install, tighten to 9 Nm (80 lb-in).

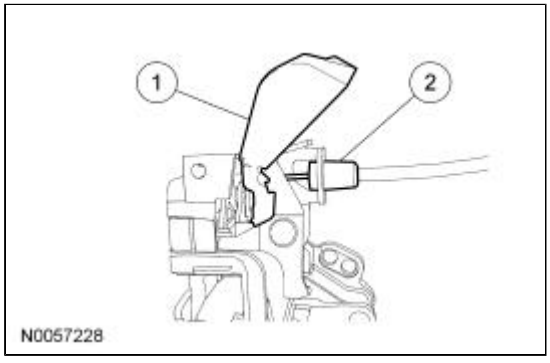
3. Open the clip and disconnect the exterior door handle actuating rod.



4. Disconnect the electrical connectors.



5. Release the interior door handle actuating cable and remove the rear door latch.
    1. Position the cable cover aside.
    2. Release the conduit and the interior door handle actuating cable.

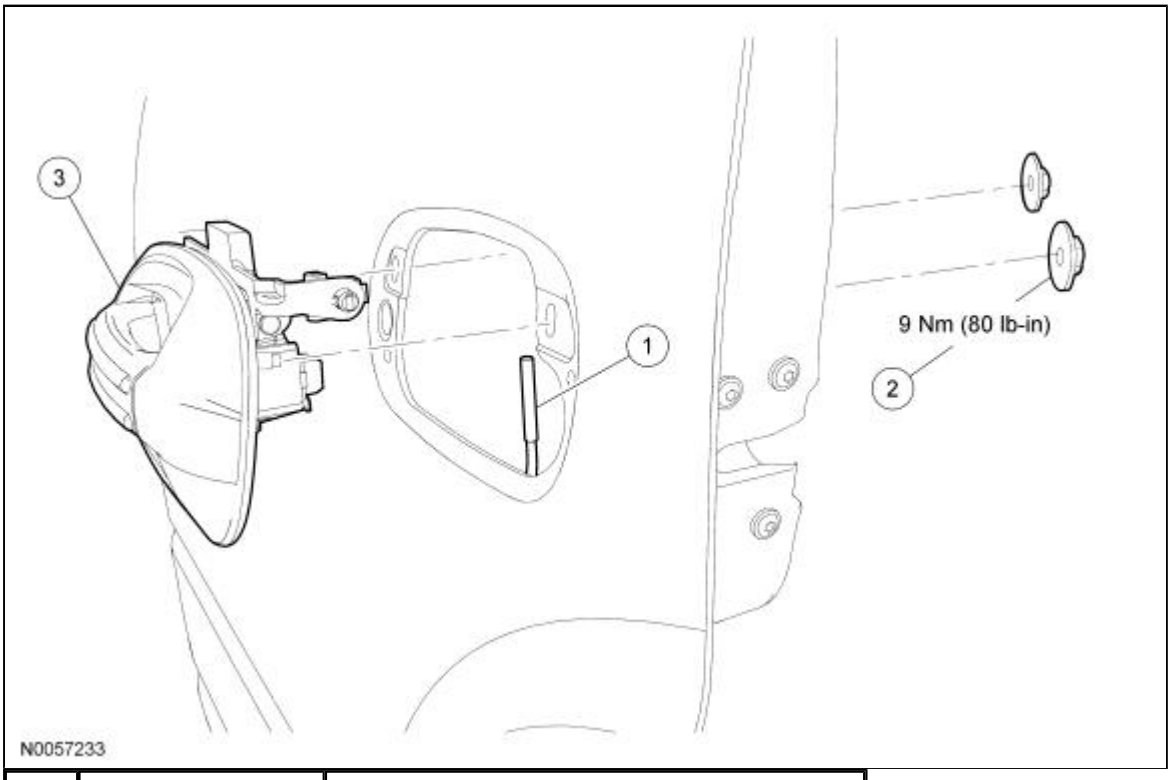


6. **NOTE:** Make sure the exterior door handle and the door handle actuating rod are in a relaxed position and that the exterior door handle rod is all the way up before closing the clip.

    To install, reverse the removal procedure.

Exterior Rear Door Handle

Printable View (157 KB)



Item	Part Number	Description
1	7826597/ 7826596	Exterior door handle actuating rod (LH/RH)
2	—	Exterior door handle nuts (2 required)
3	7826605/ 7826604	Exterior door handle (LH/RH)

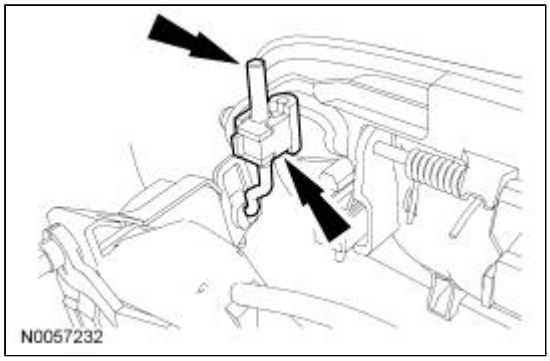
Removal and Installation

NOTE: The door glass must be completely raised.

1. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
   - Position the water shield aside.

2. Remove and discard the 3 bolts and position the rear door latch aside.
   - To install, tighten to 9 Nm (80 lb-in).

3. Open the clip and disconnect the exterior door handle actuating rod.



4. Remove the 2 nuts and the exterior rear door handle.
    - To install, tighten to 9 Nm (80 lb-in).

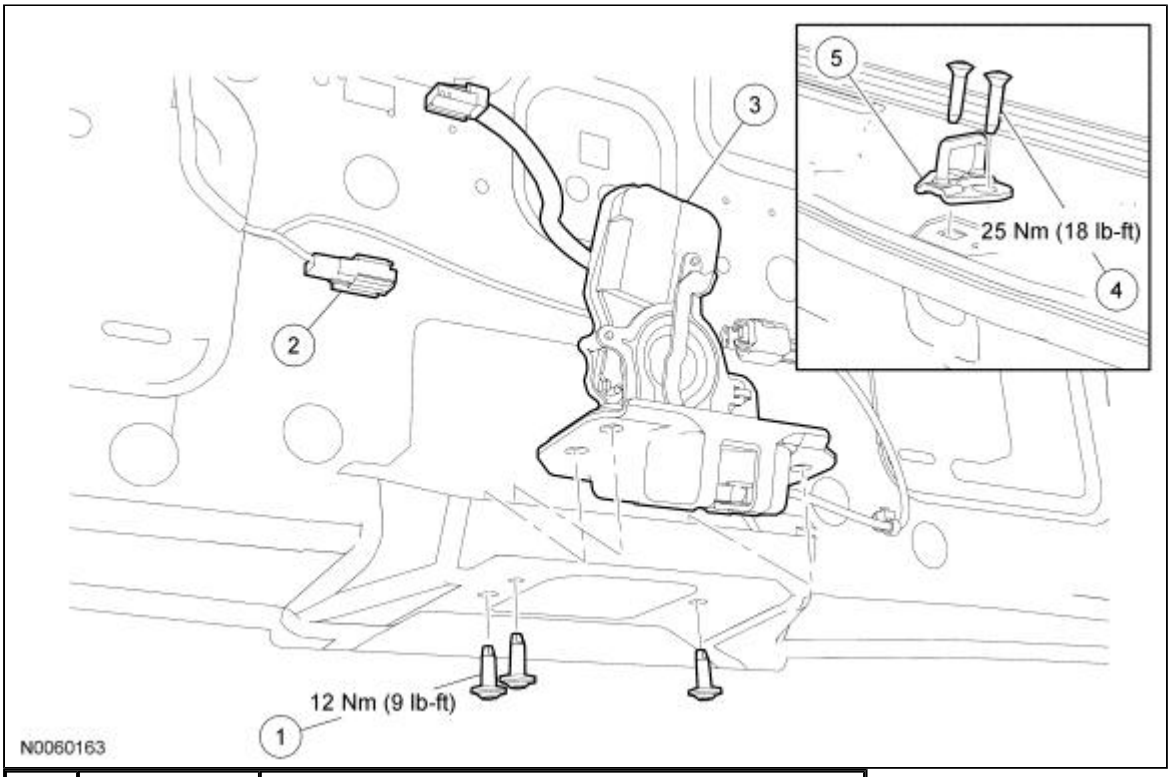
5. **NOTE:** Make sure the exterior door handle and the door handle actuating rod are in a relaxed position and that the exterior door handle rod is all the way up before closing the clip.

   To install, reverse the removal procedure.

Liftgate Latch

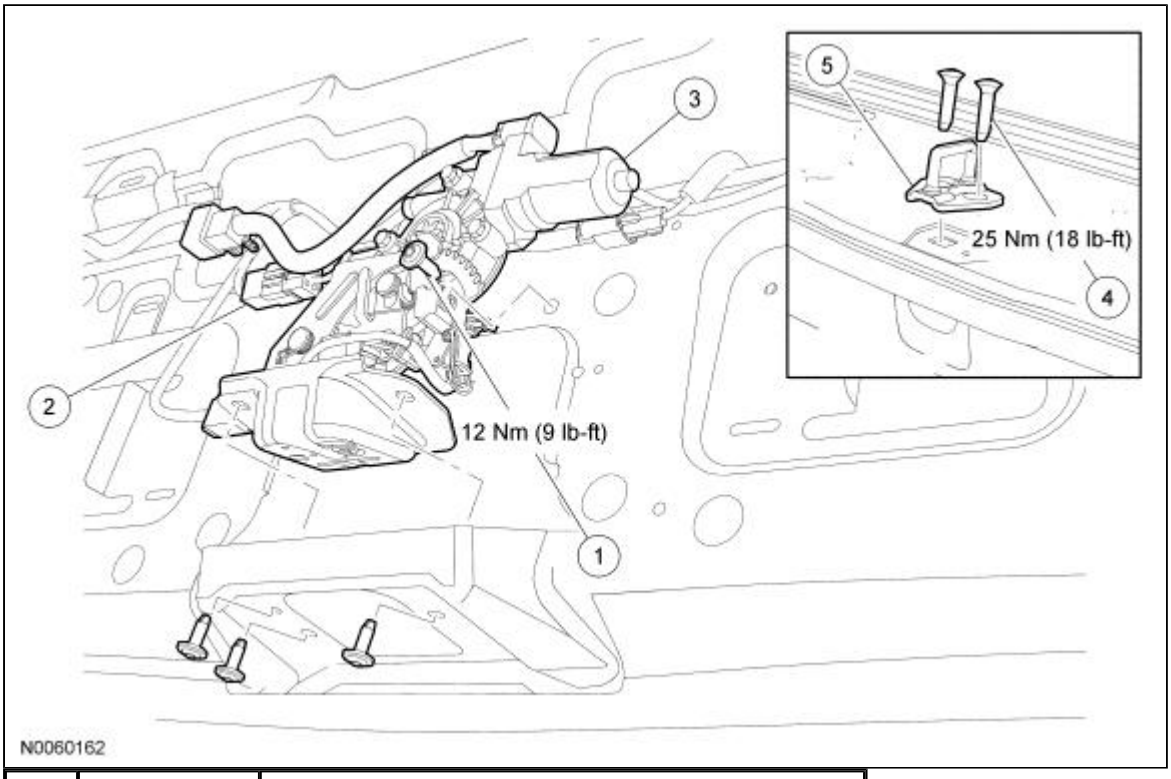
Printable View (266 KB)

Manual Liftgate



Item	Part Number	Description
1	N807675	Liftgate latch bolts (3 required)
2	—	Liftgate latch electrical connector (part of 14086)
3	7843150	Liftgate latch
4	N807169	Liftgate striker bolts (2 required)
5	784235	Liftgate striker

Power Liftgate



Item	Part Number	Description
1	N807675	Liftgate latch bolts (4 required)
2	—	Liftgate latch electrical connector (part of 14086)
3	7843150	Liftgate latch
4	N807169	Liftgate striker bolts (2 required)
5	784235	Liftgate striker

Removal and Installation

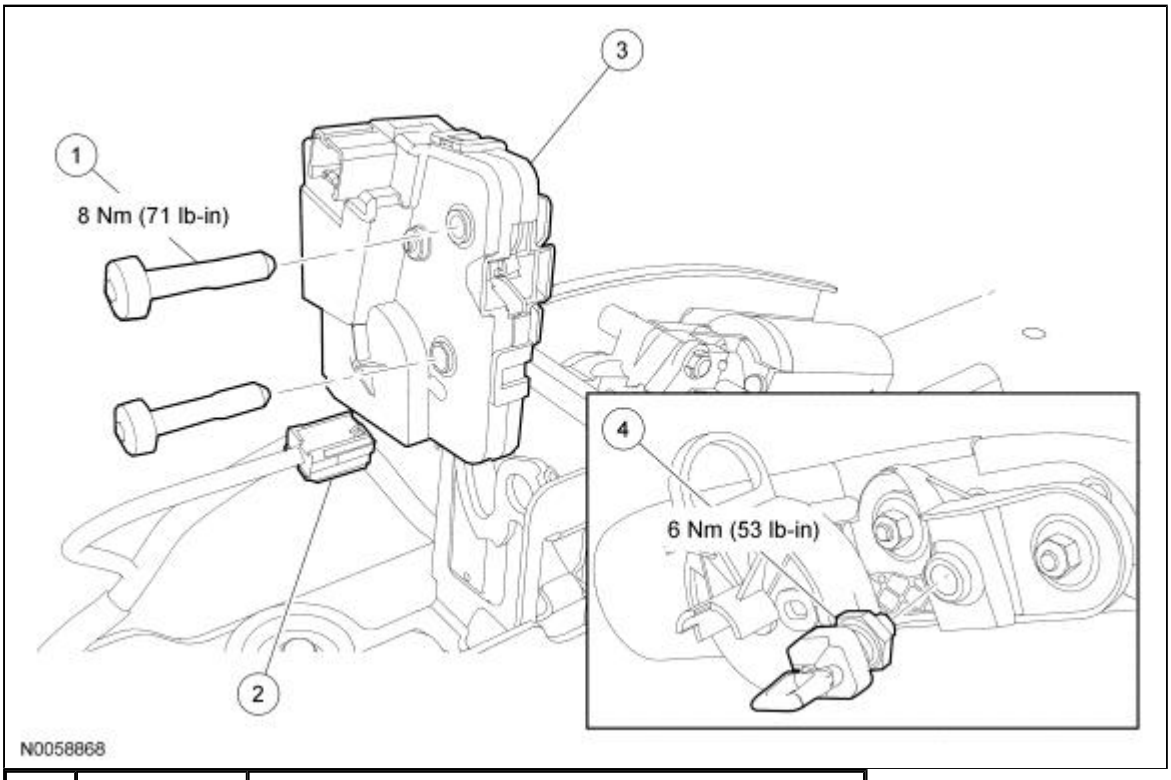
1. Remove the liftgate trim panel. For additional information, refer to Section 501-05 .
   - Position the water shield aside.

2. Remove and discard the 3 bolts (4 bolts if equipped with a power liftgate) and the liftgate latch.
   - Disconnect the electrical connector.
   - To install, tighten to 12 Nm (9 lb-ft).

3. To install, reverse the removal procedure.

Liftgate Latch — Window

Printable View (152 KB)



Item	Part Number	Description
1	—	Liftgate glass latch screws (2 required)
2	—	Liftgate glass latch electrical connector (part of 14086)
3	17C424	Liftgate glass latch
4	—	Liftgate glass striker

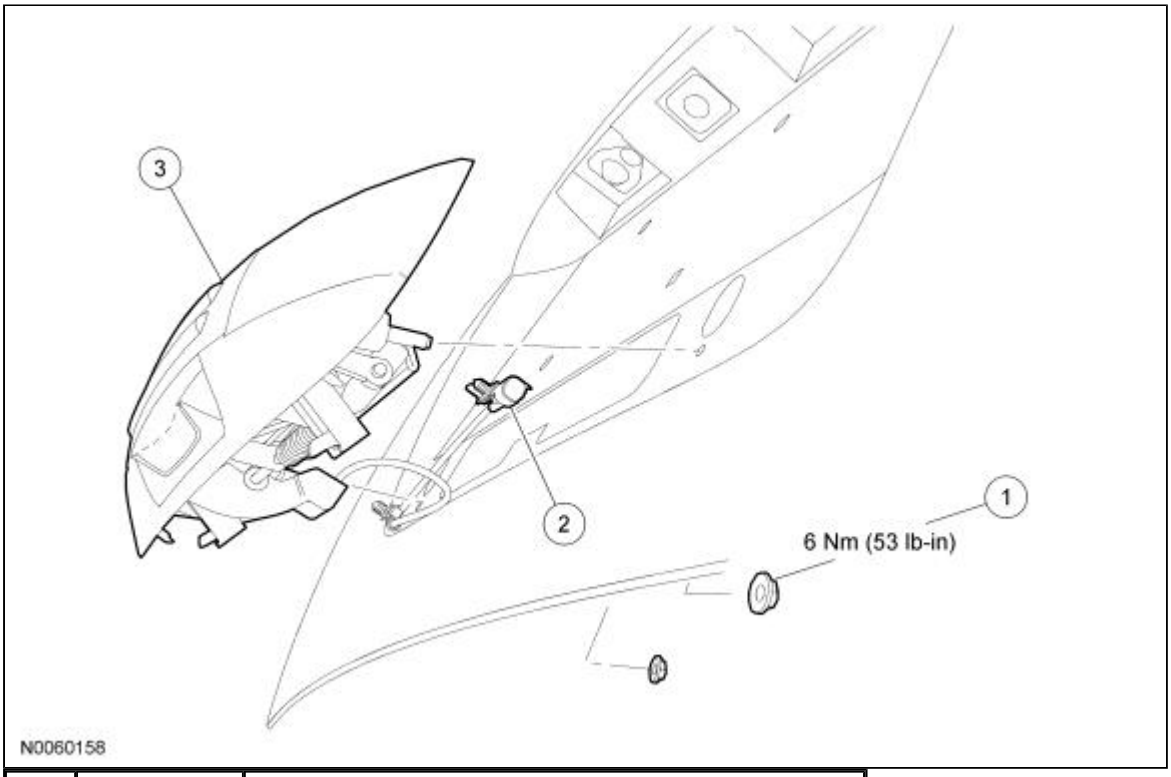
Removal and Installation

1. Remove the liftgate trim panel. For additional information, refer to Section 501-05 .
2. Remove the 2 screws and the liftgate window latch.
   - Disconnect the electrical connector.
   - To install, tighten to 8 Nm (71 lb-in).
3. To install, reverse the removal procedure.

Liftgate Release Handle

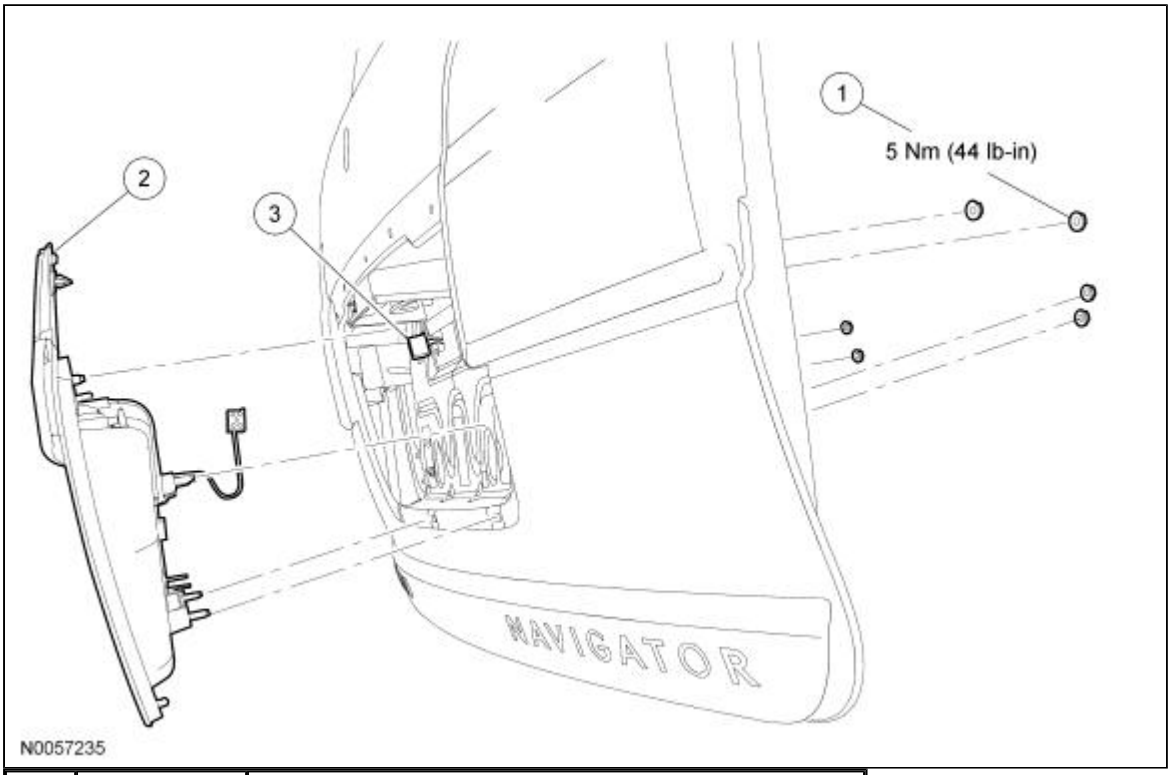
Printable View (276 KB)

Expedition



Item	Part Number	Description
1	—	Liftgate release handle nuts (2 required)
2	—	Liftgate release handle electrical connector (part of 78666C02)
3	78666C02	Liftgate release handle

Navigator



Item	Part Number	Description
1	N621906	License plate housing nuts (6 required)
2	78404C42	License plate housing
3	17C424	License plate housing electrical connector (part of 14086)

	Part	

Item	Number	Description
4	—	Liftgate release handle nuts (2 required)
5	—	Liftgate release handle electrical connector (part of 78666C02)
6	78666C02	Liftgate release handle

Removal and Installation

All vehicles

1. Remove the liftgate trim panel. For additional information, refer to Section 501-05 .
    - Position the water shield aside.

Expedition

2. Remove the 2 nuts and the liftgate release handle.
    - Disconnect the electrical connector.
    - To install, tighten to 6 Nm (53 lb-in).

Navigator

3. Remove the 6 nuts and the license plate housing.
    - Disconnect the electrical connector.
    - To install, tighten to 5 Nm (44 lb-in).

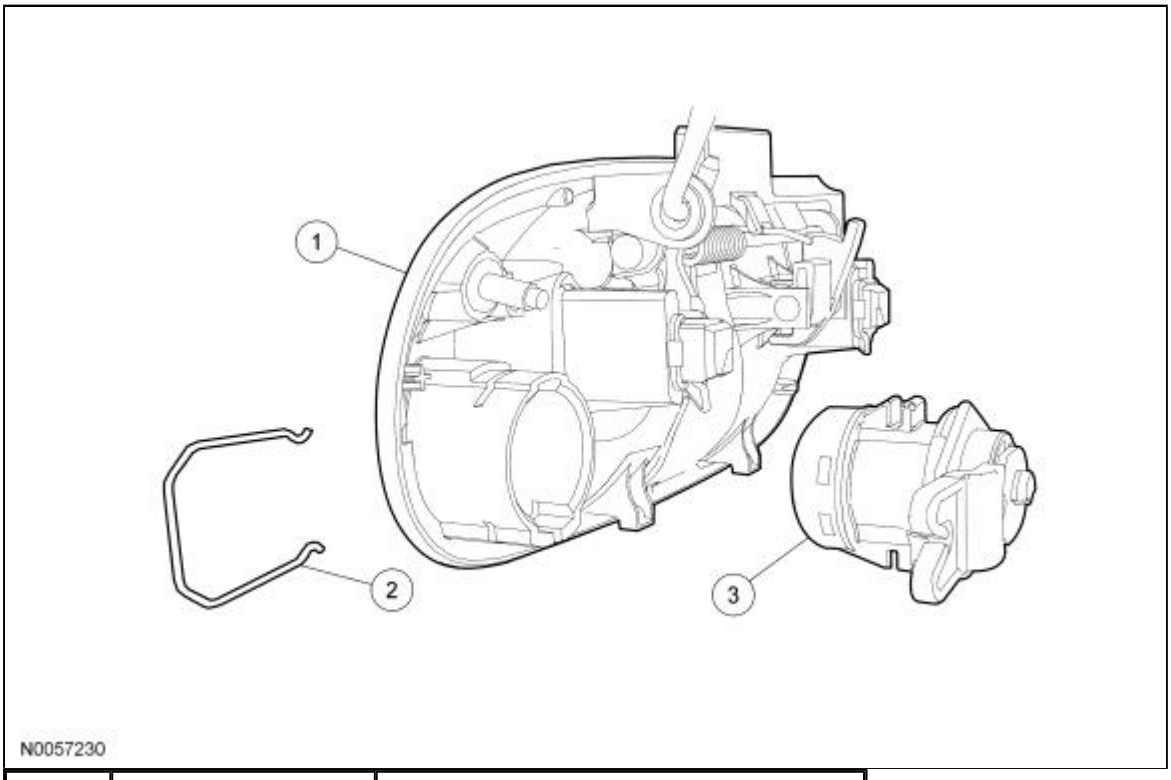
4. Remove the 2 nuts and the liftgate release handle.
    - Disconnect the electrical connector.
    - To install, tighten to 9 Nm (80 lb-in).

All vehicles

5. To install, reverse the removal procedure.

Door Lock Cylinder

Printable View (140 KB)



Item	Part Number	Description
1	7822405	Exterior door handle
2	7822404	Door lock cylinder retainer
3	7821991	Door lock cylinder

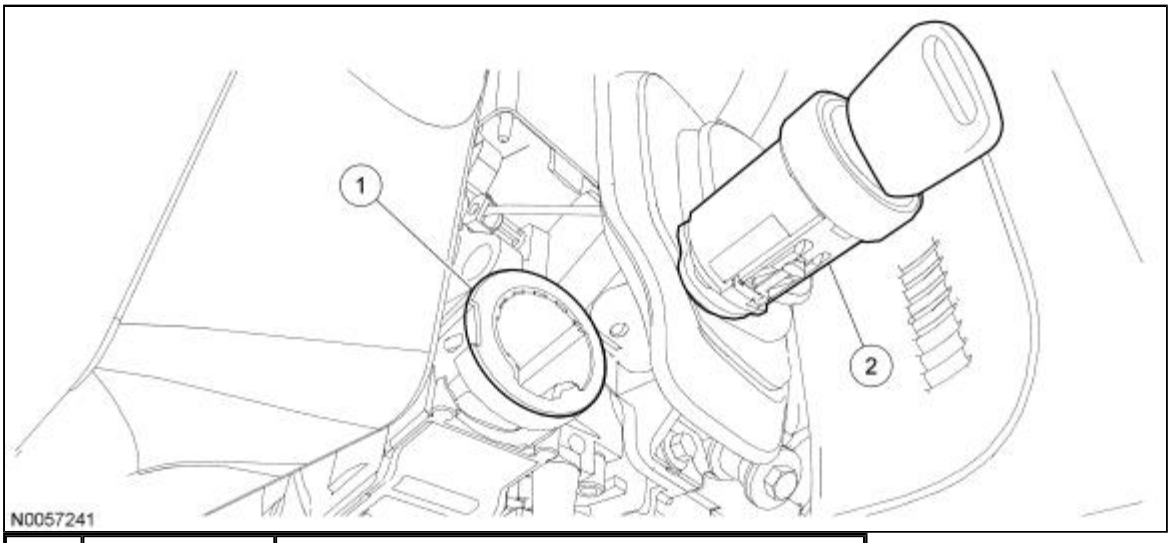
Removal and Installation

NOTE: Individual lock cylinders are repaired by discarding the inoperative lock cylinder and building a new lock cylinder using the appropriate lock repair package. The lock repair package includes a detailed instruction sheet to build the new lock cylinder to the current code of the vehicle.

1. Remove the exterior front door handle. For additional information, refer to Exterior Front Door Handle in this section.
2. Remove the retainer and the front door lock cylinder.
3. To install, reverse the removal procedure.

Ignition Lock Cylinder — Functional

Printable View (190 KB)



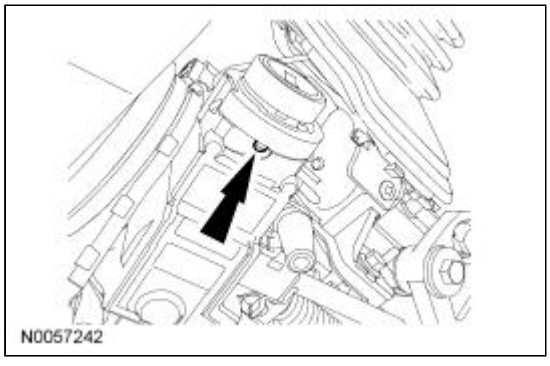
Item	Part Number	Description
1	—	Ignition lock cylinder housing (part of 3L529)
2	7822050	Ignition lock cylinder

Removal and Installation

1. Remove the passive anti-theft system (PATS) transceiver. For additional information, refer to Section 419-01 .

2. **NOTE:** The ignition lock cylinder must be in the RUN position.

   Using a suitable tool, press the release pin and remove the ignition lock cylinder.



3. To install, reverse the removal procedure.
   - Verify the ignition lock cylinder operation.

Ignition Lock Cylinder — Non Functional

Printable View (63 KB)

Removal

1. Remove the passive anti-theft system (PATS) transceiver. For additional information, refer to Section 419-01 .

2. Remove the ignition lock cylinder.
   - Use a 1/8-inch diameter drill bit to drill out the lock cylinder retaining pin.
   - Use a 3/8-inch diameter drill to drill down the middle of the ignition lock key slot until the ignition lock cylinder breaks loose.
   - Remove and discard the ignition lock cylinder and drill shavings from the steering column.

3. Remove the bearing retainer.

4. Remove the steering column lock housing bearing and steering column lock gear.

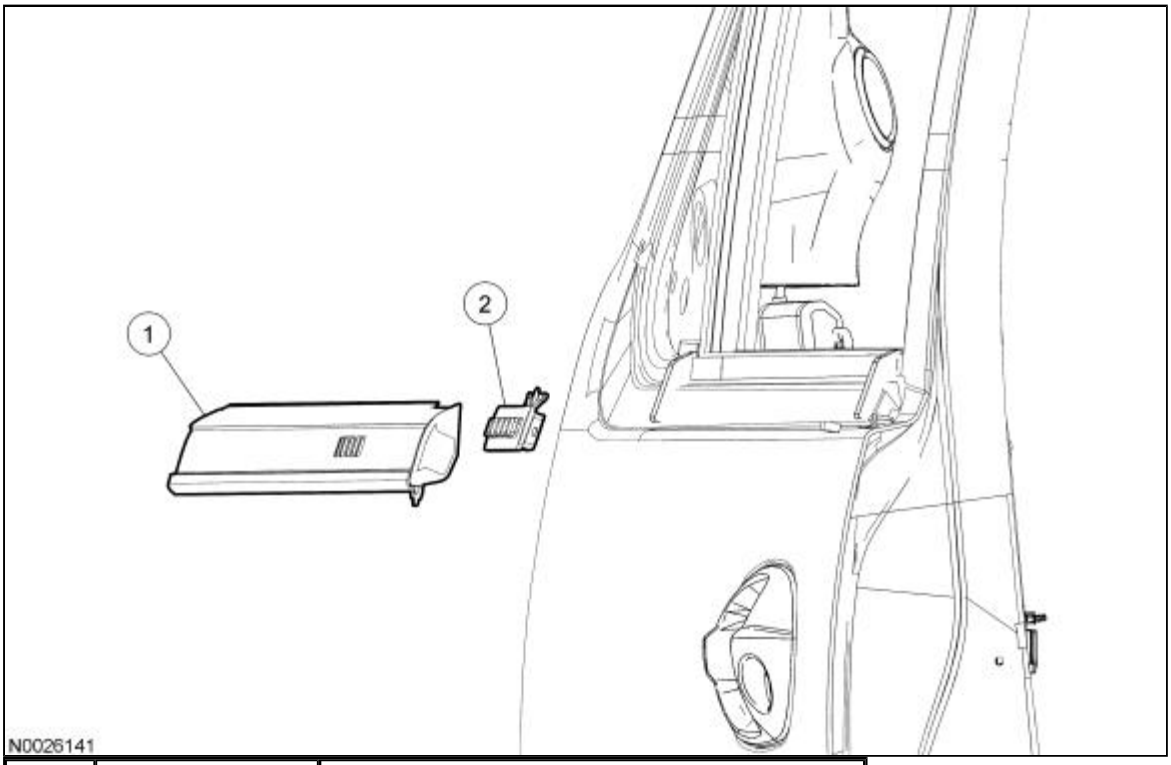
Installation

1. Thoroughly clean all drill shavings from the steering column and inspect it for damage.

2. Install a new ignition lock cylinder.
   - Verify the ignition lock cylinder operation.

Keyless Entry Keypad

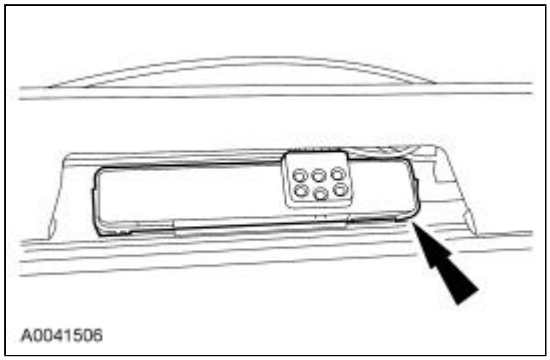
Printable View (141 KB)



Item	Part Number	Description
1	7821453	Front door outer glass weatherstrip
2	14A626	Keyless entry keypad

Removal and Installation

1. Remove the exterior mirror. For additional information, refer to Section 501-09 .
2. Remove the front door outer glass weatherstrip.
   - Disconnect the electrical connector.
3. Release the tabs and remove the keyless entry keypad.
   - Disconnect the keypad harness retaining clips from the weatherstrip.



4. To install, reverse the removal procedure.

Printable View (81 KB)

Wipers and Washers

Printable View (63 KB)

The wiper and washer system consists of the following components:

- Front windshield wiper motor
- Windshield wiper blades
- Windshield wiper pivot arms
- Windshield wiper mounting arm and pivot shaft
- Rear window wiper blade
- Rear window wiper motor
- Rear window wiper striker and wiper pivot shaft assembly
- Rear window wiper pivot arm
- Windshield washer fluid reservoir
- Windshield washer fluid pump
- Windshield wiper/washer switch (part of multi-function switch)

Windshield Wiper/Washer Switch

The windshield wiper/washer switch is an integral component of the steering column multi-function switch. Refer to Section 211-05 .

Wipers and Washers

Printable View (415 KB)

Special Tool(s)

ST1137-A	73III Digital Multimeter or equivalent 105-R0051
 ST1138-A	Flex Probe Kit 105-R025B or equivalent
ST1453-A	SABRE Premium Battery and Electrical System Tester 010-00736 or equivalent

Principles of Operation

The wiper motors receive inputs from the following:

- Multi-function switch
- Powertrain control module (PCM)
- Ignition switch
- Smart junction box (SJB)

The following components are integrated in the wiper motors:

- Windshield wiper motor module
- High/low speed relay
- Run/park relay
- Washer pump relay
- Park sense (Hall-effect sensor)

High Speed Windshield Wipers

High speed is activated when the windshield wiper/washer switch supplies a specific ground input to the windshield wiper motor module. The module then grounds the internal park/run relay and the internal HI/LO speed relay. Voltage is then sent to the high speed side of the wiper motor, which activates the high-speed mode. High speed mode is exited by selecting a different state on the switch. When the switch is placed in the OFF position, the motor continues to operate until the motor returns to the park position and the Hall-effect sensor senses the motor magnet. The output to the run/park relay deactivates the relay and disconnects the voltage to the motor.

Low Speed Windshield Wipers

Low speed is activated when the windshield wiper/washer supplies ground inputs to the windshield wiper motor module. The module then supplies ground for the run/park relay, which activates the relay, sending voltage to the low speed side of the motor, activating the low speed mode. Low speed mode is exited by selecting a different state on the switch. When the switch is placed in the OFF position, the motor continues to operate until the motor returns to the PARK position, and the Hall-effect sensor senses the motor magnet. The output to the run/park relay deactivates the relay and disconnects the voltage to the motor.

Intermittent Speed Windshield Wipers

The intermittent wiper speed is activated with grounds controlled by the multi-function switch inputs to the windshield wiper motor module. The windshield wiper motor module then activates the windshield wiper run/park relay coil and switches voltage through the windshield wiper high/low relay. The high/low relay remains deactivated, supplying the voltage to the wiper motor low speed input, and activates the windshield wiper motor. When the windshield wiper motor module receives the grounded input, the motor continues to operate until the Hall effect senses magnet, which turns OFF the run/park sense output to the windshield wiper run/park software, deactivating the relay and disconnecting voltage to the wiper motor. The windshield wipers remain parked until the windshield wiper motor module completes a time-out and then repeats the intermittent windshield wiper cycle.

Speed-Dependent Windshield Wipers

The windshield wiper motor module responds to the windshield wiper control commands by interpreting inputs from the PCM system. The speed-dependent wipers will compensate for the extra moisture that accumulates on the windshield at higher speeds, except when the multi-function switch is in the INT 1 position. At higher speeds, the speed-dependent feature shortens the delay between wipes when using the variable interval wipers. Delays will automatically adjust at speeds between 16 and 105 km/h (10 and 65 mph).

Intermittent Rear Window Wiper System

The rear window wiper intermittent speed is activated when the rear window wiper motor module receives ground controlled by the multi-function switch inputs to the rear window wiper motor module. The rear window wiper motor module then activates the rear window wiper relay (internal). This activates the rear window wiper motor by providing voltage from the smart junction box (SJB). Once the rear window wiper motor is activated, its internal run/park switch connects voltage to the motor, keeping it operating. When the rear window wiper motor returns to the PARK position, the run/park switch disconnects voltage internally from the wiper motor input. The rear window wiper remains parked until the rear window wiper motor module completes a time-out and then repeats the cycle.

Washer System

The windshield washer and the rear window washer are activated by the internal wiper motor modules when it receives a ground from the multi-function switch between the washer inputs. Depending on the correct ground, the internal wiper motor modules activate either the windshield washer or rear window washer relays (internal) by grounding the respective relay coil. When either module is activated, it connects voltage to the washer pump while the deactivated module provides ground to the washer pump. In this manner, voltage polarity is reversible to achieve directional change of the washer pump and washer fluid.

Software Safe Mode

The windshield wiper motor defaults to software safe mode when the run/park sensor does not sense the Hall-effect magnet inside the wiper motor. This can be caused by an obstruction of the windshield wipers, a binding linkage or loss of the Hall sensor signal. The motor continues to operate in a High/Low speed condition, and when turned off, the wipers immediately park on the windshield. If necessary, the wipers can be turned on and off until they return to the PARK position.

Inspection and Verification

1. Verify the customer concern by operating the system.

2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Windshield washer hoses
• Wiper linkage
• Multi-function switch
	• Smart junction box (SJB) fuses:
	  ▪ 19 (25A)
	  ▪ 43 (5A)
	  ▪ 45 (5A)
	  ▪ 49 (30A)
	• Circuitry
	• Windshield wiper motor
	• Rear wiper motor

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If cause is not visually evident, verify the symptom. GO to Symptom Chart .

Pinpoint Tests

Pinpoint Test A: The Wipers are Inoperative — Windshield

Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

Normal Operation

During normal operation, the windshield wiper motor receives voltage at all times through smart junction box (SJB) fuse 49 (30A), circuit SBB49 (RD). The windshield wiper motor also receives power with the ignition switch in RUN or ACC positions through SJB fuse 45 (5A), circuit CBP45 (YE). Ground is provided to the windshield wiper motor through circuit GD133 (BK) and circuit GD120 (BK/GN). The run/park and high/low relays are contained in the wiper motor electronics. Mode of operation is dependent on the signal(s) received from the multi-function switch.

Possible Causes

- Fuse(s)
- Multi-function switch
- Open in circuit CBP45 (YE), GD138 (BK/GN), SBB49 (RD), GD120 (BK/GN) or GD133 (BK)
- Ignition switch
- Windshield wiper motor

PINPOINT TEST A: THE WIPERS ARE INOPERATIVE — WINDSHIELD

Test Step	Result / Action to Take
A1 CHECK CIRCUITS SBB49 (RD) AND CBP45 (YE) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Windshield Wiper Motor C125. • Key in ON position. • Measure the voltage between windshield wiper C125-5, circuit SBB49 (RD), harness side and ground; and between windshield wiper motor C125-8, circuit CBP45 (YE), harness side and ground.  • **Are the voltages greater than 10 volts?**	**Yes** GO to A2 . **No** VERIFY the SJB fuse 45 (5A) and fuse 49 (30A) are OK. If OK, REPAIR the circuit(s) in question. TEST the system for normal operation.
A2 CHECK CIRCUITS GD120 (BK/GN) AND GD133 (BK) FOR OPENS	
• Key in OFF position. • Measure the resistance between windshield wiper C125-6, circuit GD120 (BK/GN), harness side and ground; and between windshield wiper motor C125-3, circuit GD133 (BK), harness side and ground.	**Yes** GO to A3 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.

 A0037610 • **Are the resistances less than 5 ohms?**	
A3 CHECK THE MULTI-FUNCTION SWITCH • Disconnect: Multi-function Switch C202. • Carry out the multi-function switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Did the multi-function switch pass the component test?**	**Yes** GO to A4 . **No** INSTALL a new multi-function switch. REFER to Section 211-05 .
A4 CHECK CIRCUIT GD138 (BK/WH) FOR OPEN • Measure the resistance between C202-15, circuit GD138 (BK/WH), harness side and ground.  N0052860 • **Is the resistance less than 5 ohms?**	**Yes** GO to A5 . **No** REPAIR the circuit. TEST the system for normal operation.
A5 CHECK FOR CORRECT WIPER MOTOR OPERATION • Disconnect all wiper motor connectors. • Check for: ▪ corrosion. ▪ pushed-out pins. • Connect all wiper motor connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** GO to A6 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.
A6 CHECK THE WINDSHIELD WIPER MOTOR • Key in OFF position. • Disconnect: Windshield Wiper Motor C125. • Carry out the windshield wiper motor component test as described in this section. • **Did the windshield wiper motor pass the component test?**	**Yes** The system is operating correctly at this time. Concern may have been caused by binding or incorrect pivot arm adjustment. REFER to Wiper Blade and Pivot Arm Adjustment — Windshield in this section. TEST the system

	for normal operation. **No** INSTALL a new windshield wiper motor. REFER to Wiper Motor — Windshield in this section.

Pinpoint Test B: The Wipers are Inoperative — Rear Window

Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

Normal Operation

During normal operation, the rear wiper motor receives voltage at all times through smart junction box (SJB) fuse 19 (25A), circuit SBP19 (BU/RD). The windshield wiper motor also receives power with the ignition switch in RUN or ACC positions through SJB fuse 43 (5A), circuit CBP43 (GY). Ground is provided to the windshield wiper motor through circuit GD150 (BK/WH). The run/park relay is contained in the rear wiper motor electronics. Mode of operation is dependent on the signal(s) received from the multi-function switch.

Possible Causes

- Fuse(s)
- Multi-function switch
- Open in circuit CBP43 (GY), SBP19 (BU/RD), CPL80 (WH/GN), GD138 (BK/WH) or GD150 (BK/WH)
- Ignition switch
- Rear window wiper motor

PINPOINT TEST B: THE WIPERS ARE INOPERATIVE — REAR WINDOW

Test Step	Result / Action to Take
B1 CHECK CIRCUITS CBP43 (GY) AND SBP19 (BU/RD) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Rear Wiper Motor C476. • Key in ON position. • Measure the voltage between rear wiper motor C476-3, circuit CBP43 (GY), harness side and ground; and between rear wiper motor C476-4, circuit SBP19 (BU/RD), harness side and ground.  A0039066 • **Are the voltages greater than 10 volts?**	**Yes** GO to B2 . **No** VERIFY SJB fuse 43 (5A) and fuse 19 (25A) are OK. If OK, REPAIR the circuit(s) in question. TEST the system for normal operation.
B2 CHECK CIRCUIT GD150 (BK/WH) FOR OPEN	

• Key in OFF position. • Measure the resistance between rear wiper C476-1, circuit GD150 (BK/WH), harness side and ground.  A0037614 • **Is the resistance less than 5 ohms?**	**Yes** GO to B3 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.
B3 CHECK THE MULTI-FUNCTION SWITCH	
• Key in OFF position. • Disconnect: Multi-function Switch C202. • Carry out the multi-function switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Did the multi-function switch pass the component test?**	**Yes** GO to B4 . **No** INSTALL a new multi-function switch. REFER to Section 211-05 .
B4 CHECK CIRCUIT GD138 (BK/WH) FOR AN OPEN	
• Measure the resistance between C202-15, circuit GD138 (BK/WH), harness side and ground.  N0052860 • **Is the resistance less than 5 ohms?**	**Yes** GO to B5 . **No** REPAIR the circuit. TEST the system for normal operation.
B5 CHECK CIRCUIT CPL80 (WH/GN) FOR AN OPEN	
• The liftgate glass must be closed. • Measure the resistance between C476-8, circuit CPL80 (WH/GN), harness side and ground.  A0051365 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B6 . **No** REPAIR the circuit. TEST the system for normal operation.
B6 CHECK FOR CORRECT WIPER MOTOR OPERATION	

• Disconnect all wiper motor connectors.
• Check for:
  ▪ liftgate glass open.
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all wiper motor connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	GO to B7 .
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

B7 CHECK THE REAR WINDOW WIPER MOTOR	
• Carry out the rear widow wiper motor component test as described in this section. • **Did the rear window wiper motor pass the component test?**	**Yes** The system is operating correctly at this time. Concern may have been caused by binding or incorrect pivot arm adjustment. REFER to Wiper Blade and Pivot Arm Adjustment — Rear in this section. TEST the system for normal operation. **No** INSTALL a new rear window wiper motor. REFER to Wiper Motor — Rear Window in this section.

Pinpoint Test C: The Wipers Stay on Continuously — Windshield

Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

Normal Operation

During normal operation, the windshield wiper motor receives voltage at all times through smart junction box (SJB) fuse 49 (30A), circuit SBB49 (RD). The windshield wiper motor also receives power with the ignition switch in RUN or ACC positions through SJB fuse 45 (5A), circuit CBP45 (YE). Ground is provided to the windshield wiper motor through circuit GD133 (BK) and circuit GD120 (BK/GN). The run/park and high/low relays are contained in the wiper motor electronics. Mode of operation is dependent on the signal(s) received from the multi-function switch.

Possible Causes

- Multi-function switch
- Short to ground in circuit CRW19 (BU/OG), CRW18 (VT/WH), CRW08 (VT/OG) or CRW17 (GN/VT)
- Windshield wiper motor

PINPOINT TEST C: THE WIPERS STAY ON CONTINUOUSLY — WINDSHIELD

Test Step	Result / Action to Take
C1 CHECK THE MULTI-FUNCTION SWITCH	
• Key in OFF position. • Disconnect: Multi-function Switch C202. • Carry out the multi-function switch component test.	**Yes** GO to C2 . **No**

Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Did the multi-function switch pass the component test?**	INSTALL a new multi-function switch. REFER to Section 211-05 .
C2 CHECK CIRCUITS CRW19 (BU/OG), CRW18 (VT/WH), CRW08 (VT/OG) OR CRW17 (GN/VT) FOR SHORTS	
• Disconnect: Windshield Wiper Motor C125. • Using the following table, measure the resistance between windshield wiper motor C125 harness side and ground: **Windshield Wiper Motor C125** / **Ground** Pin 10, circuit CRW19 (BU/OG) / Ground Pin 11, circuit CRW18 (VT/WH) / Ground Pin 1, circuit CRW08 (VT/OG) / Ground Pin 9, circuit CRW17 (GN/VT) / Ground  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C3 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.
C3 CHECK FOR CORRECT WIPER MOTOR OPERATION	

• Disconnect all wiper motor connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all wiper motor connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	GO to C4 .
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

C4 CHECK THE WINDSHIELD WIPER MOTOR	
• Key in OFF position. • Disconnect: Windshield Wiper Motor C125. • Carry out the windshield wiper motor component test as described in this section. • **Did the windshield wiper motor pass the component test?**	**Yes** The system is operating correctly at this time. Concern may have been caused by binding or incorrect pivot arm adjustment. REFER to Wiper Blade and Pivot Arm Adjustment — Windshield in this section. TEST the system for normal operation. **No** INSTALL a new windshield wiper motor. REFER to Wiper Motor —

	Windshield in this section.

Pinpoint Test D: The Wipers Stay on Continuously — Rear Window

Refer to Wiring Diagrams Cell 81 , Wipers and Washer for schematic and connector information.

Normal Operation

During normal operation, the rear wiper motor receives voltage at all times through smart junction box (SJB) fuse 19 (25A), circuit SBP19 (BU/RD). The windshield wiper motor also receives power with the ignition switch in RUN or ACC positions through SJB fuse 43 (5A), circuit CBP43 (GY). Ground is provided to the windshield wiper motor through circuit GD150 (BK/WH). The run/park relay is contained in the rear wiper motor electronics. Mode of operation is dependent on the signal(s) received from the multi-function switch.

Possible Causes

- Multi-function switch
- Short to ground in circuit CRW20 (GY/YE) or CRW21 (YE/VT)
- Rear window wiper motor

PINPOINT TEST D: THE WIPERS STAY ON CONTINUOUSLY — REAR WINDOW

Test Step	Result / Action to Take
D1 CHECK THE MULTI-FUNCTION SWITCH	
• Key in OFF position. • Disconnect: Multi-function Switch C202. • Carry out the multi-function switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Did the multi-function switch pass the component test?**	**Yes** GO to D2 . **No** INSTALL a new multi-function switch. REFER to Section 211-05 .
D2 CHECK CIRCUITS CRW20 (GY/YE) AND CRW21 (YE/VT) FOR SHORTS	
• Disconnect: Rear Window Wiper Motor C476. • Measure the resistance between rear window wiper motor C476-6, circuit CRW20 (GY/YE), harness side and ground; and between rear wiper motor C476-7, circuit CRW21 (YE/VT), harness side and ground.  • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to D3 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.
D3 CHECK FOR CORRECT WIPER MOTOR OPERATION	

• Disconnect all wiper motor connectors.
• Check for:
  ▪ liftgate glass open.
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all wiper motor connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	GO to D4 .
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

D4 CHECK THE REAR WINDOW WIPER MOTOR	
• Carry out the rear window wiper motor component test as described in this section. • **Did the rear window wiper motor pass the component test?**	**Yes** The system is operating correctly at this time. Concern may have been caused by binding or incorrect pivot arm adjustment. REFER to Wiper Blade and Pivot Arm Adjustment — Rear in this section. TEST the system for normal operation. **No** INSTALL a new rear window wiper motor. REFER to Wiper Motor — Rear Window in this section.

Pinpoint Test E: The High/Low Wiper Speeds Do Not Operate Correctly — Windshield

Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

Normal Operation

During normal operation, the windshield wiper motor receives voltage at all times through smart junction box (SJB) fuse 49 (30A), circuit SBB49 (RD). The windshield wiper motor also receives power with the ignition switch in RUN or ACC positions through SJB fuse 45 (5A), circuit CBP45 (YE). Ground is provided to the windshield wiper motor through circuit GD133 (BK) and circuit GD120 (BK/GN). The run/park and high/low relays are contained in the wiper motor electronics. Mode of operation is dependent on the signal(s) received from the multi-function switch.

Possible Causes

- Multi-function switch
- Open or short to ground in circuit CRW19 (BU/OG), CRW08 (VT/OG) or CRW 17 (GN/VT)
- Windshield wiper motor

PINPOINT TEST E: THE HIGH/LOW WIPER SPEEDS DO NOT OPERATE CORRECTLY — WINDSHIELD

Test Step	Result / Action to Take
E1 CHECK THE MULTI-FUNCTION SWITCH	
• Key in OFF position. • Disconnect: Multi-function Switch C202. • Carry out the multi-function switch component test.	**Yes** GO to E2 . **No**

Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Did the multi-function switch pass the component test?**	INSTALL a new multi-function switch. REFER to Section 211-05 . TEST the system for normal operation.
E2 CHECK CIRCUITS CRW19 (BU/OG), CRW08 (VT/OG) AND CRW17 (GN/VT) FOR OPENS • Disconnect: Windshield Wiper Motor C125. • Using the following table, measure the resistance between multi-function switch C202 harness side and the windshield wiper motor C125 harness side: **Multi-function Switch C202** / **Windshield Wiper Motor C125** Pin 16, circuit CRW19 (BU/OG) / Pin 10, circuit CRW19 (BU/OG) Pin 9, circuit CRW08 (VT/OG) / Pin 1, circuit CRW08 (VT/OG) Pin 12, circuit CRW17 (GN/VT) / Pin 9, circuit CRW17 (GN/VT)  N0052863 • **Is the resistance less than 5 ohms?**	**Yes** GO to E3 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.
E3 CHECK CIRCUITS CRW19 (BU/OG), CRW08 (VT/OG) OR CRW17 (GN/VT) FOR SHORTS • Using the following table, measure the resistance between windshield wiper motor C125 harness side and ground: **Windshield Wiper Motor C125** / **Ground** Pin 10, circuit CRW19 (BU/OG) / Ground Pin 1, circuit CRW08 (VT/OG) / Ground Pin 9, circuit CRW17 (GN/VT) / Ground	**Yes** GO to E4 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.

 • **Is the resistance greater than 10,000 ohms?**	
E4 CHECK FOR CORRECT WIPER MOTOR OPERATION	

• Disconnect all wiper motor connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all wiper motor connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	GO to E5 .
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

E5 CHECK THE WINDSHIELD WIPER MOTOR	
• Key in OFF position. • Disconnect: Windshield Wiper Motor C125. • Carry out the windshield wiper motor component test as described in this section. • **Did the windshield wiper motor pass the component test?**	**Yes** The system is operating correctly at this time. Concern may have been caused by binding or incorrect pivot arm adjustment. REFER to Wiper Blade and Pivot Arm Adjustment — Windshield in this section. TEST the system for normal operation. **No** INSTALL a new windshield wiper motor. REFER to Wiper Motor — Windshield in this section.

Pinpoint Test F: The Intermittent Wiper Speed Does Not Operate Correctly — Windshield

Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

Normal Operation

During normal operation, the windshield wiper motor receives voltage at all times through smart junction box (SJB) fuse 49 (30A), circuit SBB49 (RD). The windshield wiper motor also receives power with the ignition switch in RUN or ACC positions through SJB fuse 45 (5A), circuit CBP45 (YE). Ground is provided to the windshield wiper motor through circuit GD133 (BK) and circuit GD120 (BK/GN). The run/park and high/low relays are contained in the wiper motor electronics. Mode of operation is dependent on the signal(s) received from the multi-function switch.

Possible Causes

- Multi-function switch
- Open or short to ground in circuit CRW18 (VT/WH), CRW17 (GN/VT) or CRW19 (BU/OG)
- Windshield wiper motor

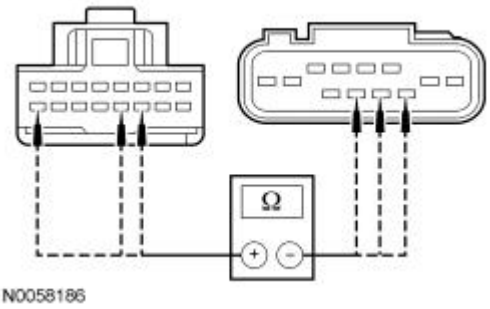
PINPOINT TEST F: THE INTERMITTENT WIPER SPEED DOES NOT OPERATE CORRECTLY — WINDSHIELD

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>F1 CHECK THE MULTI-FUNCTION SWITCH
• Key in OFF position.
• Disconnect: Multi-function Switch C202.
• Carry out the multi-function switch component test.

Refer to Wiring Diagrams Cell 149 for schematic and connector information.

• Did the multi-function switch pass the component test?</td><td>Yes
GO to F2 .

No
INSTALL a new multi-function switch. REFER to Section 211-05 . TEST the system for normal operation.</td></tr>
<tr><td>F2 CHECK CIRCUITS CRW19 (BU/OG), CRW18 (VT/WH) AND CRW17 (GN/VT) FOR OPENS
• Disconnect: Windshield Wiper Motor C125.
• Using the following table, measure the resistance between multi-function switch C202 harness side and windshield wiper motor C125 harness side:

<table><tr><th>Multi-function Switch C202a</th><th>Windshield Wiper Motor C125</th></tr><tr><td>Pin 16, circuit CRW19 (BU/OG)</td><td>Pin 10, circuit CRW19 (BU/OG)</td></tr><tr><td>Pin 12, circuit CRW17 (GN/VT)</td><td>Pin 9, circuit CRW17 (GN/VT)</td></tr><tr><td>Pin 11, circuit CRW18 (VT/WH)</td><td>Pin 11, circuit CRW18 (VT/WH)</td></tr></table>
 


• Is the resistance less than 5 ohms?</td><td>Yes
GO to F3 .

No
REPAIR the circuit(s) in question. TEST the system for normal operation.</td></tr>
<tr><td>F3 CHECK CIRCUITS CRW19 (BU/OG), CRW18 (VT/WH) OR CRW17 (GN/VT) FOR SHORTS

REPAIR the circuit(s) in question. TEST the system for normal operation.</td></tr>
</table>

 N0058187 • **Is the resistance greater than 10,000 ohms?**	
F4 CHECK FOR CORRECT WIPER MOTOR OPERATION	

• Disconnect all wiper motor connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all wiper motor connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	GO to F5 .
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

F5 CHECK THE WINDSHIELD WIPER MOTOR	
• Key in OFF position. • Disconnect: Windshield Wiper Motor C125. • Carry out the windshield wiper motor component test as described in this section. • **Did the windshield wiper motor pass the component test?**	**Yes** The system is operating correctly at this time. Concern may have been caused by binding or incorrect pivot arm adjustment. REFER to Wiper Blade and Pivot Arm Adjustment — Windshield in this section. TEST the system for normal operation. **No** INSTALL a new windshield wiper motor. REFER to Wiper Motor — Windshield in this section.

Pinpoint Test G: The Intermittent Wiper Speed Does Not Operate Correctly — Rear Window

Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

Normal Operation

During normal operation, the rear wiper motor receives voltage at all times through smart junction box (SJB) fuse 19 (25A), circuit SBP19 (BU/RD). The windshield wiper motor also receives power with the ignition switch in RUN or ACC positions through SJB fuse 43 (5A), circuit CBP43 (GY). Ground is provided to the windshield wiper motor through circuit GD150 (BK/WH). The run/park relay is contained in the rear wiper motor electronics. Mode of operation is dependent on the signal(s) received from the multi-function switch.

Possible Causes

- Multi-function switch
- Rear window wiper motor

PINPOINT TEST G: THE INTERMITTENT WIPER SPEED DOES NOT OPERATE CORRECTLY — REAR WINDOW

Test Step	Result / Action to Take
G1 VERIFY REAR WASHER PUMP OPERATION • Key in ON position. • Activate the rear washer pump. • **Does the rear washer pump activate?**	**Yes** GO to G2 . **No** Go To Pinpoint Test I .
G2 CHECK THE MULTI-FUNCTION SWITCH • Key in OFF position. • Disconnect: Multi-function Switch C202. • Carry out the multi-function switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Did the multi-function switch pass the component test?**	**Yes** GO to G3 . **No** INSTALL a new multi-function switch. REFER to Section 211-05 .

G3 CHECK FOR CORRECT WIPER MOTOR OPERATION
• Disconnect all wiper motor connectors.
• Check for:
  ▪ liftgate glass open.
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all wiper motor connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	GO to G4 .
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

G4 CHECK THE REAR WINDOW WIPER MOTOR • Carry out the rear widow wiper motor component test as described in this section. • **Did the rear window wiper motor pass the component test?**	**Yes** The system is operating correctly at this time. Concern may have been caused by binding or incorrect pivot arm adjustment. REFER to Wiper Blade and Pivot Arm Adjustment — Rear in this section. TEST the system for normal operation. **No** INSTALL a new rear window wiper motor. REFER to Wiper Motor — Rear Window in this section.

Pinpoint Test H: The Wash and Wipe Function is Inoperative — Rear Window

Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

Normal Operation

During normal operation, the rear wiper motor receives voltage at all times through smart junction box (SJB) fuse 19 (25A), circuit SBP19 (BU/RD). The windshield wiper motor also receives power with the ignition switch in RUN or ACC positions through SJB fuse 43 (5A), circuit CBP43 (GY). Ground is provided to the windshield wiper motor through circuit GD150 (BK/WH). The run/park relay is contained in the rear wiper motor electronics. Mode of operation is dependent on the signal(s) received from the multi-function switch. When the correct input is received from the multi-function switch, the rear wiper motor provides power to the washer pump through circuit CRW12 (GY/OG). Ground is provided to the washer pump through circuit CRW14 (BU/WH) and the windshield wiper motor.

Possible Causes

- Multi-function switch
- Open in circuit
- Rear window wiper motor

PINPOINT TEST H: THE WASH AND WIPE FUNCTION IS INOPERATIVE — REAR WINDOW

Test Step	Result / Action to Take
H1 CHECK THE WASHER PUMP • Operate the rear window washer system. • **Does the washer pump operate?**	**Yes** GO to H2 . **No** Go To Pinpoint Test I
H2 CHECK THE MULTI-FUNCTION SWITCH • Key in OFF position. • Disconnect: Multi-function Switch C202. • Carry out the multi-function switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Did the multi-function switch pass the component test?**	**Yes** GO to H3 . **No** INSTALL a new multi-function switch. REFER to Section 211-05 .

H3 CHECK FOR CORRECT WIPER MOTOR OPERATION
• Disconnect all wiper motor connectors.
• Check for:
  ▪ liftgate glass open.
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all wiper motor connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	GO to H4 .
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

H4 CHECK THE REAR WINDOW	

WIPER MOTOR	
• Carry out the rear widow wiper motor component test as described in this section. • **Did the rear window wiper motor pass the component test?**	**Yes** The system is operating correctly at this time. Concern may have been caused by binding or incorrect pivot arm adjustment. REFER to Wiper Blade and Pivot Arm Adjustment — Rear in this section. TEST the system for normal operation. **No** INSTALL a new rear window wiper motor. REFER to Wiper Motor — Rear Window in this section.

Pinpoint Test I: The Washer Pump is Inoperative

Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

Normal Operation

During normal operation, when the front wiper wash is selected, the windshield wiper motor provides power to the washer pump through circuit CRW14 (BU/WH) and ground is provided to the washer pump through circuit CRW12 (GY/OG) and the rear wiper motor. If rear wiper wash is selected, the rear wiper motor provides power to the washer pump through circuit CRW12 (GY/OG) and ground is provided to the washer pump through circuit CRW14 (BU/WH) and the windshield wiper motor.

Possible Causes

- Multi-function switch
- Open in circuit CRW14 (BU/WH), CRW12 (GY/OG), CRW07 (GY/BN), CRW20 (GY/YE), SBB49 (RD) or GD149 (BK/GY)
- Short to ground in circuit CRW14 (BU/WH), CRW12 (GY/OG), CRW07 (GY/BN) or CRW20 (GY/YE)
- Washer pump
- Windshield wiper motor
- Rear wiper motor

PINPOINT TEST I: THE WASHER PUMP IS INOPERATIVE

Test Step	Result / Action to Take
I1 CHECK CIRCUIT CRW14 (BU/WH) FOR GROUND	
• Disconnect: Washer Pump Motor C1357. • Key in ON position. • Measure the resistance between washer pump C1357-2, circuit CRW14 (BU/WH) harness side and ground.  	**Yes** GO to I3 . **No** GO to I2 .

• **Is the resistance less than 5 ohms?**	
I2 CHECK CIRCUIT CRW14 (BU/WH) FOR AN OPEN	
• Key in OFF position. • Disconnect: Windshield Wiper Motor C125. • Measure the resistance between windshield wiper motor C125-7, circuit CRW14 (BU/WH), harness side and washer pump C1357-2, circuit CRW14 (BU/WH) harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to I14 . **No** REPAIR the circuit. TEST the system for normal operation.
I3 CHECK CIRCUIT CRW12 (GY/OG) FOR GROUND	
• Measure the resistance between washer pump C1357-1, circuit CRW12 (GY/OG) harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** GO to I6 . **No** GO to I4 .
I4 CHECK CIRCUIT CRW12 (GY/OG) FOR AN OPEN	
• Key in OFF position. • Disconnect: Rear Window Wiper Motor C476. • Measure the resistance between rear window wiper motor C476-5, circuit CRW12 (GY/OG), harness side and washer pump C1357-1, circuit CRW12 (GY/OG) harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to I5 . **No** REPAIR the circuit. TEST the system for normal operation.
I5 CHECK CIRCUIT GD149 (BK/GY) FOR AN OPEN	
• Measure the resistance between rear window wiper motor C476-2, circuit GD149 (BK/GY), harness side and ground.	**Yes** GO to I15 . **No**

 N0059043 • **Is the resistance less than 5 ohms?**	REPAIR the circuit. TEST the system for normal operation.
I6 CHECK CIRCUIT CRW14 (BU/WH) FOR VOLTAGE	
• Key in ON position. • Measure the voltage between washer pump C1357-2, circuit CRW14 (BU/WH) harness side and ground while depressing the multi-function switch to the WASH position.  A0045231 • **Is the voltage greater than 10 volts?**	**Yes** GO to I10 . **No** GO to I7 .
I7 CHECK CIRCUIT CRW14 (BU/WH) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: Windshield Wiper Motor C125. • Measure the resistance between washer pump C1357-2, circuit CRW14 (BU/WH) harness side and ground.  A0037625 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to I8 . **No** REPAIR the circuit. TEST the system for normal operation.
I8 CHECK THE MULTI-FUNCTION SWITCH	
• Disconnect: Multi-function Switch C202. • Carry out the multi-function switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Did the multi-function switch pass the component test?**	**Yes** GO to I9 . **No** INSTALL a new multi-function switch. REFER to Section 211-05 . TEST the system for normal operation.

I9 CHECK CIRCUIT CRW07 (GY/BN) FOR AN OPEN OR SHORT TO GROUND	
• Measure the resistance between windshield wiper motor C125-12, circuit CRW07 (GY/BN) harness side and multi-function switch C202-10, circuit CRW07 (GY/BN) harness side; and between multi-function switch C202-10, circuit CRW07 (GY/BN) harness side and ground.  N0059045 • **Is the resistance less than 5 ohms between multi-function switch and wiper motor; and greater than 10,000 ohms between multi-function switch and ground?**	**Yes** GO to I14 . **No** REPAIR the circuit. TEST the system for normal operation.
I10 CHECK CIRCUIT CRW12 (GY/OG) FOR VOLTAGE	
• Measure the voltage between washer pump C1357-1, circuit CRW12 (GY/OG) harness side and ground while depressing the multi-function switch to the REAR WASH position.  N0059046 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new washer pump. TEST the system for normal operation. **No** GO to I11 .
I11 CHECK CIRCUIT CRW12 (GY/OG) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: Rear Window Wiper Motor C476. • Measure the resistance between washer pump C1357-1, circuit CRW12 (GY/OG) harness side and ground.  A0045230 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to I12 . **No** REPAIR the circuit. TEST the system for normal operation.
I12 CHECK THE MULTI-FUNCTION SWITCH	
• Disconnect: Multi-function Switch C202. • Carry out the multi-function switch component test.	**Yes** GO to I13 .

Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Did the multi-function switch pass the component test?**	**No** INSTALL a new multi-function switch. REFER to Section 211-05 . TEST the system for normal operation.
I13 CHECK CIRCUIT CRW20 (GY/YE) FOR AN OPEN OR SHORT TO GROUND	
• Measure the resistance between rear window wiper motor C476-6, circuit CRW20 (GY/YE) harness side and multi-function switch C202-14, circuit CRW20 (GY/YE) harness side; and between multi-function switch C202-14, circuit CRW20 (GY/YE) harness side and ground.  • **Is the resistance less than 5 ohms between multi-function switch and wiper motor; and greater than 10,000 ohms between multi-function switch and ground?**	**Yes** GO to I15 . **No** REPAIR the circuit. TEST the system for normal operation.
I14 CHECK THE WINDSHIELD WIPER MOTOR	

• Disconnect the wiper motor connectors.
• Check for:
  ▪ liftgate glass open.
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all wiper motor connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new windshield wiper motor. REFER to Wiper Motor — Windshield in this section. TEST the system for normal operation.
	
	No
	REPAIR the circuit. TEST the system for normal operation.

I15 CHECK THE REAR WINDOW WIPER MOTOR	

• Disconnect the wiper motor connectors.
• Check for:
  ▪ liftgate glass open.
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all wiper motor connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new rear window wiper motor. REFER to Wiper Motor — Rear Window in this section. TEST the system for normal operation.
	
	No
	REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test J: The Speed Dependent Interval Mode Does Not Operate Correctly

Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

Normal Operation

During normal operation, the windshield wiper motor receives vehicle speed information from the PCM system through circuit VE822 (YE/BU). The speed dependent wipers function in all INT modes except INT 1.

Possible Causes

- Open or short to ground in circuit VE822 (YE/BU)
- Windshield wiper motor
- Powertrain control module (PCM)

PINPOINT TEST J: THE WINDSHIELD WIPER SPEED DEPENDENT INTERVAL MODE DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
J1 CHECK THE PCM — MONITOR THE VSS • Monitor the VSS while driving the vehicle from 0 to 88.5 kph (55 mph). • **Does the VSS agree with the PCM PIDs?**	**Yes** GO to J2 . **No** REFER to Section 206-09 .
J2 CHECK CIRCUIT VE822 (YE/BU) FOR AN OPEN • Disconnect: PCM C175b. • Disconnect: Windshield Wiper Motor C125. • Measure the resistance between PCM C175b-63, circuit VE822 (YE/BU), harness side and windshield wiper motor C125-4, circuit VE822 (YE/BU), harness side.  N0032269 • **Is the resistance less than 5 ohms?**	**Yes** GO to J3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
J3 CHECK CIRCUIT VE822 (YE/BU) FOR A SHORT TO GROUND • Measure the resistance between PCM C175b-63, circuit VE822 (YE/BU), harness side and ground.	**Yes** GO to J4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 N0032268 • **Is the resistance greater than 10,000 ohms?**	

J4 CHECK FOR CORRECT WIPER MOTOR OPERATION
• Disconnect all wiper motor connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all wiper motor connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	GO to J5 .
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

J5 CHECK THE WINDSHIELD WIPER MOTOR • Key in OFF position. • Disconnect: Windshield Wiper Motor C125. • Carry out the windshield wiper motor component test as described in this section. • **Did the windshield wiper motor pass the component test?**	**Yes** The system is operating correctly at this time. Concern may have been caused by binding or incorrect pivot arm adjustment. REFER to Wiper Blade and Pivot Arm Adjustment — Windshield in this section. TEST the system for normal operation. **No** INSTALL a new windshield wiper motor. REFER to Wiper Motor — Windshield in this section.

Component Test — Wiper Motor — Windshield

CAUTION: Do not handle the windshield wiper motor abusively when diagnosing the wiper operations. Failure to follow this caution may result in damage to the motor magnets and will make the windshield wiper motor inoperative. Rough handling of new windshield wiper motors may also damage the motor magnets.

NOTE: Windshield wiper motor component test is carried out to determine if windshield wiper motor and module are functional and not in default mode. Refer to Principles of Operation in this section.

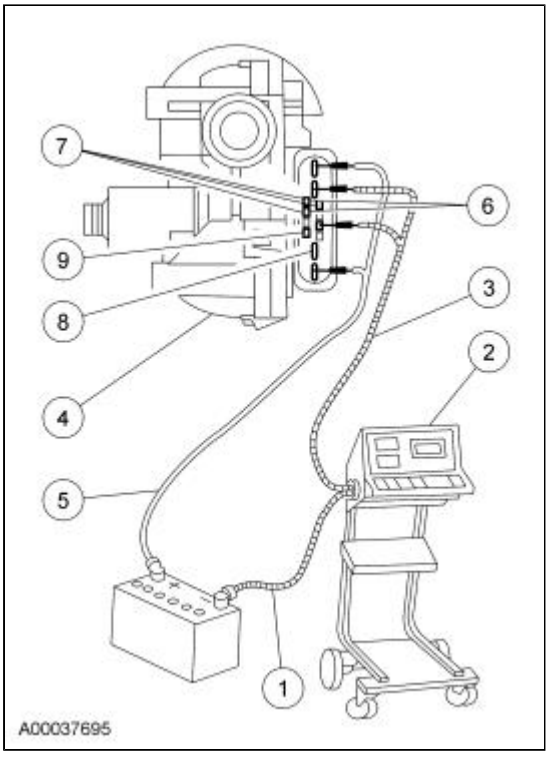
NOTE: Battery voltage must remain within 10 to 15 VDC to carry out test and keep windshield wiper motor from entering its software safe mode.

NOTE: When connecting the power and ground test leads to the windshield wiper motor terminals, care must be taken to not short terminals between power and ground, as well as making sure the logic ground, pin 3, is always securely connected to prevent permanent windshield wiper motor module damage.

If the windshield wiper motor does not pass any of the following tests, install a new windshield wiper

motor. Refer to Wiper Motor — Windshield in this section.

Use SABRE Premium Battery and Electrical System Tester 010-00736 or equivalent to test the windshield wiper motor.



To test the windshield wiper motor, remove the windshield wiper mounting arm and pivot shaft from the windshield wiper motor. Refer to Wiper Blade and Pivot Arm Adjustment — Windshield in this section.

Disconnect the wiper motor. Connect the (1) green lead from the (2) SABRE to the battery negative (-) post. Connect the red lead (3) from the SABRE to the wiper motor (4) component side connector ground and logic ground pins 6 and 3 (3). Connect battery positive cable (5) to windshield wiper motor (4) component side connector battery and logic positive pins 5 and 8 (5).

Low Speed

Test the LOW speed mode by connecting a separate set of test leads from battery ground (-) post to windshield wiper motor (4) component side pins 9 and 10 (6). When these pins are grounded, the windshield wiper motor operation should now be in low speed mode.

High Speed

Test the HIGH speed mode by connecting a separate set of test leads from battery ground (-) post to windshield wiper motor (4) component side pins 1, 9 and 10 (7). When these pins are grounded, the windshield wiper motor operation should now be in high speed mode.

Washer Pump Relay (Integral)

Test the windshield wiper motor internal washer relay function by measuring the voltage between windshield wiper motor (4) component side pin 7 (8) and ground while grounding the windshield wiper motor (4) component side pin 12 (9). When wash command input pin 12 is grounded, measured voltage should read 10 volts or greater.

Component Test — Wiper Motor — Rear Window

CAUTION: Do not handle the rear window wiper motor abusively when diagnosing the wiper operations. Failure to follow this caution may result in damage to the motor magnets and will make the rear window wiper motor inoperative. Rough handling of new rear window wiper motors may also damage the motor magnets.

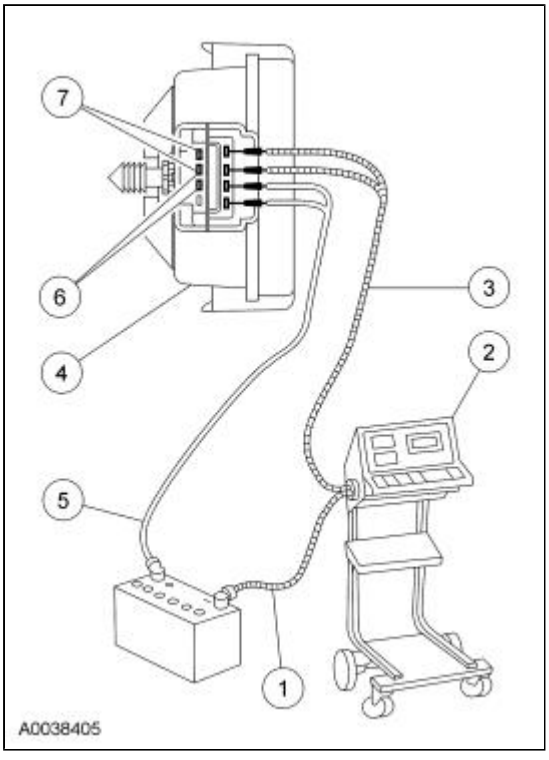
NOTE: The rear window wiper motor component test is carried out to determine if wiper motor and module are functional.

NOTE: Battery voltage must remain within 10 to 15 VDC to carry out test and keep wiper motor from entering its software safe mode.

NOTE: When connecting the power and ground test leads to the rear wiper motor terminals, care must be taken to not short terminals between power and ground, as well as making sure the logic ground, pin 3, is always securely connected to prevent permanent rear window wiper motor module damage.

If the rear window wiper motor does not pass any of the following tests, install a new rear window wiper motor. Refer to Wiper Motor — Rear Window in this section.

Use the SABRE Premium Battery and Electrical System Tester 010-00736 or equivalent to test the rear window wiper motor.



Disconnect the rear window wiper motor. Connect the (1) green lead from the (2) SABRE to the battery negative (-) post. Connect the red lead (3) from the SABRE to the wiper motor (4) component side connector ground pins 1 an 2 (3). Connect battery positive cable (5) to wiper motor (4) component side connector battery and logic positive pins 3 and 4 (5).

On Mode

Test the ON mode by connecting a separate set of test leads from battery ground (-) post to windshield wiper motor (4) component side pins 6 and 7 (6). When these pins are grounded, the rear window wiper motor operation should now be in ON mode.

Washer Pump Relay (Integral)

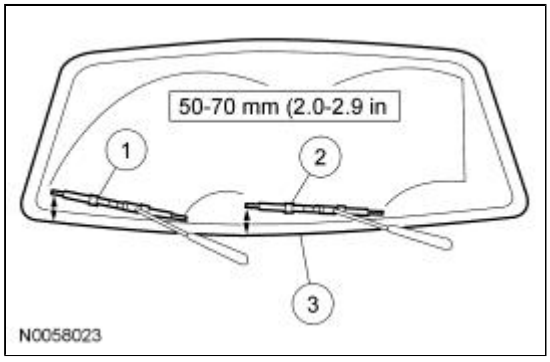
Test the rear window wiper motor internal washer relay function by measuring the voltage between wiper motor (4) component side pin 5 (7) and ground. When wash command input pin 6 (7) is grounded, measured voltage should read 10 volts or greater.

Wiper Blade and Pivot Arm Adjustment — Windshield

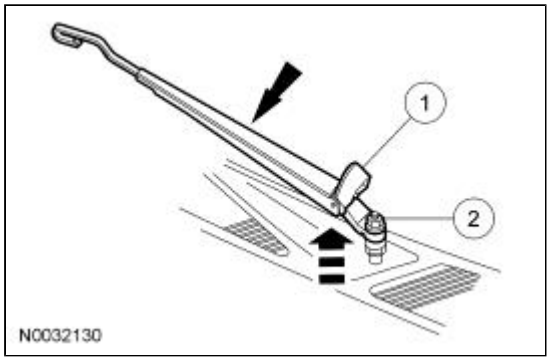
Printable View (105 KB)

1. Cycle and park the windshield wipers.

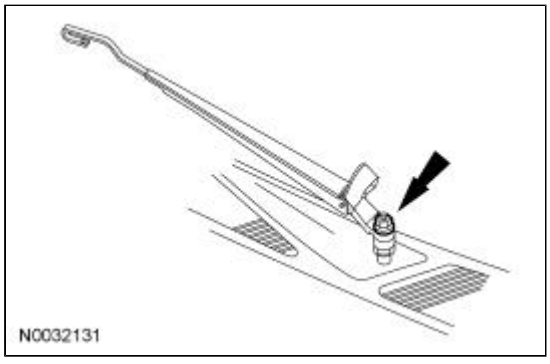
2. Verify the distance between the outer tip of the (1) RH windshield wiper blade and the (3) bottom of the windshield glass and between the outer tip of the (2) LH windshield wiper blade and the (3) bottom of the windshield glass are within specifications.



3. If the distance is not within specification, remove the windshield wiper pivot arm and reposition to specification.
    1. Lift the pivot arm nut cover.
    2. Remove the nut.



4. Tighten the windshield wiper pivot arm nuts to 35 Nm (26 lb-ft).

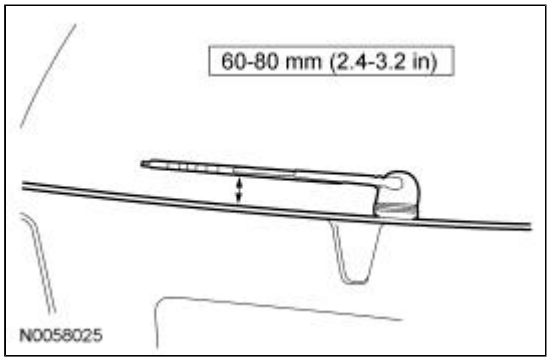


Wiper Blade and Pivot Arm Adjustment — Rear

Printable View (112 KB)

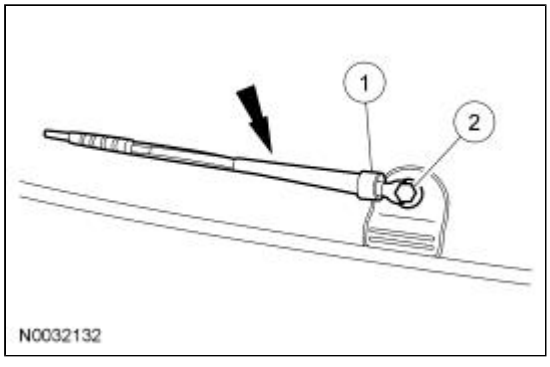
1. Cycle and park the rear window wiper pivot arm and blade.

2. Check the rear window wiper park measurement. If not within specification, the rear window wiper pivot arm will need to be removed.



3. **CAUTION: Use a shop towel or similar device to protect the vehicle finish when carrying out the procedure.**

   Remove the rear window wiper pivot arm.
   1. Lift the pivot arm nut cover.
   2. Remove the nut.



4. **NOTE:** This step makes sure that the wiper motor is in the PARK position.

   Turn the rear window wiper switch ON and allow the motor to operate for at least one cycle. Turn the rear window wiper switch to OFF.

5. Install the rear window wiper pivot arm onto the rear window wiper motor shaft.
   1. Position the wiper pivot arm within specification.
   2. Tighten the nut to 35 Nm (26 lb-ft).
   3. Install the cover.

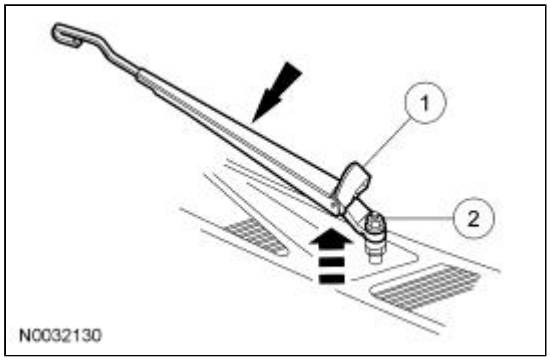
Wiper Pivot Arm — Front

Printable View (94 KB)

Removal and Installation

NOTE: The windshield wiper pivot arms must be in the highest position to remove them.

1. Turn the ignition switch to the ON position.
2. Turn the windshield wiper on.
3. Stop the windshield wiper pivot arms at the highest position by turning the ignition switch OFF.
4. Remove the windshield wiper pivot arm.
    1. Lift the pivot arm nut cover.
    2. Remove the nut.
        - To install, tighten to 35 Nm (26 lb-ft).



5. To install, reverse the removal procedure.
    - Adjust the windshield wiper pivot arms. For additional information, refer to Wiper Blade and Pivot Arm Adjustment — Windshield in this section.

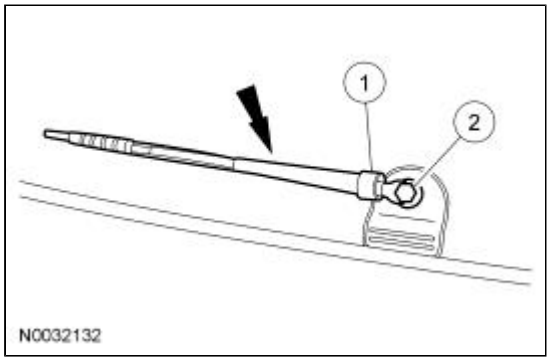
Wiper Pivot Arm — Rear

Printable View (103 KB)

Removal

1. **CAUTION: Use a shop towel or similar device to protect the vehicle finish when carrying out the procedure.**

   Remove the rear window wiper pivot arm.
   1. Lift the pivot arm nut cover.
   2. Remove the nut.

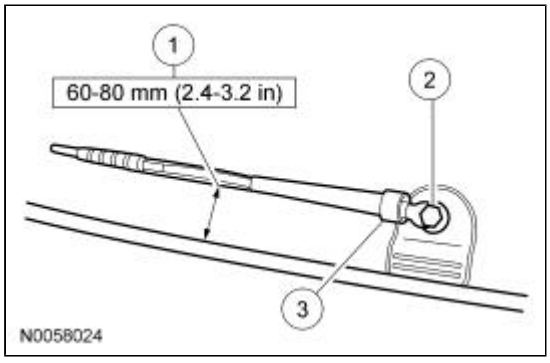


Installation

1. **NOTE:** This step makes sure that the wiper motor is in the PARK position.

   Turn the rear window wiper switch ON and allow the motor to operate for at least one cycle. Turn the rear window wiper switch to OFF.

2. Install the rear window wiper pivot arm onto the rear window wiper motor shaft.
   1. Position the wiper pivot arm within specification.
   2. Tighten the nut to 15 Nm (11 lb-ft).
   3. Install the cover.

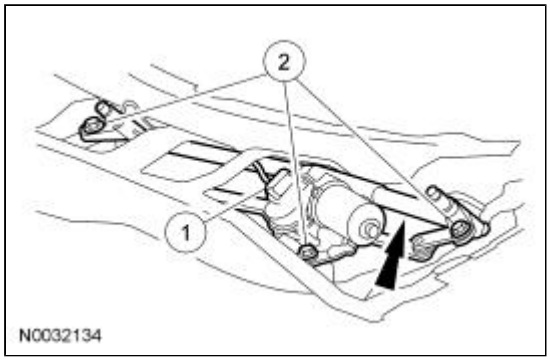


Wiper Mounting Arm and Pivot Shaft — Windshield

Printable View (84 KB)

Removal and Installation

1. Remove the cowl grille panel. For additional information, refer to Section 501-02 .
2. Disconnect and position the hood light harness aside.
3. Remove the hood struts.
   - Using a suitable tool support the hood.
4. Remove the mounting arm and pivot shaft assembly.
   1. Disconnect the electrical connector and position the wiring harness aside.
   2. Remove the bolts.
   - To install, tighten to 8 Nm (71 lb-in).



5. To install, reverse the removal procedure.

Wiper Mounting Arm and Pivot Shaft — Rear

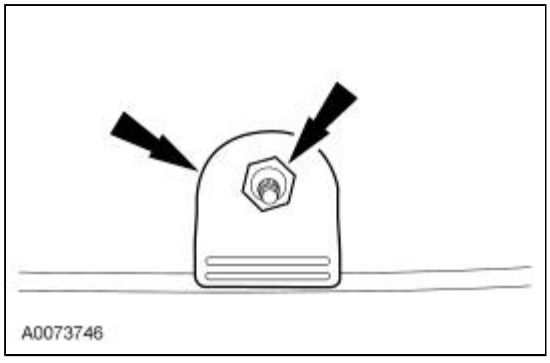
Printable View (82 KB)

Removal and Installation

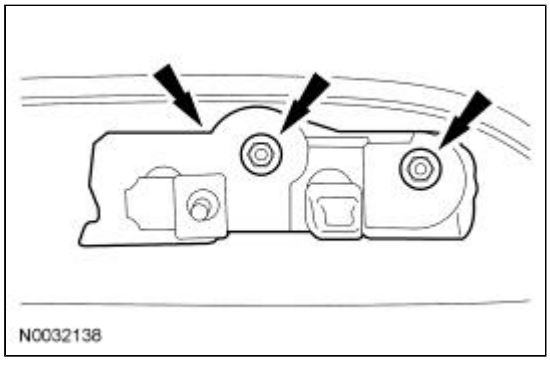
1. Remove the rear wiper pivot arm. For additional information, refer to Wiper Pivot Arm — Rear in this section.

2. Remove the dust boot cover.

3. Remove the nut and the rear window glass handle.
   - To install, tighten to 18 Nm (13 lb-ft).



4. Remove the nuts and the rear window wiper striker and wiper pivot shaft assembly.
   - To install, tighten to 6 Nm (53 lb-in).



5. To install reverse the removal procedure.

Striker and Wiper Pivot Shaft Assembly — Rear

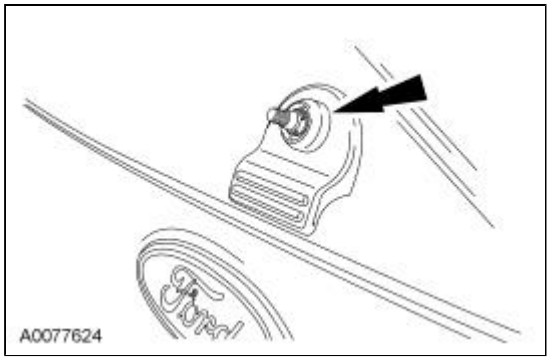
Printable View (271 KB)

Material

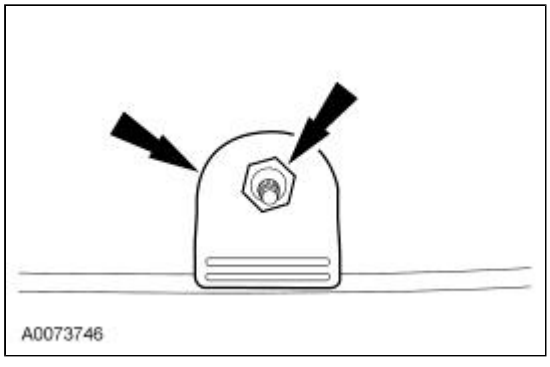
Item	Specification
Rear Window Wiper Motor Alignment Tool	2L1Z-14A163-AB

Removal

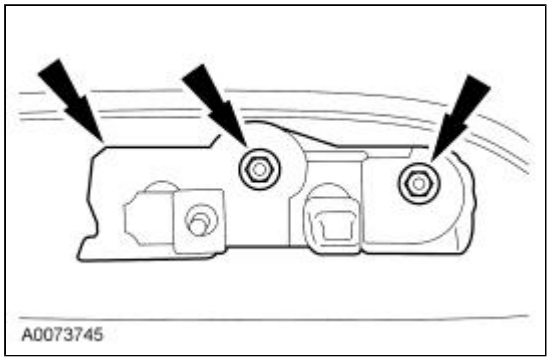
1. Remove the rear wiper pivot arm. For additional information, refer to Wiper Pivot Arm — Rear in this section.
2. Remove the dust boot cover.



3. Remove the nut and the rear window glass handle.



4. Remove the nuts and the rear window striker and wiper pivot shaft assembly.

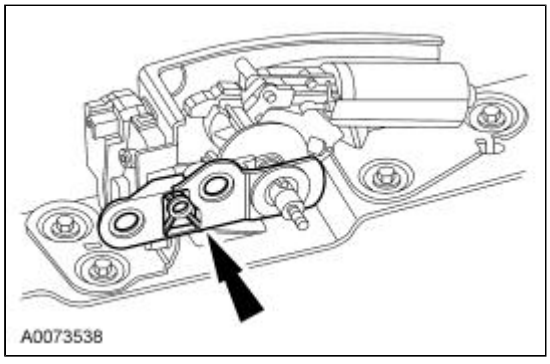


Installation

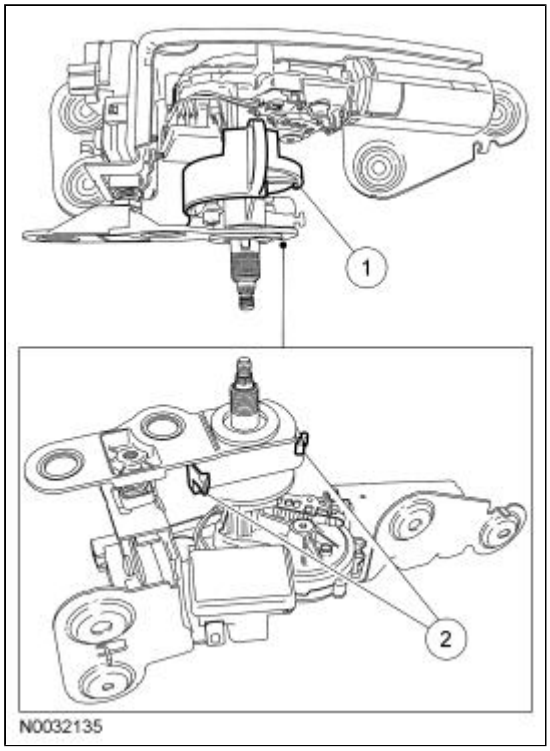
1. Remove the liftgate trim panel. For additional information, refer to Section 501-05 .

2. **NOTE:** An audible click should be heard as the striker engages the latch.

   Push the rear window wiper striker and pivot shaft assembly into the wiper motor. The pivot shaft pin should be aligned with the hole in the motor disc.

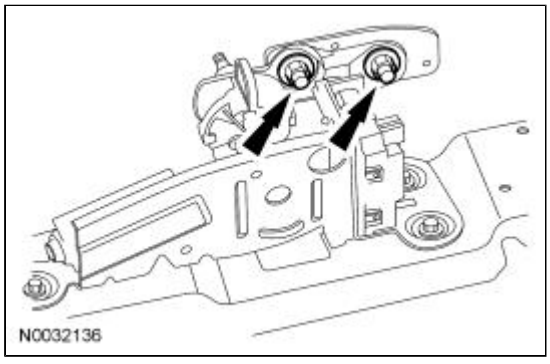


3. Install the rear window wiper motor alignment tool. If installing a new rear wiper motor, one is provided with the motor assembly.
   1. Make sure the alignment tool fits over the motor disc and striker assembly.
   2. Make sure the alignment tool clips are securely engaged.

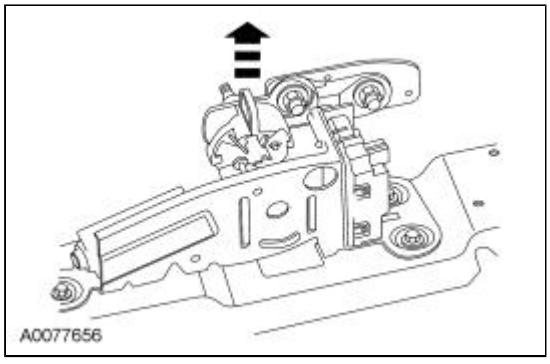


4. Carefully close the liftgate glass.

5. Open the liftgate. Install the rear window wiper striker and wiper pivot arm mounting assembly nuts. Tighten to 6 Nm (53 lb-in).

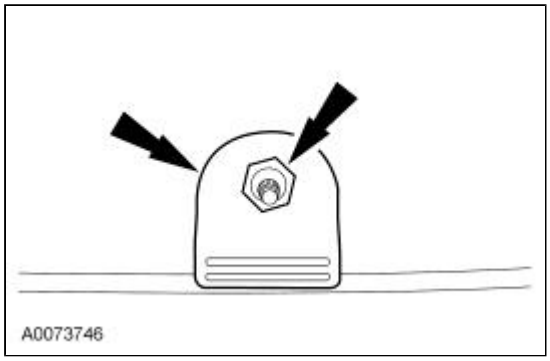


6. Remove the rear window wiper motor alignment tool.

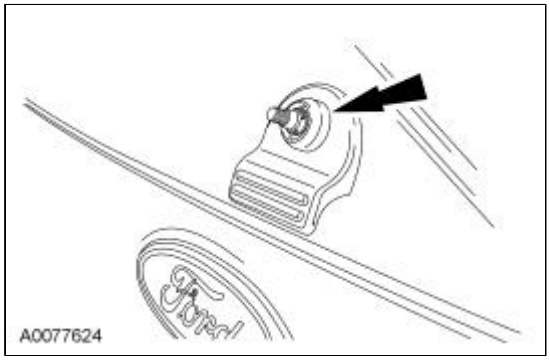


7. Close the liftgate.

8. Install the rear window wiper pivot shaft nut and handle. Tighten to 18 Nm (13 lb-ft).



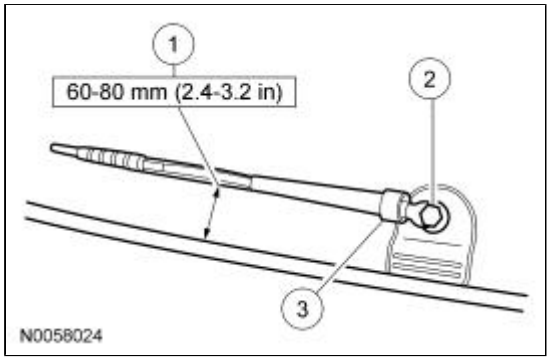
9. Install the dust boot cover.



10. **NOTE:** This step makes sure that the wiper motor is in the PARK position.

    Turn the rear window wiper switch ON and allow the motor to operate for at least one cycle. Turn the rear window wiper switch to OFF.

11. Install the rear wiper pivot arm onto the rear window wiper motor shaft.
    1. Position the wiper pivot arm onto the rear window wiper motor shaft.
    2. Tighten the nut to 15 Nm (11 lb-ft).
    3. Install the cover.



12. Open the liftgate.

13. Install the liftgate trim panel. For additional information, refer to Section 501-05 .

14. Test the liftgate and liftgate glass for normal operation.

Wiper Motor — Windshield

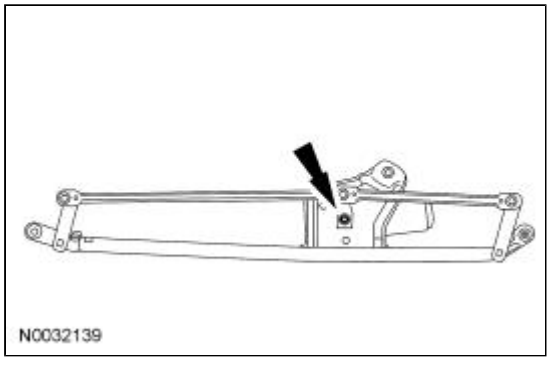
Printable View (96 KB)

Removal and Installation

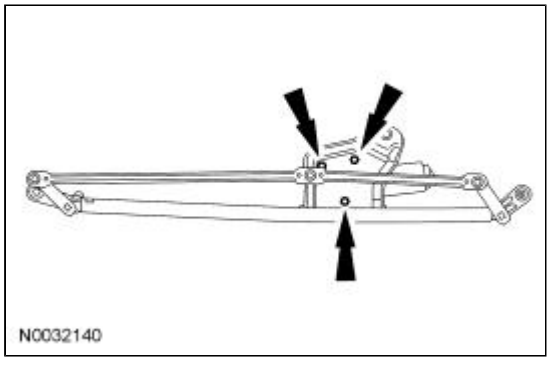
1. Remove the mounting arm and pivot shaft. For additional information, refer to Wiper Mounting Arm and Pivot Shaft — Windshield in this section.

2. **NOTE:** Mark the position of the windshield wiper motor crank before it is disconnected.

   Disconnect the windshield wiper motor crank.
   - Remove the bolt.
   - To install, tighten to 18 Nm (13 lb-ft).



3. Remove the bolts and the windshield wiper motor.
   - To install, tighten to 15 Nm (11 lb-ft).



4. **NOTE:** The windshield wiper motor crank must be set to the same location for the windshield wiper mounting arm and pivot shaft to be installed properly. Refer to Component test in this section.

   To install reverse the removal procedure.

Wiper Motor — Rear Window

Printable View (363 KB)

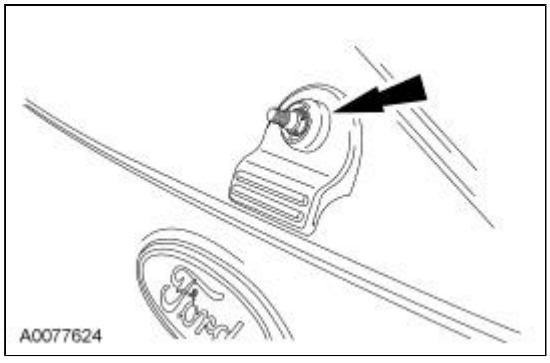
Material

Item	Specification
Rear Window Wiper Motor Alignment Tool	2L1Z-14A163-AB

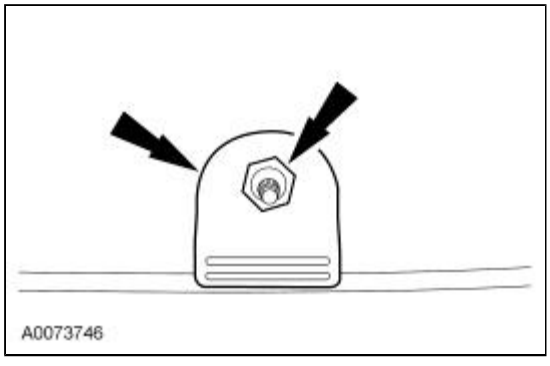
Removal

1. Remove the rear wiper pivot arm. For additional information, refer to Wiper Pivot Arm — Rear in this section.

2. Remove the dust boot cover.

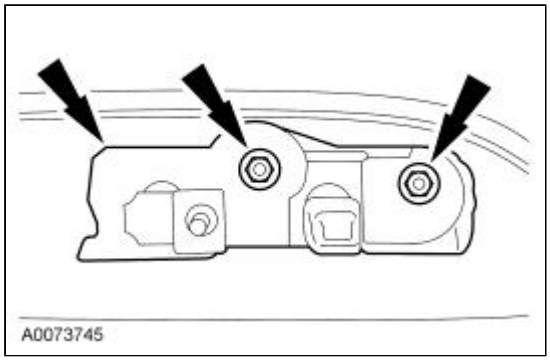


3. Remove the rear window wiper pivot shaft nut and handle.
   - To install, tighten to 18 Nm (13 lb-ft).



4. Open the liftgate glass.

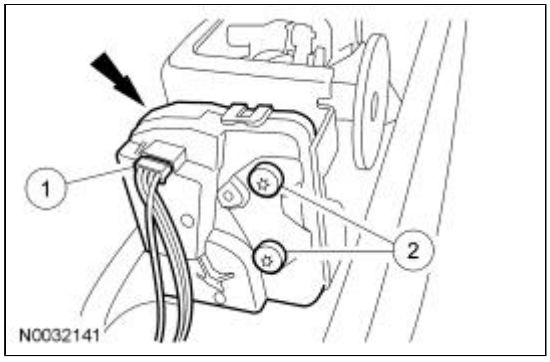
5. Remove the nuts and the rear window striker and wiper pivot shaft assembly.
   - To install, tighten to 6 Nm (53 lb-in).



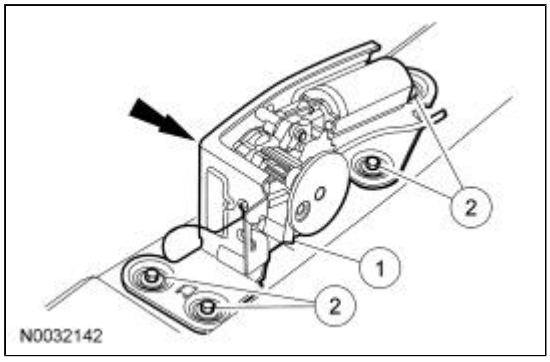
6. Remove the liftgate trim panel. For additional information, refer to Section 501-05 .

7. Close the liftgate.

8. If installing a new rear wiper motor, remove the liftgate window glass latch.
    1. Disconnect the electrical connector.
    2. Remove the bolts.
        - To install, tighten to 8 Nm (71 lb-in).

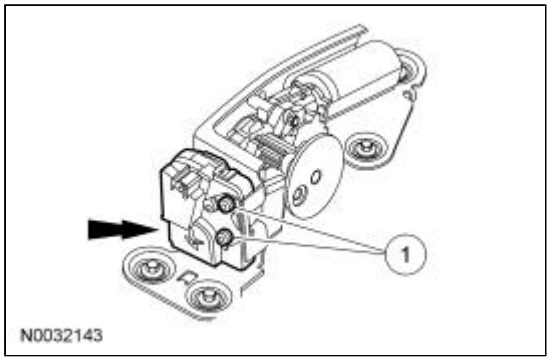


9. Remove the rear window wiper motor.
    1. Disconnect the electrical connector.
    2. Remove the bolts.
        - To install, tighten to 11 Nm (8 lb-ft).



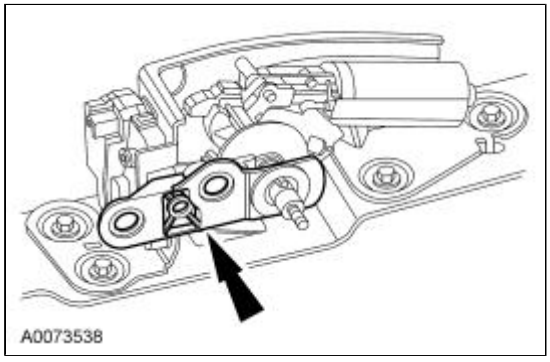
Installation

1. If installing a new rear wiper motor, install the liftgate window glass latch.
    1. Tighten bolts to 8 Nm (71 lb-in).

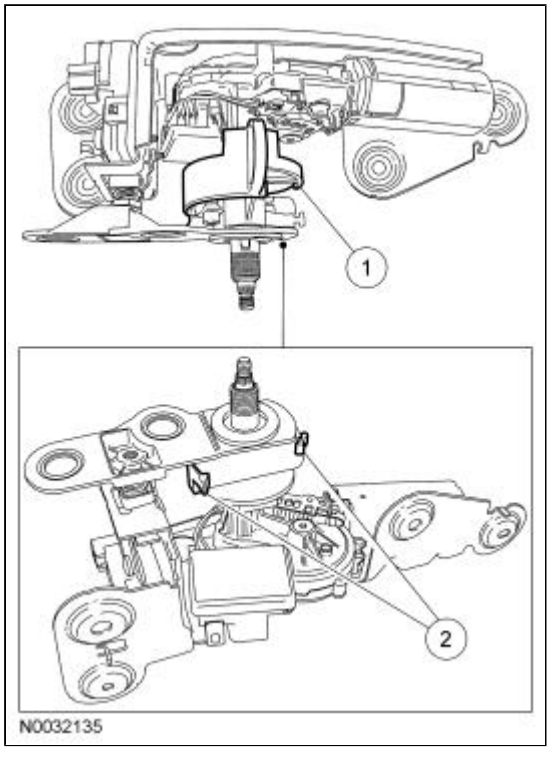


2. **NOTE:** An audible click should be heard as the striker engages the latch.

   Push the rear window wiper striker and pivot shaft assembly into the wiper motor. The pivot shaft pin should be aligned with the hole in the motor disc.

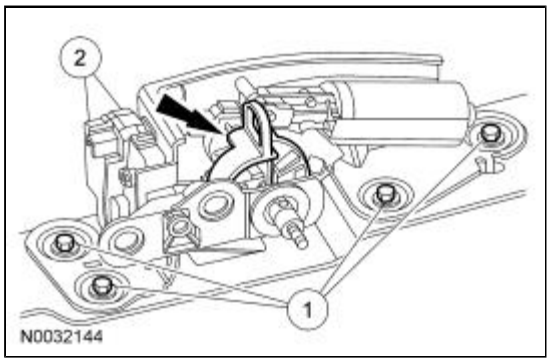


3. Install the rear window wiper motor alignment tool. If installing a new rear wiper motor, one is provided with the motor assembly.
   1. Make sure the alignment tool fits over the motor disc and striker assembly.
   2. Make sure the alignment tool clips are securely engaged.



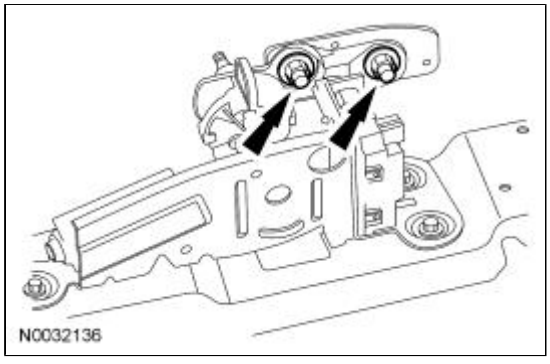
4. Install the rear wiper motor.

1. Tighten the bolts to 11 Nm (8 lb-ft).
2. Connect the electrical connectors.



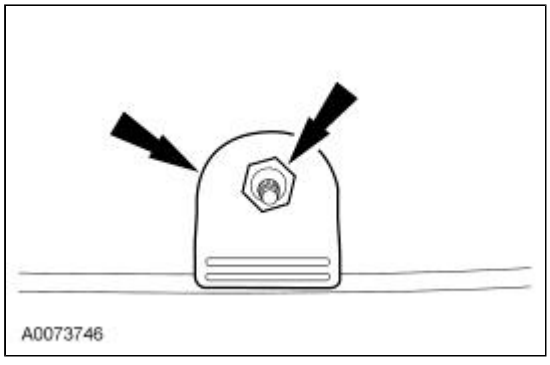
5. Carefully close the liftgate glass.

6. Open the liftgate. Install the rear window wiper striker and wiper pivot arm mounting assembly nuts.
   - Tighten to 6 Nm (53 lb-in).

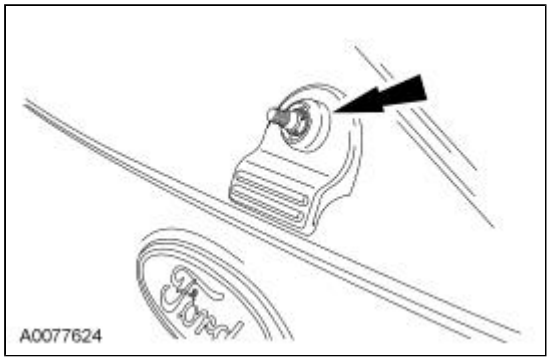


7. Close the liftgate.

8. Install the rear window wiper pivot shaft nut and handle.
   - Tighten to 18 Nm (13 lb-ft).



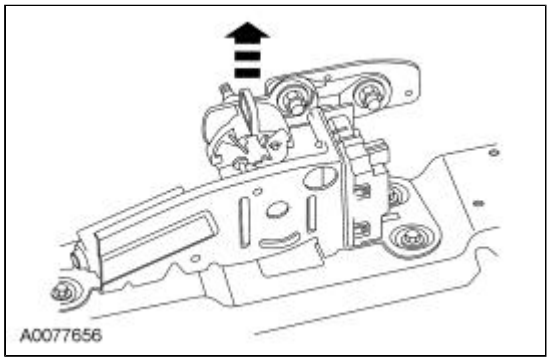
9. Install the dust boot cover.



10. Install the rear wiper pivot arm. For additional information, refer to Wiper Pivot Arm — Rear in this section.

11. Open the liftgate.

12. Remove the rear window wiper motor aligning tool.



13. Open the liftgate glass.

14. Install the liftgate trim panel. Refer to Section 501-05 .

15. Test the liftgate and liftgate glass for normal operation.

Wiper and Washer System — Exploded View, Washer Pump and Reservoir

Washer Pump

Printable View (80 KB)

Removal and Installation

WARNING: Windshield washer solution contains methanol, which is poisonous. Observe all cautions and warnings indicated on the label of the container. Failure to follow these instructions could result in personal injury.

CAUTION: When servicing the windshield washer pump be careful not to damage the windshield washer pump seal.

CAUTION: Do not operate the windshield washer pump before filling the windshield washer reservoir. Failure to do so could result in premature pump failure.

1. Remove the RH headlamp assembly. For additional information, refer to Section 417-01 .
2. Position aside the shield as necessary to gain access to the washer pump.
3. Disconnect the windshield washer reservoir hoses.
4. Disconnect the windshield washer pump electrical connector.
5. Remove the windshield washer pump.
6. To install, reverse the removal procedure.

Washer Reservoir

Printable View (234 KB)

Removal and Installation

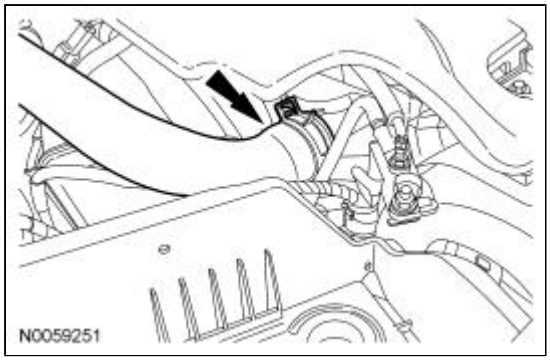
WARNING: Windshield washer solution contains methanol, which is poisonous. Observe all cautions and warnings indicated on the label of the container. Failure to follow these instructions could result in personal injury.

CAUTION: When servicing the windshield washer pump, be careful not to damage the windshield washer pump seal.

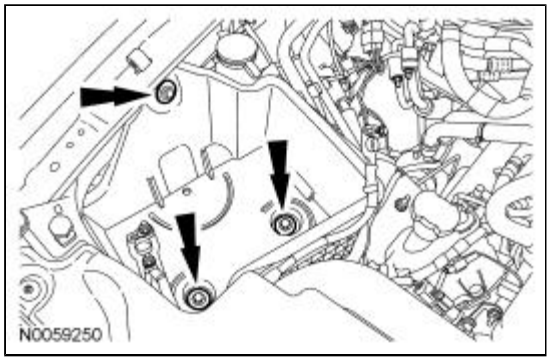
CAUTION: Do not operate the windshield pump before filling the windshield washer reservoir. Failure to do so could result in premature pump failure.

NOTE: The washer reservoir is integrated with the battery tray and cannot be serviced separately.

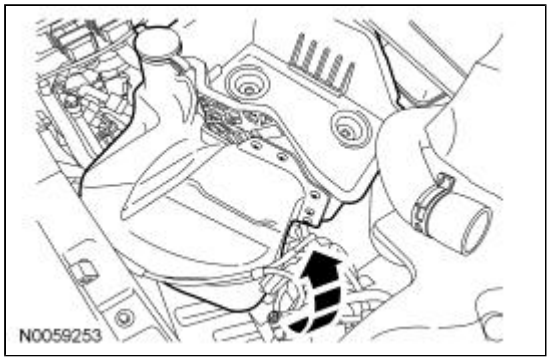
1. Remove the vehicle battery. For additional information, refer to Section 414-01 .
2. Drain the cooling system. For additional information, refer to Section 303-03 .
3. Disconnect the upper radiator hose at the radiator inlet, and position aside.



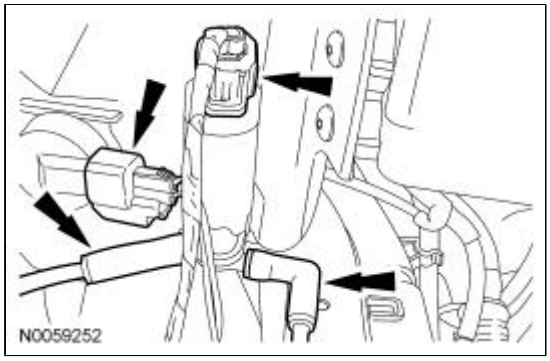
4. Remove the 3 battery tray bolts.
   - To install, tighten to 17 Nm (13 lb-ft).



5. Carefully position the washer reservoir assembly to gain access to the electrical connectors and washer hoses.



6. Disconnect the windshield washer solvent level electrical connector, washer pump electrical connectors and washer hoses.



7. **NOTE:** If necessary, drain the windshield washer reservoir after removal.

   Remove the washer reservoir assembly.

8. Transfer components as necessary.

9. To install, reverse the removal procedure.
   - Refer to Section 303-03 for coolant filling and bleeding procedures.

Roof opening panel glass screws	4	35
Roof opening panel motor screws	4	35
Roof opening panel water trough screws	1	9
Roof opening panel air deflector screws	1	9

Roof Opening Panel

Printable View (63 KB)

The roof opening panel system consists of:

- roof opening panel motor/module.
- roof opening panel.
- overhead console.
- roof opening panel frame.
- roof opening panel frame drain hose.
- roof opening panel water trough.
- roof opening panel shield.
- roof opening panel air deflector.
- roof opening panel lifter assembly.
- roof opening panel rear trough guides.

The roof opening panel assembly uses an integrated motor and module to operate the roof opening panel. The roof opening panel motor and module are installed new as an assembly. The roof opening panel is an electronically operated glass panel that can be opened or closed by the roof opening panel switch. Actuating the switch in either a forward or rearward motion supplies a ground to the roof opening panel motor/module. The soft-stop function is controlled by the roof opening panel motor/module. The roof opening panel has 3 modes of operation, manual mode, express open and tilt. The express open feature is activated when the switch is pressed momentarily. The tilt feature is activated when the tilt switch is depressed. These functions are controlled by the roof opening panel motor/module.

The roof opening panel has a comfort STOP position, which is 70 mm (2.75 in) from the full OPEN position, and is controlled by the roof opening panel motor/module. The comfort STOP position reduces wind rumbling noise that may occur when the vehicle is operated with the roof opening panel in the full OPEN position.

When the roof opening panel is opened in either express open or manual mode, it will stop at the comfort stop position first. In manual mode, the roof opening panel can be opened to full open from comfort stop by releasing the switch, then pressing and holding it until the roof opening panel is in the full OPEN position. In express open mode, the roof opening panel can be opened to full open from comfort stop by momentarily pressing the switch.

The roof opening panel can be closed by pressing the switch and holding it until the roof opening panel is in the desired position.

A new roof opening panel motor will only open and must be initialized. The roof opening panel motor initialization procedure must be done when repairs are carried out on any part of the roof opening panel system, including: any time the roof opening panel motor has been removed from the roof opening panel assembly, a new roof opening panel motor has been installed or when a new roof opening panel assembly has been installed.

ST1137-A	73III Automotive Meter or equivalent 105-R0057

Inspection and Verification

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Roof opening panel • Roof opening panel frame • Roof opening panel drain hoses • Roof opening panel lifter assemblies • Roof opening panel water trough • Roof opening panel rear trough guides • Roof opening panel air deflector assembly • Roof opening panel seal • Roof opening panel shield	• Smart junction box (SJB) circuit breaker 47 (30A) • Circuitry • Accessory delay relay • Roof opening panel switch

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is not visually evident, verify the symptom and refer to Symptom Chart.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The roof opening panel has excessive wind noise	• Roof opening panel adjustment • Roof opening panel seal	• Go To Pinpoint Test A .
• The roof opening panel leaks	• Roof opening panel adjustment	• Go To Pinpoint

	• Roof opening panel seal • Roof opening panel water trough and rear trough guides • Drain tube attachment points • Roof opening panel drain hose • Front rail sealant • Roof opening panel	Test B .
• The roof opening panel rattles	• Roof opening panel • Roof opening panel tracks • Roof opening panel air deflector assembly • Roof opening panel water trough • Roof opening panel rear trough guides • Roof opening panel lifter assemblies • Headliner • Motor pad • Rear side brackets	• Go To Pinpoint Test C .
• The roof opening panel is noisy during operation	• Roof opening panel • Roof opening panel tracks • Roof opening panel lifter assemblies • Roof opening panel adjustment • Roof opening panel motor/module assembly	• Go To Pinpoint Test D .
• The roof opening panel does not open or close	• Roof opening panel adjustment • Circuit breaker • Circuitry • Roof opening panel switch • Roof opening panel motor/module assembly • Roof opening panel water trough • Roof opening panel rear trough guides • Roof opening panel lifter assemblies	• Go To Pinpoint Test E .
• The express open is inoperative	• Circuitry • Roof opening panel switch • Roof opening panel motor assembly	• Go To Pinpoint Test F .
• The roof opening panel will not stop in the vent position	• Circuitry • Roof opening panel switch • Roof opening panel motor assembly	• Go To Pinpoint Test F .
• The roof opening panel does not open or close — one direction only	• Circuitry • Roof opening panel switch • Roof opening panel motor assembly	• Go To Pinpoint Test E .

Pinpoint Tests

Pinpoint Test A: The Roof Opening Panel Has Excessive Wind Noise

Normal Operation

During normal operation, when the roof opening panel glass is completely closed, it is flush with the roof panel and correctly sealed.

Possible Causes

- Roof opening panel glass adjustment
- Roof opening panel glass seal(s)

PINPOINT TEST A: THE ROOF OPENING PANEL HAS EXCESSIVE WIND NOISE

Test Step	Result / Action to Take
A1 VERIFY ROOF OPENING PANEL NOISE	
• Road test the vehicle with the roof opening panel in the CLOSED and OPEN position. • **Is the wind noise present only in the open position?**	**Yes** GO to A4 . **No** GO to A2 .
A2 CHECK THE ROOF OPENING PANEL ADJUSTMENT	
• Check the roof opening panel adjustment. • **Is the adjustment OK?**	**Yes** GO to A3 . **No** ADJUST the roof opening panel. REFER to Roof Opening Panel Alignment — Horizontal Adjustment and Roof Opening Panel Alignment — Height Adjustment in this section.
A3 CHECK THE ROOF OPENING PANEL WEATHERSTRIP	
NOTE: Make sure the weatherstrip is secured to the glass, not cut, cracked, pinched, loose or obstructed in CLOSED, VENT and OPEN position. • Check the roof opening panel weatherstrip. • **Is the roof opening panel weatherstrip OK?**	**Yes** If still in question, compare to like unit. **No** INSTALL a new roof opening panel weatherstrip. REFER to Roof Opening Panel Weatherstrip in this section.
A4 CHECK THE AIR DEFLECTOR	
• Make sure the air deflector is securely attached and check for torn and unsecured tethers. • **Is the air deflector OK?**	**Yes** GO to A5 . **No** INSTALL new air deflector assembly. REFER to Air Deflector in this section.
A5 CHECK THE AIR DEFLECTOR FOR VIBRATION	
• Road test the vehicle and check	**Yes**

for air deflector vibration. • **Did the air deflector vibrate?**	MODIFY the curvature of the air deflector by slightly bending it upward or downward at its center. The top center edge of the air deflector should be approximately 6-8 mm (0.23-0.31 in) above the roof line at the center of the vehicle. TEST the system for normal operation. **No** PARTIALLY close the roof opening panel until the noise is eliminated. If the noise is eliminated, inform the customer that changing glass location will eliminate the wind noise. If the wind noise is not eliminated, INSTALL a new air deflector. REFER to Air Deflector in this section.

Pinpoint Test B: The Roof Opening Panel Leaks

Normal Operation

During normal operation, when the roof opening panel glass is completely closed, it is flush with the roof panel and correctly sealed. The drain channel collects water and drains it through the front drain hose(s) located in the A-pillar and the rear drain hose(s) located in the C-pillar.

Possible Causes

- Roof opening panel glass adjustment
- Roof opening panel drain hoses
- Roof opening panel glass seal(s)
- Sealant joints at frame (rail and track assembly) joints

PINPOINT TEST B: THE ROOF OPENING PANEL LEAKS

Test Step	Result / Action to Take
B1 VERIFY CUSTOMER OPERATION OF THE ROOF OPENING PANEL WHEN PARKED	
• Make sure the customer is parking with the roof opening panel in the CLOSED position. • **Is the customer parking with the roof opening panel in the CLOSED position?**	**Yes** GO to B2. **No** INSTRUCT the customer to refer to the owner's manual for correct operation of the roof opening panel.
B2 CHECK THE ADJUSTMENT OF THE ROOF OPENING PANEL	
• Make sure the roof opening panel glass is centered and flush with the roof line. • **Is the roof opening panel adjusted correctly?**	**Yes** GO to B3. **No** ADJUST the roof opening panel. REFER to Roof Opening Panel Alignment — Horizontal Adjustment and Roof Opening Panel Alignment — Height Adjustment in this section. TEST the system for normal operation.
B3 CHECK THE WEATHERSTRIP CONDITION	
NOTE: The seal has a bonded joint located on	**Yes**

the passenger side or rear edge. This is not a defect. • Make sure the roof opening panel seal is not cracked, torn or loose. • Check the roof opening panel seal. • **Is the roof opening panel seal in good condition and free from damage?**	GO to B4 . **No** INSTALL a new roof opening panel seal. TEST the system for normal operation.
B4 CHECK THE WATER TROUGH CONDITION	
• Check the water trough and guides for damage and/or incorrect attachment and function. • **Is the water trough OK?**	**Yes** GO to B5 . **No** REPAIR the water trough or INSTALL a new component as necessary. TEST the system for normal operation.
B5 CHECK THE DRAIN HOSES	
NOTE: Drain hoses can be viewed with a flashlight by removing the headliner lace around the inside opening and gently pulling down on the headliner. (On some vehicles, Velcro-style attachments have been installed in place of the trim lace.) • Make sure the drain hoses are all connected and not cracked, slit, pinched or obstructed. • **Are all the drain hoses present and attached correctly?**	**Yes** GO to B6 . **No** REPAIR or INSTALL a new drain hose(s). TEST the system for normal operation.
B6 CHECK THE DRAIN HOSES FOR CORRECT FLOW	
NOTE: Drain hoses must flow downhill and cannot be pinched or restricted by headliner or any other trim components. • With the panel in the OPEN position, slowly pour water into the water trough area and make sure that the same amount of water exits the vehicle at the bottom of the A- and C-pillars. • Check the drain hoses for obstructions by blowing compressed air through the drain spouts in the water trough area, then retest the water. • **Are the drain hoses operating correctly?**	**Yes** INSPECT other areas of the vehicle that may cause water to enter the roof area, such as, the windshield or luggage rack if equipped. If no concerns are found, GO to B7 . **No** Lower the headliner and INSPECT the drain hoses for correct routing. REPAIR or INSTALL a new drain hose(s). TEST the system for normal operation.
B7 CHECK THE CONDITION OF THE ROOF OPENING PANEL FRAME	
• Check the roof opening panel frame for damage that may cause the roof opening panel seal to seat incorrectly. • **Is the roof opening panel frame OK?**	**Yes** INSTALL a new roof opening panel. REFER to Roof Opening Panel in this section. TEST the system for normal operation. **No** REPAIR the roof opening panel frame as necessary. TEST the system for normal operation.

Pinpoint Test C: The Roof Opening Panel Rattles

Normal Operation

During normal operation, when the roof opening panel is completely closed, it is flush with the roof panel. All components should be secured correctly.

Possible Causes

- Roof opening panel glass adjustment
- Roof opening panel lifter assemblies
- Roof opening panel tracks
- Roof opening drain channels (water trough) and guides
- Roof opening panel shield (sunshade)
- Roof opening panel air deflector
- Roof opening panel assembly

PINPOINT TEST C: THE ROOF OPENING PANEL RATTLES

Test Step	Result / Action to Take
C1 CHECK THE ROOF OPENING PANEL GLASS SCREWS FOR TIGHTNESS	
• Manually push up and fore/aft. • **Are the roof opening panel glass screws loose?**	**Yes** ADJUST the roof opening panel. REFER to Roof Opening Panel Alignment — Horizontal Adjustment and Roof Opening Panel Alignment — Height Adjustment in this section. TEST the system for normal operation. **No** GO to C2.
C2 CHECK THE ROOF OPENING PANEL TRACKS	
• Open the roof opening panel. • Check the roof opening panel tracks for obstructions and damage. • **Are the roof opening panel tracks OK?**	**Yes** GO to C3. **No** REMOVE all the roof opening panel track obstructions and REPAIR the roof opening panel tracks. TEST the system for normal operation.
C3 CHECK THE ROOF OPENING PANEL WATER TROUGH AND REAR TROUGH GUIDES	
• Check the roof opening panel water trough and rear trough guides for any loose obstructions. • **Are the roof opening panel water trough and rear trough guides installed securely and free from obstructions?**	**Yes** GO to C4. **No** REMOVE all obstructions from the roof opening panel water trough and INSTALL securely. SECURE the rear trough guides or INSTALL new roof opening panel rear trough guides if damaged. REFER to Roof Opening Panel Rear Trough Guide in this section. TEST the system for normal operation.
C4 CHECK THE ROOF OPENING PANEL SHIELD (SUNSHADE)	
• Check the roof opening panel shield (sunshade) for correct installation with all 4 tabs in the track channels. • **Is the roof opening panel**	**Yes** GO to C5. **No** INSTALL the roof opening panel shield correctly. TEST

shield installed correctly?	the system for normal operation.
C5 CHECK THE ROOF OPENING PANEL AIR DEFLECTOR ASSEMBLY	
• Check the roof opening panel air deflector assembly for obstructions, damage and incorrect attachments. • **Is the roof opening panel air deflector assembly OK?**	**Yes** GO to C6 . **No** REMOVE all obstructions and REPAIR or INSTALL a new roof opening panel air deflector assembly. REFER to Air Deflector in this section. TEST the system for normal operation.
C6 CHECK THE ROOF OPENING PANEL LIFTER ASSEMBLIES	
• Verify the roof opening panel lifter assemblies are free from obstructions and damage. • **Are the roof opening panel lifter assemblies OK?**	**Yes** GO to C7 . **No** REMOVE all obstructions from the roof opening panel lifter assemblies and REPAIR any damage. If the lifter assemblies cannot be repaired, INSTALL a new roof opening panel frame. REFER to Roof Opening Panel Frame in this section. TEST the system for normal operation.
C7 CHECK THE ROOF OPENING PANEL FRAME ATTACHMENTS	
• Check for correct torque and installation of the roof opening panel frame. • **Is the roof opening panel correctly installed and tightened to specification?**	**Yes** GO to C8 . **No** TIGHTEN or REINSTALL the roof opening panel frame. REFER to Roof Opening Panel Frame in this section. TEST the system for normal operation.
C8 CHECK THE ROOF OPENING PANEL FRAME TO HEADLINER FOR RATTLES	
• Check the roof opening panel frame to headliner for any interference condition that would induce a rattle. • **Is there a condition that will cause rattles?**	**Yes** INSTALL a suitable sound damper material to correct the condition. If the rattle still persists, INSTALL a new roof opening panel frame. REFER to Roof Opening Panel Frame in this section. TEST the system for normal operation. **No** INSTALL a new roof opening panel frame. REFER to Roof Opening Panel Frame in this section. TEST the system for normal operation.

Pinpoint Test D: The Roof Opening Panel Is Noisy During Operation

Normal Operation

During normal operation, the roof opening panel operates smoothly while opening and closing.

Possible Causes

- Roof opening panel glass adjustment
- Roof opening panel tracks

- Roof opening panel shield (sunshade)
- Roof opening panel motor

PINPOINT TEST D: THE ROOF OPENING PANEL IS NOISY DURING OPERATION

Test Step	Result / Action to Take
D1 CHECK THE ROOF OPENING PANEL FOR OBSTRUCTIONS OR DAMAGE • Check the roof opening panel for any obstructions and damage. • **Are there any obstructions and/or damage?**	**Yes** REMOVE all obstructions. REPAIR any damage or INSTALL a new roof opening panel frame. REFER to Roof Opening Panel Frame in this section. TEST the system for normal operation. **No** GO to D2.
D2 CHECK THE ROOF OPENING PANEL OPERATION • Check the roof opening panel during operation. • **Is the roof opening panel loose or incorrectly adjusted?**	**Yes** ADJUST the roof opening panel. REFER to Roof Opening Panel Alignment — Horizontal Adjustment and Roof Opening Panel Alignment — Height Adjustment in this section. TEST the system for normal operation. **No** GO to D3.
D3 CHECK THE ROOF OPENING PANEL TRACKS • Open the roof. • Check the roof opening panel tracks for obstructions and damage. • **Are the roof opening panel tracks OK?**	**Yes** GO to D4. **No** REMOVE all obstructions and REPAIR any damage. TEST the system for normal operation.
D4 CHECK THE ROOF OPENING PANEL SHIELD (SUNSHADE) • Check the roof opening panel shield for correct movement. • **Is the roof opening panel shield moving correctly?**	**Yes** GO to D5. **No** REMOVE and REINSTALL the roof opening panel shield. REFER to Roof Opening Panel Shield in this section. TEST the system for normal operation.
D5 CHECK THE ROOF OPENING PANEL LIFTER ASSEMBLIES • Check the roof opening panel lifter assemblies for obstructions and damage. • **Are the roof opening**	**Yes** GO to D6. **No** REMOVE all obstructions and REPAIR any damage. If lifter

panel lifter assemblies OK?	assemblies cannot be repaired, INSTALL a new roof opening panel frame. REFER to Roof Opening Panel Frame in this section. TEST the system for normal operation.
D6 CHECK THE ROOF OPENING PANEL MOTOR	
• Remove the roof opening panel motor/module and leave the electrical connector connected. • Operate the roof opening panel to the full OPEN and CLOSED position. • **Does the motor make excessive noise?**	**Yes** INSTALL a new roof opening panel motor. REFER to Roof Opening Panel Motor in this section. TEST the system for normal operation. **No** REINSTALL the roof opening panel motor/module. TEST the system for normal operation. If the roof opening panel is still noisy, INSTALL a new roof opening panel frame. REFER to Roof Opening Panel Frame in this section. If the roof opening panel is no longer noisy, the system is operating correctly. The concern may have been caused by an incorrectly installed roof opening panel motor.

Pinpoint Test E: The Roof Opening Panel Does Not Open Or Close

Refer to Wiring Diagrams Cell 101 , Roof Opening Panel for schematic and connector information.

Normal Operation

During normal operation, the roof opening panel integrated motor/module assembly receives voltage on circuit CBP47 (GN/BU) when the ignition switch is in the ACC or ON position. The roof opening panel module is grounded through circuit GD143 (BK/VT). The roof opening panel integrated motor/module assembly provides a ground through circuit CPR37 (YE/GY) (switch common) to the roof opening panel switch. The roof opening panel switch applies the switch common (ground) to the roof opening panel motor/module assembly through circuits CPR31 (VT/BN), CPR39 (VT/WH) and CPR40 (YE/OG) when the switch is actuated. Pressing the tilt switch applies switch common (ground) to the roof opening panel integrated motor/module through circuit CPR31 (VT/BN). Pressing the close switch applies switch common (ground) to the roof opening panel integrated motor/module through circuit CPR40 (YE/OG). Pressing the open switch applies switch common (ground) to the roof opening panel integrated motor/module through CPR39 (VT/WH). Pressing the auto open switch applies switch common (ground) to the roof opening panel integrated motor/module through circuits CPR39 (VT/WH) and CPR31 (VT/BN).

Possible Causes

- Circuit breaker
- Open in circuit CBP47 (GN/BU), GD143 (BK/VT), CPR37 (YE/GY), CPR39 (VT/WH) or CPR40 (YE/OG)
- Roof opening panel switch
- Roof opening panel motor

PINPOINT TEST E: THE ROOF OPENING PANEL DOES NOT OPEN OR CLOSE

Test Step	Result / Action to Take
E1 CHECK THE ROOF OPENING PANEL LIFTER ASSEMBLIES FOR OBSTRUCTIONS OR DAMAGE	
• Check the roof opening panel lifter assemblies for obstructions and damage. • **Are the roof opening panel lifter assemblies OK?**	**Yes** GO to E2 . **No**

	REMOVE all obstructions and REPAIR any damage. If lifter assemblies cannot be repaired, INSTALL a new roof opening panel frame. REFER to Roof Opening Panel Frame in this section. TEST the system for normal operation.
E2 CHECK THE ROOF OPENING PANEL WATER TROUGH AND REAR TROUGH GUIDES	
• Check the water roof opening panel water trough and rear trough guides for any loose obstructions. • **Are the roof opening panel water trough and rear trough guides installed securely and free from obstructions?**	**Yes** GO to E3. **No** REMOVE all obstructions from the roof opening panel water trough and install securely. SECURE the rear trough guides or INSTALL new roof opening panel rear trough guides if damaged. REFER to Roof Opening Panel Rear Trough Guide in this section. TEST the system for normal operation.
E3 VERIFY THE ROOF OPENING PANEL ADJUSTMENT	
• Verify the roof opening panel is adjusted correctly. • **Is the roof opening panel adjusted correctly?**	**Yes** GO to E4. **No** ADJUST the roof opening panel. REFER to Roof Opening Panel Alignment — Horizontal Adjustment and Roof Opening Panel Alignment — Height Adjustment in this section. TEST the system for normal operation.
E4 CHECK THE ROOF OPENING PANEL MOTOR/MODULE FOR INITIALIZATION	
NOTE: The roof opening panel motor initialization procedure must be done when repairs are carried out on any part of the roof opening panel assembly, including whenever the roof opening panel motor/module has been removed from the roof opening panel assembly, a new roof opening panel motor/module has been installed or when a new roof opening panel assembly has been installed. Refer to Roof Opening Panel Motor Initialization in this section. • Carry out the Roof Opening Panel Motor Initialization procedure. Refer to Roof Opening Panel Motor Initialization in this section. • **If the concern still present?**	**Yes** GO to E5. **No** The system is operating correctly. The roof opening panel motor/module was uninitialized.
E5 CHECK THE POWER WINDOWS	
• Key in ON position. • Verify the power windows operate.	**Yes** GO to E6.

• **Do the power windows operate?**	**No** REFER to Section 501-11 to diagnose the accessory delay relay circuit.
E6 CHECK THE ROOF OPENING PANEL SWITCH	
• Carry out the roof opening panel switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Did the roof opening panel switch pass the component test?**	**Yes** GO to E7 . **No** INSTALL a new roof opening panel switch. TEST the system for normal operation.
E7 CHECK CIRCUIT CBP47 (GN/BU) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Roof Opening Panel Motor/Module C922. • Key in ON position. • Measure the voltage between roof opening panel motor/module C922-4, circuit CBP47 (GN/BU), harness side and ground.  A0083978 • **Is the voltage greater than 9 volts but less than 16 volts?**	**Yes** GO to E8 . **No** VERIFY the smart junction box (SJB) circuit breaker 47 (30A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.
E8 CHECK CIRCUIT GD143 (BK/VT) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between roof opening panel motor/module C922-3, circuit GD143 (BK/VT), harness side and ground.  A0084276 • **Is the resistance less than 5 ohms?**	**Yes** GO to E9 . **No** REPAIR the circuit. TEST the system for normal operation.
E9 CHECK CIRCUITS CPR37 (YE/GY), CPR39 (VT/WH) AND CPR40 (YE/OG) FOR AN OPEN	
• Disconnect: Roof Opening Panel Switch C930. • Measure the resistance between the roof opening panel motor/module C922-1, circuit CPR40 (YE/OG), harness side and roof opening panel switch C930-8, circuit CPR40 (YE/OG), harness side. Measure the resistance between roof opening	**Yes** GO to E10 . **No** REPAIR the circuit. TEST

panel motor/module C922-2, circuit CPR39 (VT/WH), harness side and roof opening panel switch C930-11, circuit CPR39 (VT/WH), harness side. Measure the resistance between roof opening panel motor/module C922-5, circuit CPR37 (YE/GY), harness side and roof opening panel switch C930-14, circuit CPR37 (YE/GY), harness side.  • **Are the resistances less than 5 ohms?**	the system for normal operation.

E10 CHECK FOR CORRECT ROOF OPENING PANEL MOTOR/MODULE OPERATION
• Disconnect the roof opening panel motor/module connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all roof opening panel motor/module connectors and make sure they seat correctly.
• Operate the system and verify that the concern is still present.
• **Is the concern still present?**
	Yes
	CHECK the jumper harness between the vehicle harness and the roof opening panel for open or shorted circuits. If the jumper harness is not OK, INSTALL a new jumper harness between the vehicle harness to the roof opening panel motor/module. Otherwise, INSTALL a new roof opening panel module/motor. REFER to Roof Opening Panel Motor in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test F: The Express Open Is Inoperative

Refer to Wiring Diagrams Cell 101 , Roof Opening Panel for schematic and connector information.

Normal Operation

The roof opening panel integrated motor/module assembly provides a ground through circuit CPR37 (YE/GY) (switch common) to the roof opening panel switch. The roof opening panel switch supplies the switch common (ground) to the roof opening panel motor/module assembly through circuits CPR31 (VT/BN), CPR39 (VT/WH) and CPR40 (YE/OG) when the switch is actuated. Pressing the tilt switch

applies switch common (ground) to the roof opening panel integrated motor/module through circuit CPR31 (VT/BN). Pressing the close switch applies switch common (ground) to the roof opening panel integrated motor/module through circuit CPR40 (YE/OG). Pressing the open switch applies switch common (ground) to the roof opening panel integrated motor/module through CPR39 (VT/WH). Pressing the auto open switch applies switch common (ground) to the roof opening panel integrated motor/module through circuits CPR39 (VT/WH) and CPR31 (VT/BN).

Possible Causes

- Open in circuit CPR31 (VT/BN) or CPR39 (VT/WH)
- Roof opening panel switch
- Roof opening panel motor

PINPOINT TEST F: THE EXPRESS OPEN IS INOPERATIVE

Test Step	Result / Action to Take
F1 CHECK THE ROOF OPENING PANEL MOTOR/MODULE FOR INITIALIZATION	
NOTE: The roof opening panel motor initialization procedure must be done when repairs are carried out on any part of the roof opening panel assembly, including whenever the roof opening panel motor/module has been removed from the roof opening panel assembly, a new roof opening panel motor/module has been installed or when a new roof opening panel assembly has been installed. Refer to Roof Opening Panel Motor Initialization in this section. • Carry out the Roof Opening Panel Motor Initialization procedure. Refer to Roof Opening Panel Motor Initialization in this section. • **If the concern still present?**	**Yes** GO to F2 . **No** The system is operating correctly. The roof opening panel motor/module was uninitialized.
F2 CHECK THE ROOF OPENING PANEL SWITCH	
• Disconnect: Roof Opening Panel Switch C930. • Carry out the roof opening panel switch component test. Refer to Wiring Diagrams cell 149 for schematic and connector information. • **Did the roof opening panel switch pass the component test?**	**Yes** GO to F3 . **No** INSTALL a new roof opening panel switch. TEST the system for normal operation.
F3 CHECK CIRCUIT CPR31 (VT/BN) and CPR39 (VT/WH) FOR AN OPEN	
• Disconnect: Roof Opening Panel Motor/Module C922. • Measure the resistance between roof opening panel motor/module C922-2, circuit CPR39 (VT/WH), harness side and roof opening panel switch C930-11, circuit CPR39 (VT/WH), harness side; and between roof opening panel motor/module C922-6, circuit CPR31 (VT/BN), harness side and roof opening panel switch C930-10, circuit CPR31 (VT/BN), harness side.	**Yes** GO to F4 . **No** REPAIR the circuit. TEST the system for normal operation.

 N0054599 • **Is the resistance less than 5 ohms for both measurements?**	

F4 CHECK FOR CORRECT ROOF OPENING PANEL MOTOR/MODULE OPERATION
• Disconnect the roof opening panel motor/module connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all roof opening panel motor/module connectors and make sure they seat correctly.
• Operate the system and verify that the concern is still present.
• **Is the concern still present?**
	Yes
	CHECK the jumper harness between the vehicle harness and the roof opening panel for open or shorted circuits. If the jumper harness is not OK, INSTALL a new jumper harness between the vehicle harness to the roof opening panel motor/module. Otherwise, INSTALL a new roof opening panel module/motor. REFER to Roof Opening Panel Motor in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Roof Opening Panel Motor Initialization

Printable View (80 KB)

CAUTION: Be sure there are no obstructions in the path of the roof opening panel glass before attempting to initialize the roof opening panel motor.

NOTE: A new roof opening panel motor will only open and must be initialized.

NOTE: The roof opening panel motor initialization procedure must be done when repairs are carried out on any part of the roof opening panel system, including: any time the roof opening panel motor has been removed from the roof opening panel assembly, a new roof opening panel motor has been installed or when a new roof opening panel assembly has been installed.

1. Turn the ignition to the RUN position. For an existing roof opening panel motor, proceed to Step 3.

2. **NOTE:** If the open switch is released before initialization movements are complete, turn the ignition key to the OFF position, then back to the RUN position and repeat this step.

   For a new roof opening panel motor/module:
   - Press the open switch until the roof opening panel moves past the full OPEN position and continue to hold for approximately 10 seconds. The roof opening panel will cycle slightly rearward and then slightly forward to the stored OPEN position. Release the switch at this point.
   - Press and hold the open switch. The roof opening panel glass will move to the full TILT position, then back to CLOSED (initialization movements). The initialization movements will start within approximately 3 seconds after the switch is pressed. When the initialization movements are complete, go to Step 4.

3. **NOTE:** All roof opening panel motor/module assemblies have an electronically controlled comfort STOP position, which is approximately 50 mm (2 in) from the full OPEN position. When the roof opening panel is opened, the open switch must be released when the comfort STOP position has been reached and then pressed again to fully open the roof opening panel.

   NOTE: If the open switch is released before initialization movements are complete, turn the ignition key to the OFF position, then back to the RUN position, and repeat this step.

   For an existing roof opening panel motor/module:
   - Press and hold the open switch until the roof opening panel glass moves to the full OPEN position.
   - Press and hold the open switch (for approximately 10 seconds) until the roof opening panel glass moves past full OPEN, then back to full OPEN. Quickly release the switch.
   - Press and hold the open switch. The roof opening panel glass will move to full TILT, then back to CLOSED (initialization movements). The initialization movements will start within approximately 3 seconds after the switch is pressed.

4. Release the open switch and test the system for normal operation by carrying out one-touch open to comfort STOP, full OPEN, close from full OPEN to full CLOSE and TILT operations.

Roof Opening Panel Alignment — Horizontal Adjustment

Printable View (80 KB)

NOTE: The roof opening panel motor must be initialized when repairs are carried out on any part of the roof opening panel, including: whenever the roof opening panel motor has been removed from the roof opening panel assembly, a new roof opening panel motor has been installed or when a new roof opening panel assembly has been installed. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

1. Position the roof opening panel in the CLOSED position.
2. Loosen the 2 roof opening panel glass screws on the driver side.
3. **CAUTION: Use care to avoid scratching the roof or damaging the roof opening panel seal.**

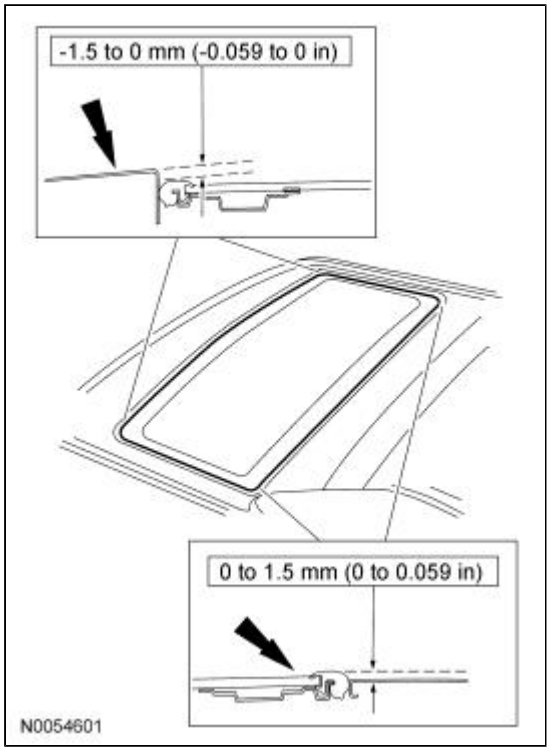
   Insert a plastic shim (or similar tool) with a thickness of approximately 3 mm between the rear of the roof opening panel seal and the roof opening panel.
4. Gently move the roof opening panel forward.
5. Tighten the roof opening panel glass screws to 4 Nm (35 lb-in).
6. Repeat for the passenger side.
7. Using a 0.5 mm (0.02 in) feeler or suitable gauge, inspect the seal contact around the entire roof opening panel glass.
8. Reinitialize the roof opening panel motor. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

Roof Opening Panel Alignment — Height Adjustment

Printable View (105 KB)

NOTE: The roof opening panel motor must be initialized when repairs are carried out on any part of the roof opening panel, including: whenever the roof opening panel motor has been removed from the roof opening panel assembly, a new roof opening panel motor has been installed or when a new roof opening panel assembly has been installed. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

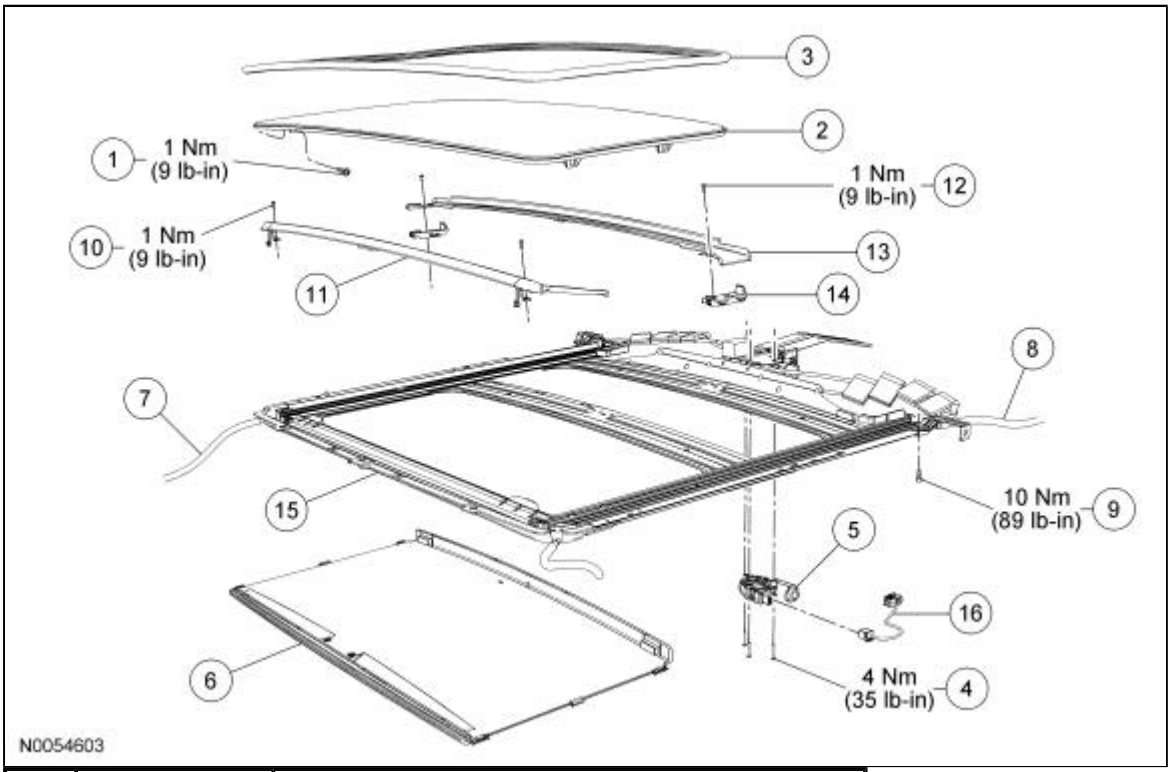
1. Position the roof opening panel in the CLOSED position.
2. Loosen the 4 roof opening panel glass screws.
3. Position the roof opening panel to the roof panel as specified.



4. Maintain the horizontal and vertical roof opening panel position, while adjusting and tighten the 4 roof opening panel screws to 4 Nm (35 lb-in).
5. Reinitialize the roof opening panel motor. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

Roof Opening Panel — Exploded View

Printable View (143 KB)



Item	Part Number	Description

1. For additional information, refer to the procedures in this section.

Roof Opening Panel

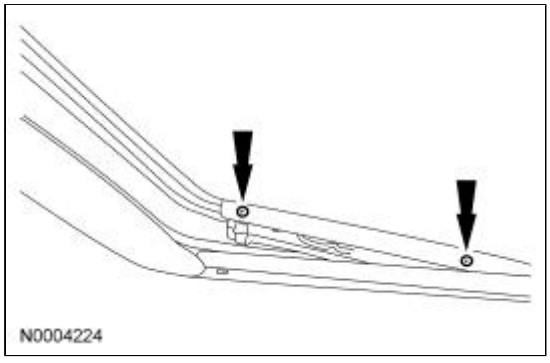
Printable View (97 KB)

Removal and Installation

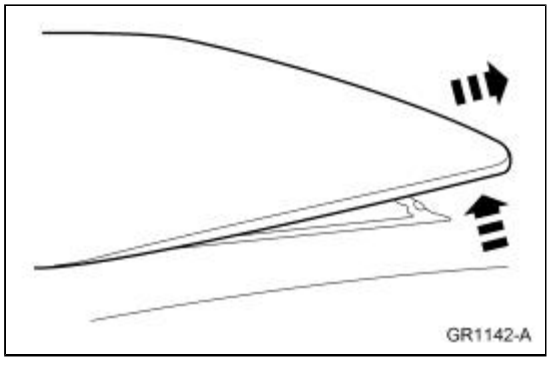
NOTE: The roof opening panel must be initialized when repairs are carried out on any part of the roof opening panel, including: whenever the roof opening panel has been removed from the roof opening panel assembly, a new roof opening panel motor/module has been installed or when a new roof opening panel assembly has been installed. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

1. Position the roof opening panel in the VENT position.

2. Remove the 4 roof opening panel glass screws.
   - To install, tighten to 4 Nm (35 lb-in).



3. Remove the roof opening panel from the outside of the vehicle by lifting up and out.



4. To install, reverse the removal procedure.
   - Adjust the roof opening panel. For additional information, refer to Roof Opening Panel Alignment — Height Adjustment and Roof Opening Panel Alignment — Horizontal Adjustment in this section.

Roof Opening Panel Rear Trough Guide

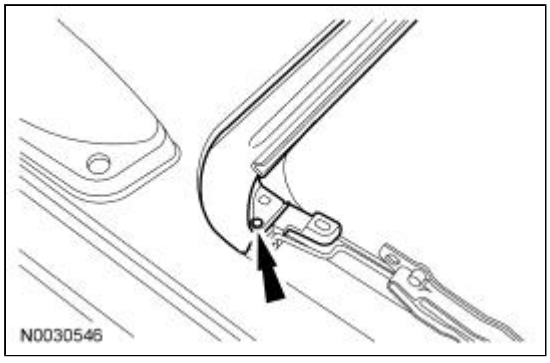
Printable View (185 KB)

Removal and Installation

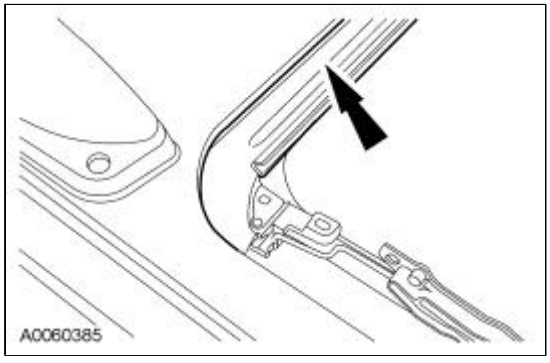
NOTE: The roof opening panel must be initialized when repairs are carried out on any part of the roof opening panel, including: whenever the roof opening panel has been removed from the roof opening panel assembly, a new roof opening panel motor/module has been installed or when a new roof opening panel assembly has been installed. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

1. Remove the roof opening panel. For additional information, refer to Roof Opening Panel in this section.

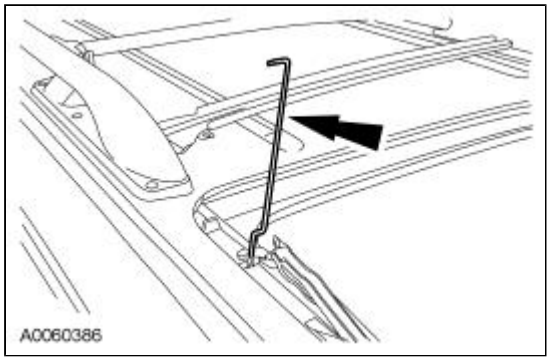
2. Remove the 2 trough guide retaining screws.
   - To install, tighten to 1 Nm (9 lb-in).



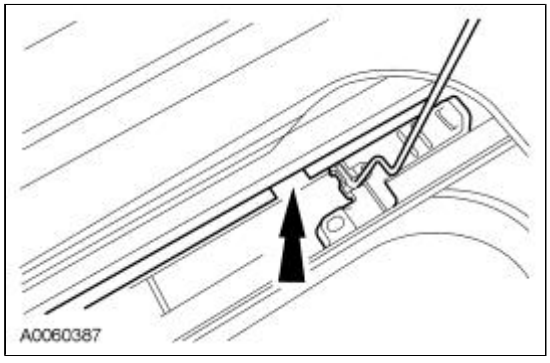
3. Remove the trough from the trough guide assembly.



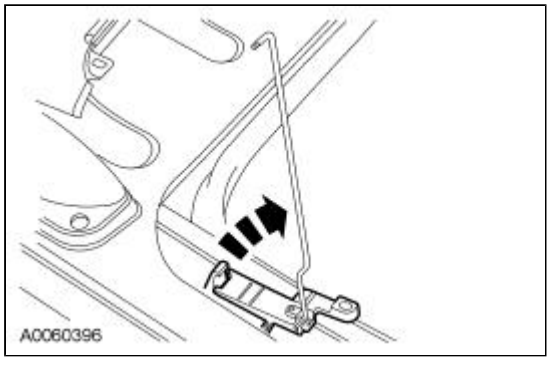
4. Disconnect the trough guide rods from the lifter arm assemblies.



5. Slide the trough guide back to the slot (approximately 15 mm [0.6 in]) cut in track.



6. Carefully twist trough guide through the slot in the track to remove.



7. Inspect the trough guide assembly for damage. If damage is found, inspect the track for broken pieces and remove them.

8. To install, reverse the removal procedure.

9. Adjust roof opening panel. For additional information, refer to Roof Opening Panel Alignment — Height Adjustment and Roof Opening Panel Alignment — Horizontal Adjustment in this section.

Roof Opening Panel Shield

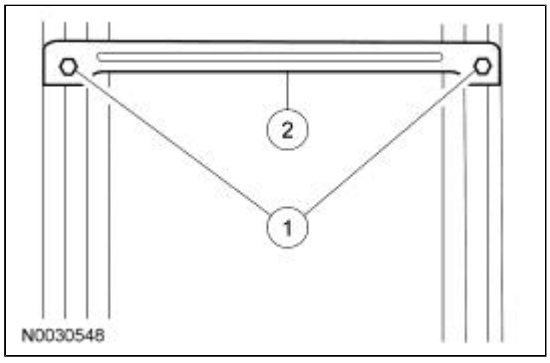
Printable View (105 KB)

Removal and Installation

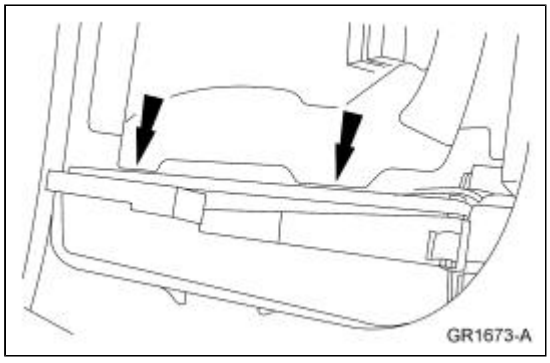
NOTE: The roof opening panel must be initialized when repairs are carried out on any part of the roof opening panel, including: whenever the roof opening panel has been removed from the roof opening panel assembly, a new roof opening panel motor/module has been installed or when a new roof opening panel assembly has been installed. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

1. Remove the roof opening panel glass. For additional information, refer to Roof Opening Panel in this section.

2. Remove the water trough.
   1. Remove the 2 screws.
      - To install, tighten to 1 Nm (9 lb-in).
   2. Remove the water trough.



3. Flex the opening shield to remove the guides from the tracks and remove the roof opening panel shield.



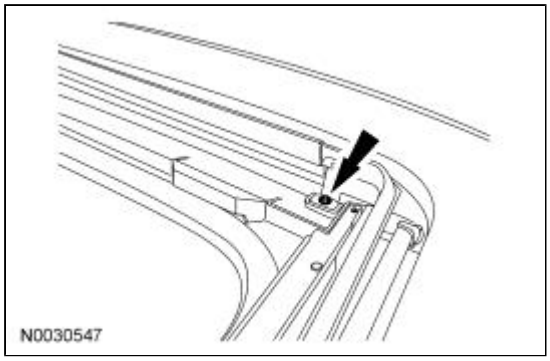
4. To install, reverse the removal procedure.

Air Deflector

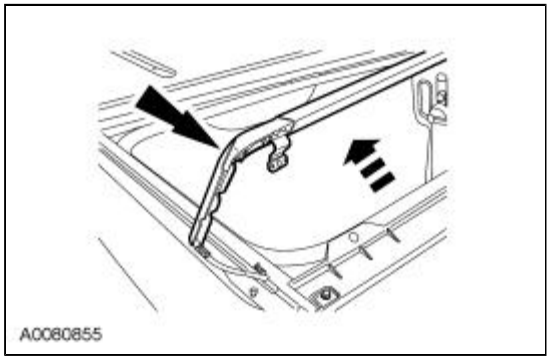
Printable View (138 KB)

1. Open the roof opening panel.
2. **NOTE:** RH side shown, LH similar.

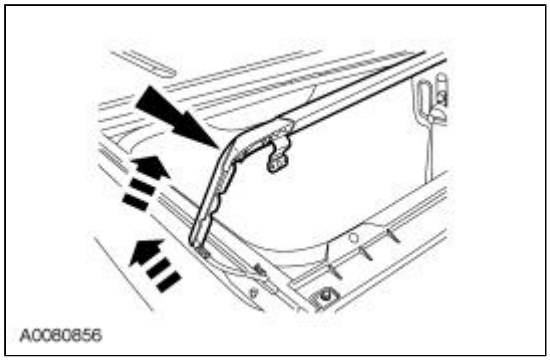
   Remove the 2 air deflector tether screws.
   - To install, tighten to 1 Nm (9 lb-in).



3. Raise the front of the air deflector.



4. Slide the air deflector toward the rear, then lift up to release it from the pivot shafts.



5. To install, reverse the removal procedure.

Roof Opening Panel Weatherstrip

Printable View (99 KB)

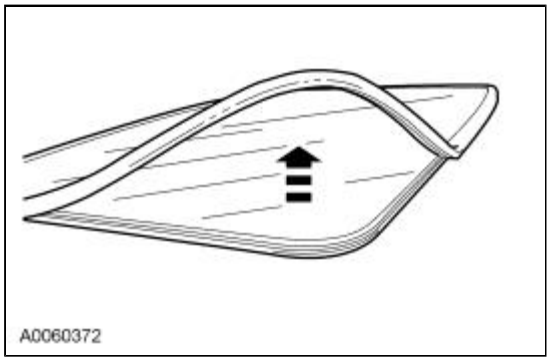
Removal

NOTE: The roof opening panel must be initialized when repairs are carried out on any part of the roof opening panel, including: whenever the roof opening panel has been removed from the roof opening panel assembly, a new roof opening panel motor/module has been installed or when a new roof opening panel assembly has been installed. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

1. Remove the roof opening panel. For additional information, refer to Roof Opening Panel in this section.

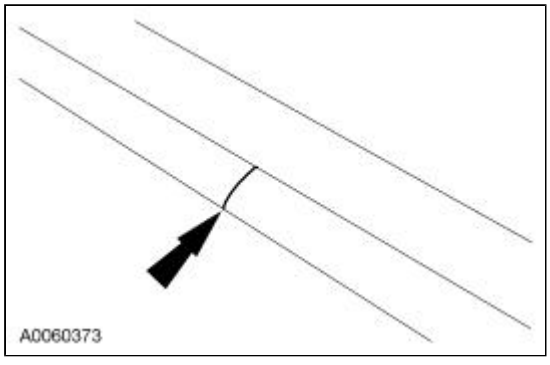
2. Place roof opening panel, topside up, on a worktable. Take care to support the glass assembly from below to prevent damaging the mounting tabs.

3. Remove the old roof opening panel weatherstrip by pulling up on the weatherstrip.



Installation

1. Place a new weatherstrip into position on the glass assembly, with the splice (seam) on the passenger side.



2. Starting with the corners, push the weatherstrip into position. Continue pushing the weatherstrip into position around the glass assembly until complete. Use a plastic or rubber hammer if necessary.

3. Install the roof opening panel. For additional information, refer to Roof Opening Panel in this section.

4. Adjust the roof panel. For additional information, refer to Roof Opening Panel Alignment — Height Adjustment and Roof Opening Panel Alignment — Horizontal Adjustment in this section.

Roof Opening Panel Motor

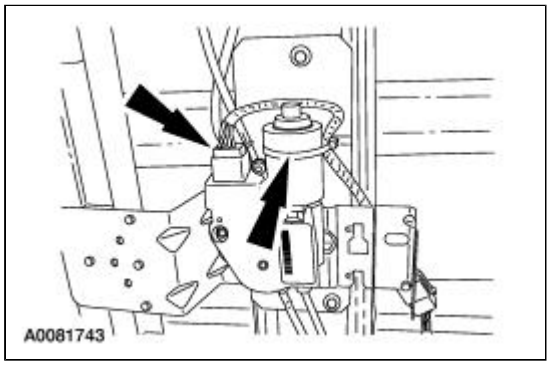
Printable View (118 KB)

Removal

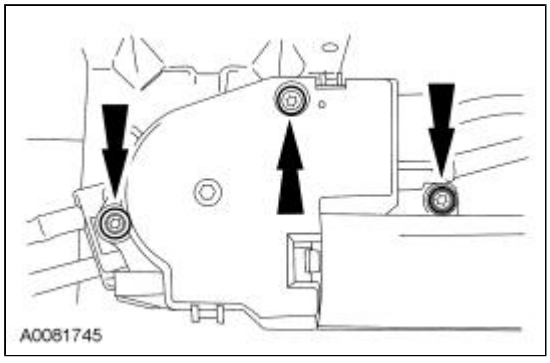
NOTE: The roof opening panel must be initialized when repairs are carried out on any part of the roof opening panel, including whenever the roof opening panel has been removed from the roof opening panel assembly, a new roof opening panel motor/module has been installed or when a new roof opening panel assembly has been installed. Refer to Roof Opening Panel Motor Initialization in this section.

1. Remove the headliner. For additional information, refer to Section 501-05 .

2. Disconnect the roof opening panel motor electrical connector and cut the tie strap.

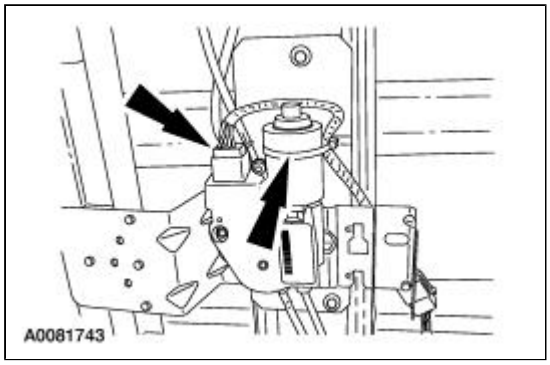


3. Remove the roof opening panel motor.
   - Remove the 3 screws.



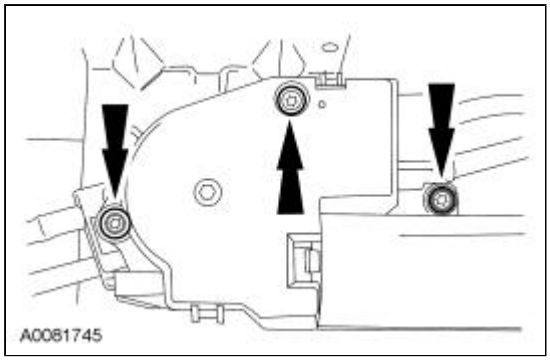
Installation

1. Connect the roof opening panel motor electrical connector. Install a new tie strap and trim off excess.



2. **NOTE:** When installing the roof opening panel motor/module, align the 3 attach holes before engaging the drive gear into the roof opening panel drive cable. Do not rotate the motor assembly after the drive gear is engaged with the roof opening panel drive cable. Otherwise, the cable can bind.

   Install the roof opening panel motor.
   - Align the attach holes, then install the 3 screws and tighten to 4 Nm (35 lb-in).



3. Connect the overhead console electrical connectors.

4. Initialize the roof opening panel motor/module. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

5. Disconnect the overhead console electrical connectors.

6. Install the headliner. For additional information, refer to Section 501-05 .

Roof Opening Panel Frame

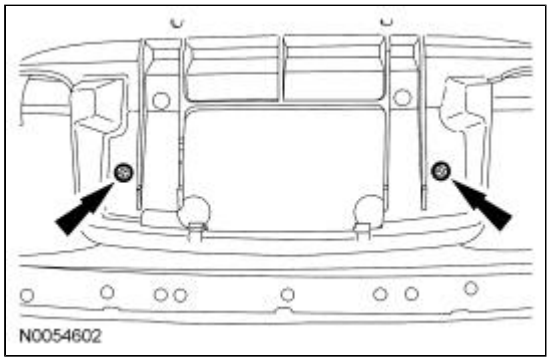
Printable View (138 KB)

Removal and Installation

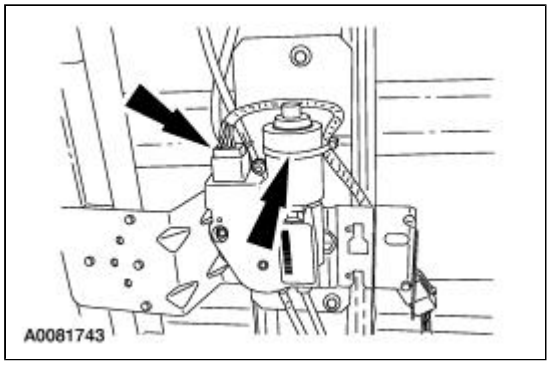
NOTE: The roof opening panel must be initialized when repairs are carried out on any part of the roof opening panel, including whenever the roof opening panel has been removed from the roof opening panel assembly, a new roof opening panel motor/module has been installed or when a new roof opening panel assembly has been installed. Refer to Roof Opening Panel Motor Initialization in this section.

1. Remove the headliner. For additional information, refer to Section 501-05 .

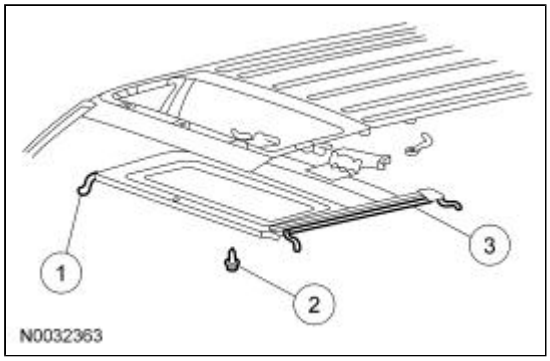
2. Remove the overhead console bracket.
   - Remove the screws.



3. Disconnect the electrical connector and cut the tie strap.



4. Remove the roof opening panel frame.
   1. Disconnect the 4 roof opening panel drain hoses.
   2. Remove the 11 bolts.
      - To install, tighten to 10 Nm (89 lb-in).
   3. Remove the roof opening panel frame.



5. To install, reverse the removal procedure. If a new roof opening panel frame is being installed, transfer the existing roof opening panel motor, air deflector, rear trough, roof opening panel glass and roof opening panel shield onto the new frame assembly.
    - Check for correct alignment of the roof opening panel. For additional information, refer to Roof Opening Panel Alignment — Horizontal Adjustment and Roof Opening Panel Alignment — Height Adjustment in this section.
    - Initialize the roof opening panel motor. Refer to Roof Opening Panel Motor Initialization in this section.

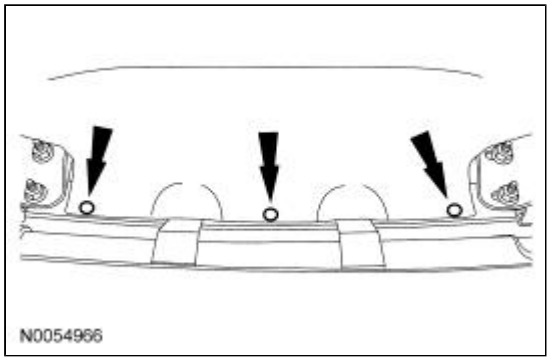
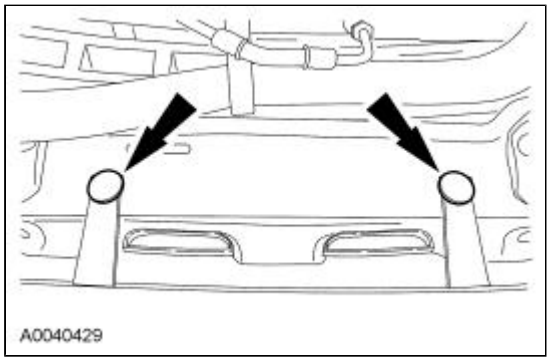
Removal and Installation

1. Remove the 3 lower air deflector pin-type retainers.
   - Position the air deflector aside.



2. Remove the 2 front bumper cover lower pin-type retainers.

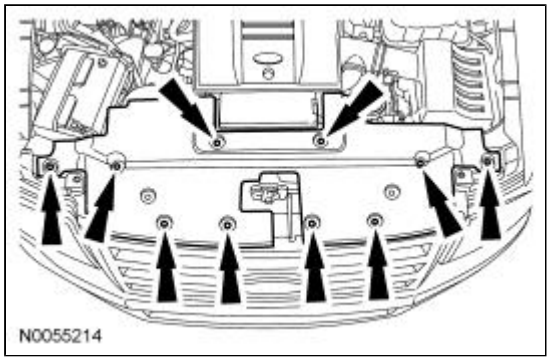


3. Remove the 4 LH and RH front fender splash shield screws.

4. Remove the 4 LH and RH front bumper cover-to-fender bolts.
   - To install, tighten to 11 Nm (8 lb-ft).

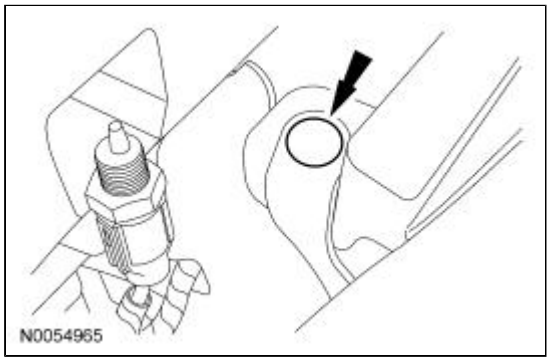
5. If equipped, disconnect the LH and RH fog lamp electrical connectors.

6. Remove the upper air deflector.
   - Remove the 10 pin-type retainers.



NOTE: Right side shown, left side similar.

7. Remove the 2 upper pin-type retainers for the lower air deflector.



8. Remove the 4 grille-to-radiator support bolts.
9. Remove the front bumper cover.
10. To install, reverse the removal procedure.

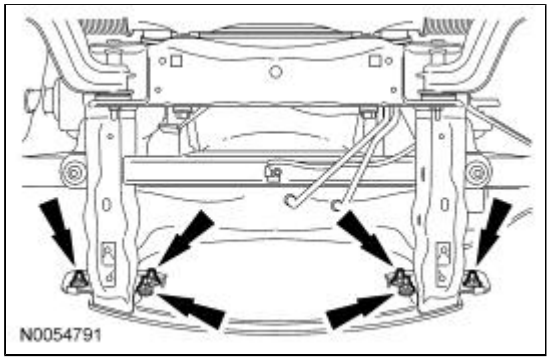
Bumper — Front

Printable View (92 KB)

Removal and Installation

1. Remove the front bumper cover. For additional information, refer to Bumper Cover — Front in this section.

2. Remove the front bumper.
   - Remove the 6 nuts.
   - To install, tighten to 90 Nm (66 lb-ft).



3. To install, reverse the removal procedure.

Safety Belt System

Printable View (92 KB)

WARNING: All safety belt assemblies (including retractors, belt tension sensor [BTS], if equipped, buckles, shoulder belt height adjusters [if equipped], child safety seat tether attachments and attaching hardware) should be inspected after every collision. All new belt assemblies should be installed unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and new assemblies installed if either damage or incorrect operation is noted. Failure to follow these instructions could increase the risk of injury in collisions.

NOTE: If equipped, the second and third row rear center safety belt retractors may be equipped with a web stop button (small, thin, round button) located on the safety belt webbing. This button is only used for vehicle assembly and serves no other functional purpose. The button can possibly be retracted under the trim bezel making it difficult to pull the safety belt webbing out of the retractor. To service, remove this web stop button. Do not replace the safety belt retractor to eliminate this condition. Any resulting appearance concerns with the webbing can be worked out by hand.

All outboard safety belts, and second and third row center safety belts (if equipped) are continuous-loop, 3-point systems. The combination lap and shoulder belt (continuous-loop) uses a common slip tongue and retractor.

The shoulder harness retractor is designed to let the webbing move freely in and out at all times, except during vehicle hard braking, hard cornering or impact of 8 km/h (5 mph) or more, when it is automatically locked by a mechanically actuated inertia sensor.

When replacing safety belt buckles and/or retractor assemblies, use only the replacement parts specified in the Ford Customer Service Division Master Parts and Accessories Catalog.

Active Restraint System Components

The active restraint system consists of the following components in the locations described.

- Driver and front row outboard passenger safety belt buckle pretensioners, attached to the front seats.
- Front row outboard safety belt retractor, attached to the B-pillar sheet metal behind the trim panel.
- Front row center safety belt, with 60/40 bench seat, attached on top of the rear inboard 60 percent seat.
- Front row center safety belt buckle, with 60/40 bench seat, attached to the floor pan under the 60 percent seat.
- Front row safety belt shoulder height adjuster, attached to the B-pillar sheet metal behind the trim panel.
- Second row outboard safety belt retractor, attached to the quarter panel sheet metal behind the trim panel.
- Second row inboard safety belt retractor, with 20 percent seat, attached to the seat backrest frame.
- Second row inboard safety belt buckle, with 20 percent seat, attached to the side of the seat.
- Second row outboard safety belt buckle, attached to the side of the seat.
- Second row 40/20/40 seating, having child safety seat tether anchors welded to the seat cushion frame at all seating positions.
- Second row 40 percent bucket seats, having child safety seat tether anchors welded to the seat cushion frame at both seating positions.

- Second row 40/20/40 seating, having LATCH welded to the seat at all 3 seating positions.
- Second row 40 percent bucket seats, having LATCH welded to the seat cushion frame at both seating positions.
- Third row outboard safety belt retractor, attached to the D-pillar sheet metal behind the trim panel.
- Third row inboard safety belt retractor, attached to the 60 percent seat backrest frame.
- Third row RH safety belt buckle, attached to the side of the seat.
- Third row LH and center safety belt buckle assembly, attached to the floor pan under the 60 percent third row seat.
- Third row center child safety seat tether anchor, bolted to the 60 percent seat backrest frame.

Safety Belt Buckle and Pretensioner

All vehicles have a pretensioner system used with the front outboard safety belt buckles. This works in conjunction with the front air bag system mounted in the steering wheel and instrument panel.

The safety belt buckle and pretensioners are for the front outboard occupants, located on the inboard side of the seats. This allows the front safety belt buckle end to move with the front seat.

The safety belt buckle and pretensioner is a pyrotechnic device that removes excess webbing from the safety belt system. When the front air bag system is deployed, the pretensioner in the buckle deploys, causing the buckle to move downward, pulling excess webbing from the lap and shoulder safety belts.

If the vehicle is involved in a collision that results in deployment of the front air bags and safety belt pretensioners, the driver and passenger seat belt system (including safety belt buckle and pretensioners, safety belt retractors and height adjusters) must be replaced.

If the ignition switch is turned to the ON or START position with the safety belt buckle pretensioner electrical connector(s) disconnected, the DTC and fault PIDs for an open circuit will be activated. For safety belt buckle pretensioner diagnostic information, refer to Section 501-20B .

For safety belt buckle pretensioner disposal information, refer to Section 501-20B .

Dual Locking Mode Retractors

WARNING: After any vehicle collision, the safety belt system at all outboard seating positions (except driver, which has no automatic locking retractor [ALR] feature) must be checked by a qualified technician to verify that the ALR feature for child seats is still functioning correctly, in addition to other checks for correct safety belt system function. A new belt and retractor assembly must be installed if the safety belt assembly's ALR feature, or any other safety belt function, is not operating correctly when checked according to the procedures in the workshop manual. Failure to install a new belt and retractor assembly could increase the risk of injury in collisions.

NOTE: When replacing a dual locking mode retractor, the retractor should be checked to make sure it is not in the automatic locking retractor (ALR) mode after installation in the stowed position.

All outboard continuous-loop, 3-point retractor systems, except the driver position, are equipped with the dual locking mode system.

The emergency locking retractor (ELR) mode will allow the occupant freedom of movement, locking tight only on hard braking, hard cornering or an impact of approximately 8 km/h (5 mph). The ELR mode helps to reduce the forward movement of the driver and passengers. The ELR mode is continuously in operation at all seating positions.

The automatic locking retractor (ALR) portion of this system does not allow the occupant freedom of movement. The ALR mode is used when locking a child seat in at a seating position or when a tight belt fit is desired. The ALR mode is automatically engaged when the webbing is fully extracted from the retractor and then allowed to retract. As the webbing is retracted back onto the spool, an audible clicking sound is made, indicating that the retractor is in ALR mode. The ALR mode is automatically disengaged when most of the webbing is retracted back onto the spool.

The automatic locking mode must be used when installing a child safety seat in the front or rear passenger seating positions where dual locking mode retractors are provided.

Energy Management Retractor

This vehicle has a safety belt system with an energy management feature at the front seating positions to help further reduce the risk of injury in the event of a head-on collision.

The energy management retractor feature is designed to pay out webbing in a controlled manner. This feature is designed to help reduce the belt force acting on the occupant's chest.

Safety Belt Extension Assembly

In certain cases, the safety belt may be too short, even when it is fully extended. About 20 cm (8 in) can be added to the belt length by using a safety belt extension. Safety belt extensions are available through any Ford or Lincoln Mercury dealer parts department at no cost. Safety belt extensions are only available with black webbing. There are 2 extension assemblies available, one for the front seating positions and one for the rear seating positions. They are not interchangeable. Only use extensions manufactured by the same supplier as the safety belt. Manufacturer identification is located at the end of the webbing on the label. Also, use the safety belt extension only if the safety belt is too short for you when fully extended. Do not use the extension to change the fit of the shoulder belt across the torso.

Attaching Safety Seats With Tether Straps

Some manufacturers make child safety seats that include a tether strap that goes over the back of the vehicle seat and attaches to an anchoring point. Other manufacturers offer the tether strap as an accessory. Contact the manufacturer of the child safety seat for information about ordering a tether strap.

Child safety seat tether anchors are manufactured into the vehicle. See the active restraint system component location at the beginning of this section or the owner's literature for locations.

For removal and installation of child safety seat tether anchors, refer to the appropriate procedure in this section or Section 501-10 for seat cushion frame replacement.

Lower Anchors and Tethers for Children (LATCH)

The lower anchors and tethers for children (LATCH) system is a standardized and uniform attachment system for installing child safety seats in passenger vehicles. LATCH-equipped child safety seats have 2 lower attachments that connect to the vehicle portion of the LATCH system.

The vehicle portion of the system consists of 2 attachment points (6 mm wires) welded to the rear seat cushion frame. The attachment points protrude from the bite line between the seat cushion and seat backrest.

If a child safety seat was in use during a collision, inspect the vehicle portion of the system for damage.

If any of the attachment points (6 mm wires) are damaged, install a new seat cushion frame.

Warning System — Driver Safety Belt

The driver safety belt incorporates a safety belt warning indicator switch, warning indicator and chime. The warning indicator and chime are reminders to fasten the safety belt.

- If the driver safety belt is not buckled before the ignition key is turned to ON, the safety belt warning light illuminates for 1 to 2 minutes and the warning chime sounds for 4 to 8 seconds.
- If the driver side safety belt is buckled while the indicator light is illuminated and the warning chime is sounding, the safety belt warning light and warning chime turn OFF.
- If the safety belt is buckled before the key is turned to the ON position, the warning indicator will come on for 4 to 8 seconds with no chime.

Belt Minder

The Belt Minder feature is a supplemental warning to the safety belt warning function. This feature provides additional reminders to the driver that the driver's safety belt is unbuckled by intermittently sounding a chime and illuminating the safety belt warning lamp in the instrument cluster.

To activate or deactivate the Belt Minder feature, refer to Section 413-09 or the owner's literature.

If...	Then...
The driver's safety belt is not buckled approximately 5 seconds after the safety belt warning light has turned off...	The Belt Minder feature is activated — the safety belt warning light illuminates and the warning chime sounds for 6 seconds every 30 seconds, repeating for approximately 5 minutes or until safety belt is buckled.
The driver's safety belt is buckled while the safety belt indicator light is illuminated and the safety belt warning chime is sounding...	The Belt Minder feature will not activate.
The driver's safety belt is buckled before the ignition switch is turned to the ON position...	The Belt Minder feature will not activate.

Safety Belt System

Printable View (89 KB)

Inspection and Verification

1. Verify the customer's concern by operating the active restraint system to duplicate the condition.
2. Inspect to determine if any of the following mechanical or electrical concerns apply:

Visual Inspection Chart

Mechanical	Electrical
• Safety belt webbing integrity • Safety belt buckle and tongue assembly • Safety belt retractor	• Open fuse • Bare, broken or disconnected wire • Connector not tightly engaged • Safety belt warning indicator lamp burned out or broken

3. If the inspection reveals an obvious concern(s) that can be readily identified, service as required. With the exception of removing a twist from the safety belt webbing, do not attempt to repair a component of the safety belt system; new components must be installed.
4. If the concern remains after the inspection, determine the symptom. GO to Symptom Chart .
5. To check the active restraint system for correct operation, carry out the appropriate Functional Test(s).

Symptom Chart

SYMPTOM CHART

Condition	Possible Sources	Action
• The safety belt warning indicator lamp does not operate, the safety belt warning chime is OK	• Burned-out bulb • Circuitry • Instrument cluster	• REFER to Section 413-01 .
• Neither the safety belt warning chime nor the safety belt warning indicator lamp operates	• Safety belt switch • Lighting control module • Restraint control module • Circuitry	• REFER to Section 501-20B .
• Excessive pressure on the	• Front safety	• CARRY OUT the

occupant during normal wear, the webbing cannot be extracted, excessive slack in webbing does not retract	belt retractor and tongue ● Rear safety belt retractor and tongue	component Functional Test in this section. INSTALL a new retractor if necessary.

Component Test

Carry out the appropriate Functional Test(s) as determined in Inspection and Verification.

Functional Test — Buckle and Tongue

The safety belt buckle and tongue assembly must operate freely during the latching and unlatching function. Fasten the safety belt by inserting the tongue (male portion) into the buckle (female portion).

1. Verify the following during the latching sequence:
    - Tongue insertion is not hindered by excessive effort.
    - A "click" is heard when the buckle latches the tongue.

2. Verify the system integrity by forcefully pulling on the belt webbing.

3. Unlatch the belt by fully depressing the buckle release button, and allowing the belt to release and retract.

4. Verify the following during the unlatching process:
    - Push-button depression does not require excessive effort.
    - Tongue can be removed easily from the buckle.
    - Repeat the above steps 3 times.

5. If the inspection reveals an obvious concern(s) that can be readily identified, install a new safety belt buckle or safety belt retractor assembly as required. Do not attempt to perform any repair on the buckle and tongue assembly. If a concern still exists with either component, a new safety belt buckle and safety belt and retractor assembly must also be installed.

Functional Test — Retractor

The safety belt and retractor assembly must be freely operational for extraction and retraction of the safety belt webbing between full extension and in-vehicle stowed positions.

1. Extract and retract the safety belt between the full extension and stowed positions.

2. Verify the retractor operates without excessive effort or binding.

3. Install a new safety belt buckle retractor and tongue assembly if no obvious concerns are noticed and the complaint has been verified.

Functional Test — System Road Test Inspection

1. **NOTE:** If the RH or the rear safety belts are to be tested, a passenger must be used.

Fasten the safety belts and proceed to a safe area.

2. Attain a speed of 8 km/h (5 mph).

3. **WARNING: The driver and passenger must be prepared to brace themselves if the retractor does not lock.**

   Test the safety belts.
   1. Grasp the shoulder harness and prepare to lean forward.
   2. **WARNING: The maximum brake application should be on dry concrete or equivalent hard surface, NEVER on wet pavement or gravel.**

      WARNING: The driver and passenger must be prepared to brace themselves in the event the retractor does not lock.

      NOTE: Do not jerk on the safety belt webbing when carrying out this test. Lean forward slightly when the brake application is made.

      Make a maximum brake application without a skid.

4. The safety belts should lock up with minimum webbing extension.

5. If there is a lockup of both shoulder straps, the safety belt assemblies are functioning correctly. Should either or both retractors fail to lock up at the 8 km/h (5 mph) speed, repeat the test at a constant 24 km/h (15 mph) speed. (This test must be carried out with a RH front or rear passenger if the RH front or rear outboard safety belts are to be tested.)

6. **CAUTION: Before installing a new safety belt assembly, inspect the mounting area for damage and distortion. If the retractor of a new safety belt assembly has been bolted into a damaged or distorted mounting area, the retractor could be warped and may not function. If this is the case, remove the retractor, return the sheet metal to the original configuration and install another complete safety belt assembly.**

   If either or both retractors do not lock up at the 24 km/h (15 mph) test, return the vehicle for service of malfunctioning safety belts.

Functional Test — Automatic Locking Retractor

WARNING: All safety belt assemblies (including retractors, belt tension sensors [BTS] if equipped, buckles, shoulder belt height adjusters [if equipped], child safety seat tether attachments and attaching hardware) should be inspected after any collision. All new belt assemblies should be installed unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and new assemblies installed if either damage or incorrect operation is noted.

The automatic locking retractor (ALR) feature of the safety belt retractor must be checked by a qualified technician to verify that the ALR feature for a child safety seat is functioning correctly, in addition to other checks for correct safety belt system function. A new belt and retractor assembly must be installed if the safety belt assembly's ALR feature, or any other safety belt function, is not operating correctly when inspected according to the functional inspection procedures in the workshop manual. Failure to install a new belt and retractor assembly could increase the risk of injury in collisions.

1. Position the seat back into the full up position.

2. Position the height adjuster in the full down or up position.

3. Latch the seat belt buckle and tongue assembly.

4. Pull the shoulder belt out until the automatic locking retractor (ALR) feature is activated.

5. Release the shoulder belt and allow it to retract until it stops.

6. Pull on the shoulder belt to check that the belt has remained in the ALR mode. If the belt is not locked, install a new safety belt and retractor assembly.

7. Unlatch the safety belt tongue from the buckle and allow the safety belt to retract to its stowed position.

8. Pull the shoulder belt to verify the retractor assembly has converted automatically out of the ALR mode. If the shoulder belt remains locked in the stowed position, install a new safety belt and retractor assembly.

Safety Belt Procedure After a Collision

Printable View (79 KB)

1. **WARNING: All safety belt assemblies (including retractors, belt tension sensor [BTS], if equipped, buckles, shoulder belt height adjusters [if equipped], child safety seat tether attachments and attaching hardware) should be inspected after every collision. All new belt assemblies should be installed unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and new assemblies installed if either damage or incorrect operation is noted. Failure to follow these instructions could increase the risk of injury in collisions.**

   NOTE: Safety belt assemblies should be periodically inspected to make sure they have not become damaged and that they remain in correct operating condition, particularly if they have been subjected to severe stress.

   Before installing the new safety belt assembly, the safety belt attaching areas must be inspected for damage and distortion. If the attaching points are damaged and distorted, the sheet metal must be reworked back to its original shape and structural integrity.

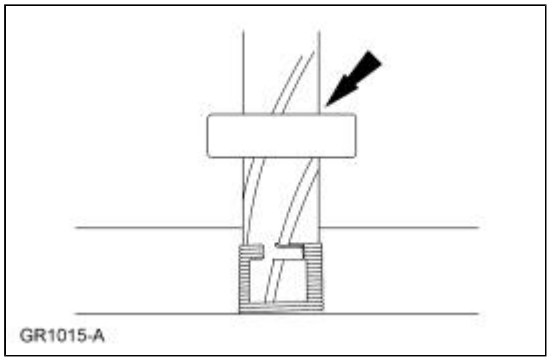
   Install the new safety belt(s) using the appropriate instructions. Carry out the Functional Test.

Safety Belt Shoulder Height Adjuster With Stripped Weld Nuts

Printable View (99 KB)

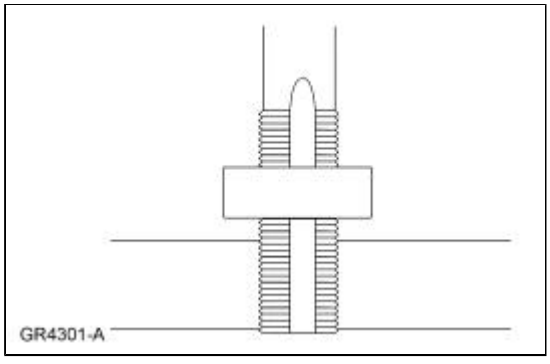
1. Remove the B-pillar trim panel. For additional information, refer to Section 501-05 .

2. Use the half-inch drill with integral stop to drill out the damaged threads in the upper pillar structure.

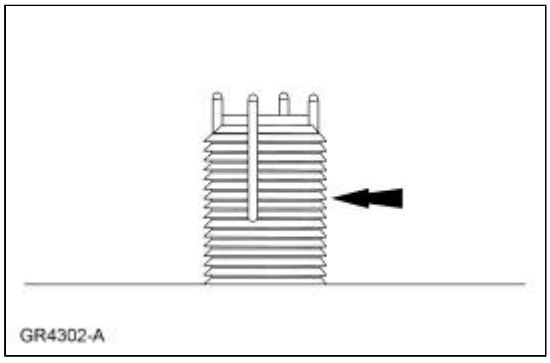


3. **NOTE:** After each rotation, back off tap slightly to remove new cuttings and be sure to blow out any chips before proceeding.

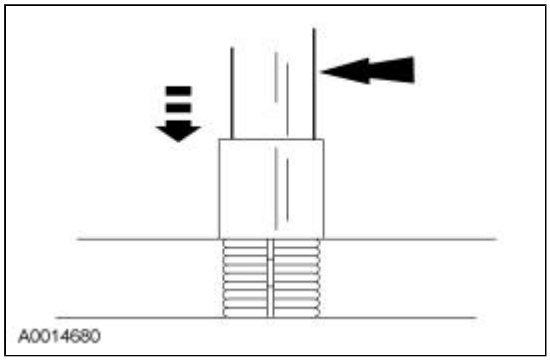
   Apply a suitable lubricant to the M14 x 1.5 tap with integral stop and tap new threads.



4. Use a threaded insert and screw it into the retapped hole until it is slightly below the surface.



5. Use a hammer to lightly tap the installation tool several times to seat the insert keys.

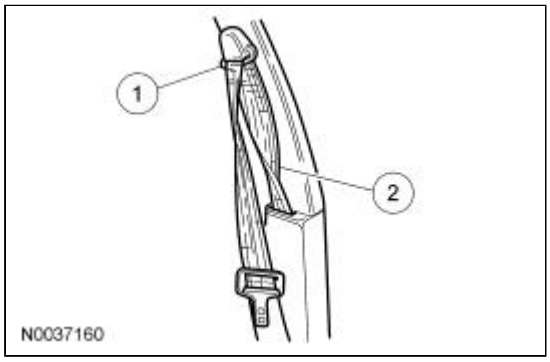


6. If the bolt(s) on the height adjuster is not stripped, reinstall the original safety belt shoulder height adjuster. If the bolt(s) is stripped, install a new safety belt shoulder height adjuster. For additional information, refer to the appropriate height adjuster procedure in this section.

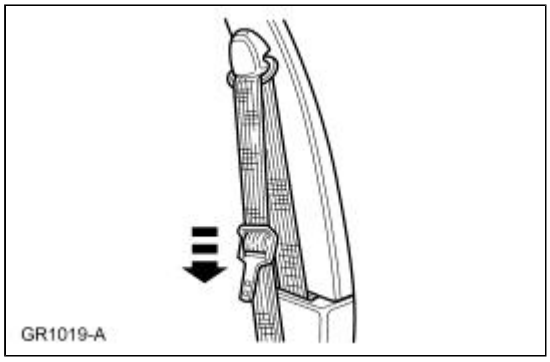
Safety Belt Twisted at the Safety Belt Guide — Outboard

Printable View (90 KB)

1. Straighten the twisted belt webbing.
    1. Grasp webbing at the safety belt guide.
    2. Feed twisted portion of webbing up through safety belt guide.



2. Pull straightened belt downward to check for correct operation.



Safety Belt Cleaning

Printable View (79 KB)

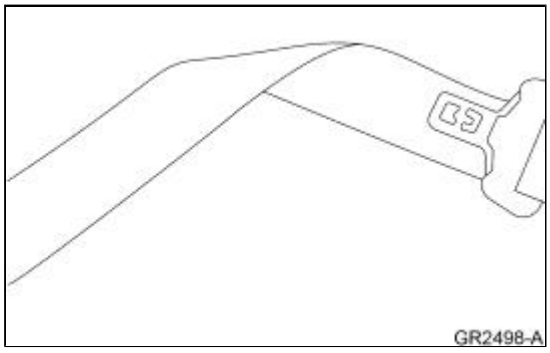
1. **WARNING: Do not bleach or re-dye the webbing, as the webbing may weaken.**

   Clean the safety belt webbing only with a mild soap solution recommended for cleaning upholstery or carpets. Follow the instructions provided with the soap.

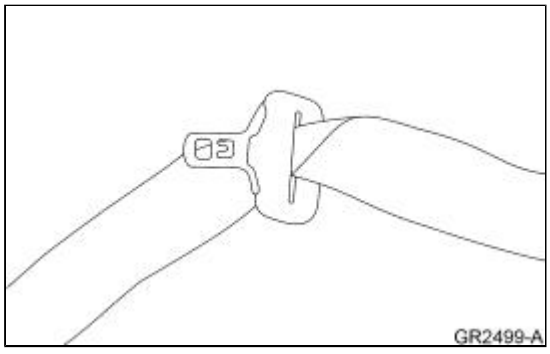
Safety Belt Tongue Rotated on Belt

Printable View (77 KB)

1. Fold the safety belt as indicated.

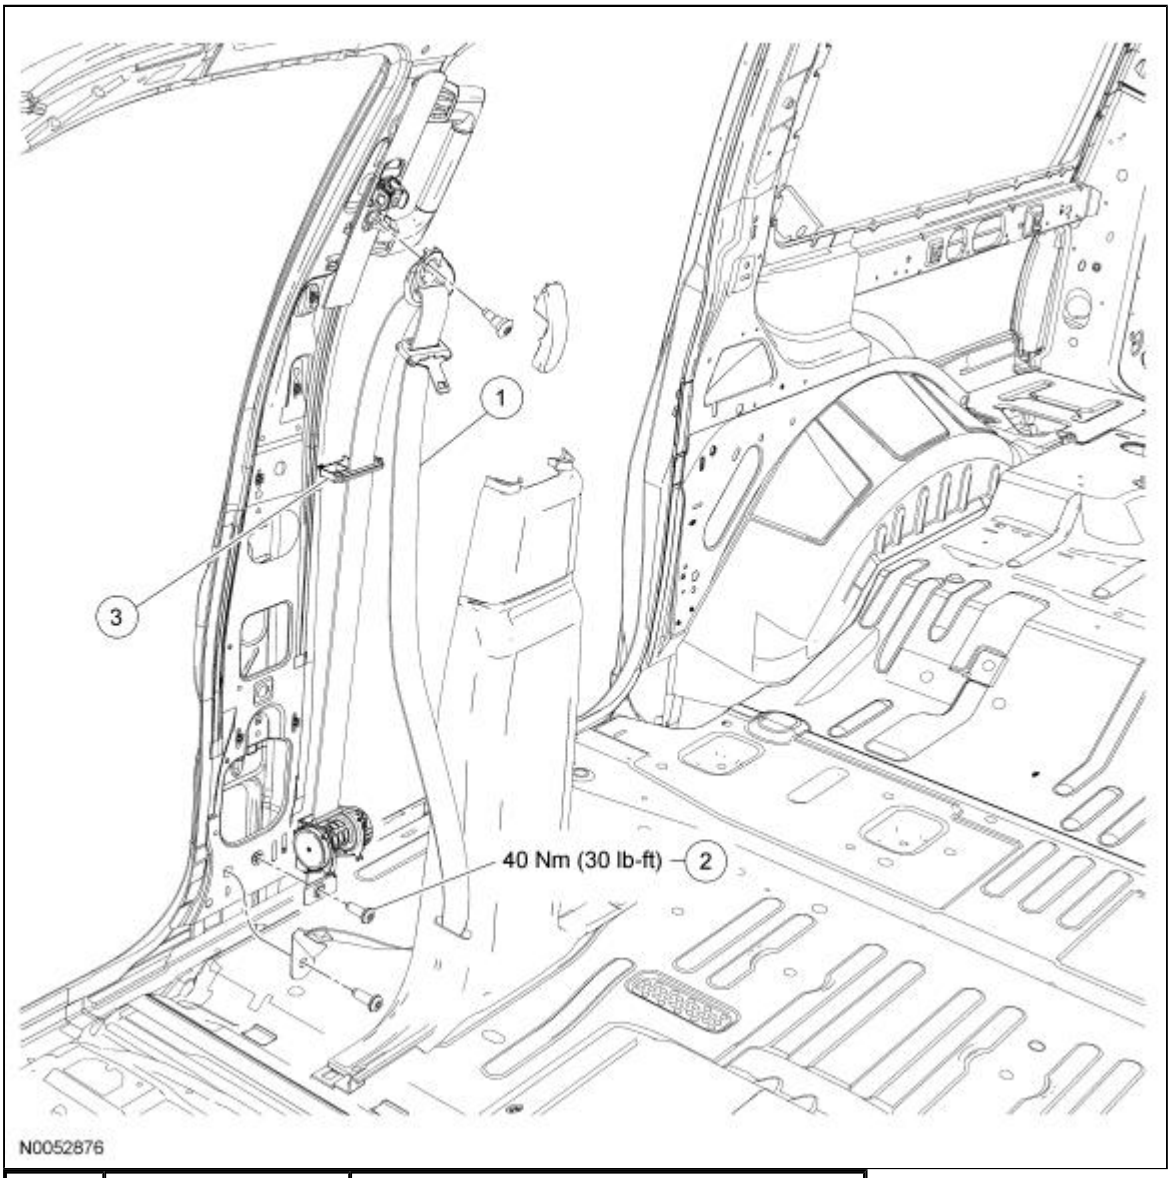


2. Pull the safety belt tongue over the fold in the safety belt.



Safety Belt Retractor — Front

Printable View (316 KB)



Item	Part Number	Description
1	611B08	Safety belt retractor assembly
2	—	Bolt, safety belt retractor
3	—	Safety belt guide

Removal and Installation

WARNING: All safety belt assemblies (including retractors, belt tension sensors [BTS] if equipped, buckles, shoulder belt height adjusters [if equipped], child safety seat tether attachments and attaching hardware) should be inspected after any collision. All new belt assemblies should be installed unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and new assemblies installed if either damage or incorrect operation is noted.

The automatic locking retractor (ALR) feature of the safety belt retractor must be checked by a qualified technician to verify that the ALR feature for a child safety seat is functioning correctly, in addition to other checks for correct safety belt system function. A new belt and retractor assembly must be installed if the safety belt assembly's ALR feature, or any other safety belt function, is not operating correctly when inspected according to the functional inspection procedures in the workshop manual. Failure to install a new belt and retractor assembly could increase the risk of injury in collisions.

NOTE: RH shown, LH similar.

1. **NOTE:** Inspect the D-ring cover for damage. If the cover is damaged or does not remain closed, install a new D-ring cover.

   Remove the upper and lower B-pillar trim panels. For additional information, refer to Section 501-05 .

2. Release the 2 pin-type retainers and safety belt guide.

3. Remove the bolt and safety belt retractor.
   - To install, tighten to 40 Nm (30 lb-ft).

4. **NOTE:** Make sure the safety belt webbing is not twisted prior to installation.

   NOTE: When installing the safety belt retractor, make sure to engage the anti-rotation tab to the sheet metal

   NOTE: Remove the shipping clip after safety belt retractor installation.

   To install, reverse the removal procedure.

5. Check the active restraint system for correct operation. For additional information, refer to Safety Belt System in this section.

Removal and Installation

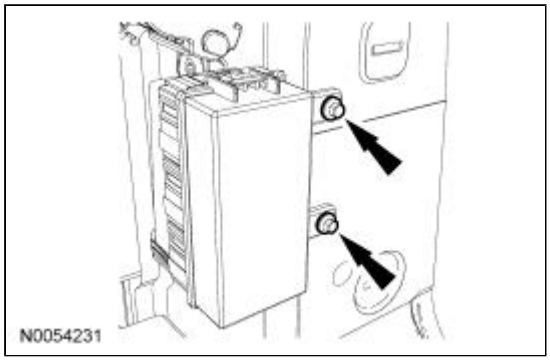
WARNING: All safety belt assemblies (including retractors, belt tension sensors [BTS] if equipped, buckles, shoulder belt height adjusters [if equipped], child safety seat tether attachments and attaching hardware) should be inspected after any collision. All new belt assemblies should be installed unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and new assemblies installed if either damage or incorrect operation is noted.

The automatic locking retractor (ALR) feature of the safety belt retractor must be checked by a qualified technician to verify that the ALR feature for a child safety seat is functioning correctly, in addition to other checks for correct safety belt system function. A new belt and retractor assembly must be installed if the safety belt assembly's ALR feature, or any other safety belt function, is not operating correctly when inspected according to the functional inspection procedures in the workshop manual. Failure to install a new belt and retractor assembly could increase the risk of injury in collisions.

NOTE: RH shown, LH similar.

Both retractors

1. Remove the rear quarter trim panel. For additional information, refer to Section 501-05 .
2. For RH 3rd row safety belt retractor, remove the 2 screws and position aside the auxiliary relay box, if equipped.



Second row retractor (Expedition/Navigator)

3. Remove the safety belt anchor bolt.
    - To install, tighten to 40 Nm (30 lb-ft).

4. **NOTE:** Inspect the D-ring cover for damage. If the cover is damaged or does not remain closed, install new D-ring cover and bolt.

   Open the D-ring cover and remove the D-ring bolt.
    - To install, tighten to 40 Nm (30 lb-ft).

5. Remove the bolt and safety belt retractor.
    - To install, tighten to 40 Nm (30 lb-ft).

Second row retractor (Expedition EL/Navigator L)

6. **NOTE:** Inspect the D-ring cover for damage. If the cover is damaged or does not remain closed, install new D-ring cover and bolt.

   Open the D-ring cover and remove the D-ring bolt.
    - To install, tighten to 40 Nm (30 lb-ft).

7. Remove the bolt and safety belt retractor.
    - To install, tighten to 40 Nm (30 lb-ft).

Third row retractor (Expedition/Navigator)

8. Open the D-ring cover and remove the D-ring bolt.
    - To install, tighten to 40 Nm (30 lb-ft).

9. Remove the bolt and safety belt retractor.
    - To install, tighten to 40 Nm (30 lb-ft).

Third row retractor (Expedition EL/Navigator L)

10. Remove the sling cover and bolt.
    - To install, tighten to 40 Nm (30 lb-ft).

11. Remove the bolt and safety belt retractor.
    - To install, tighten to 40 Nm (30 lb-ft).

Both retractors

12. **NOTE:** Make sure the safety belt webbing is not twisted prior to installation.

NOTE: Before installing the third row safety belt anchor, make sure the floor slotted plastic insert is still present. If it is not, another insert must be installed.

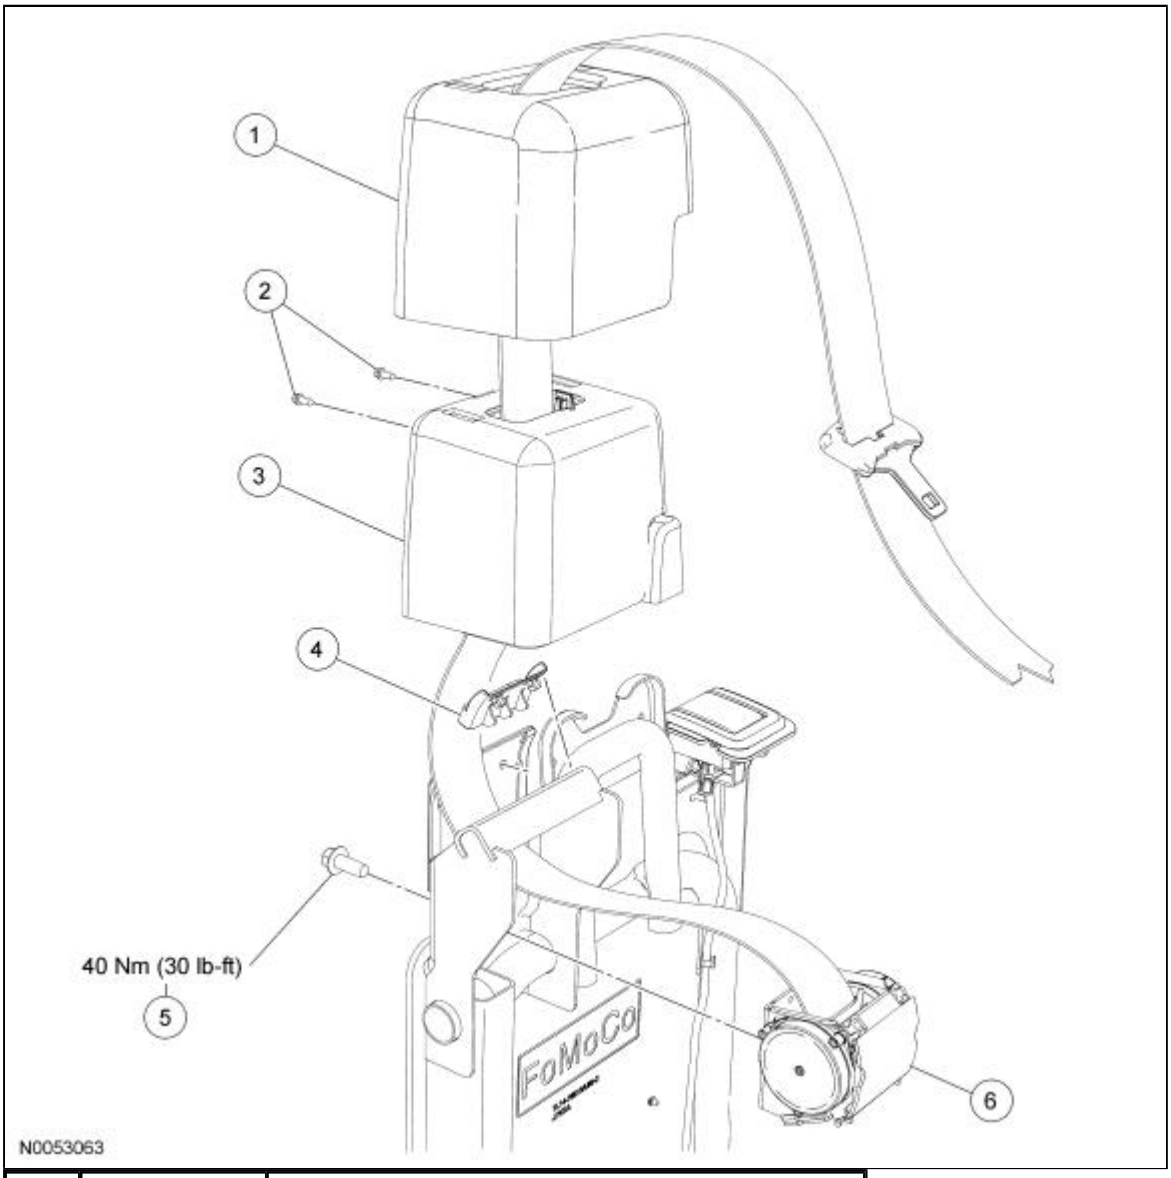
NOTE: When installing the safety belt retractor, make sure to engage the anti-rotation tab to the sheet metal.

To install, reverse the removal procedure.

13. Check the active restraint system for correct operation. For additional information, refer to Safety Belt System in this section.

Safety Belt Retractor — Second Row, Center

Printable View (187 KB)



Item	Part Number	Description
1	611D52	Foam, safety belt retractor cover
2	W504042	Screws, safety belt retractor cover (2 required)
3	613C46	Safety belt retractor cover
4	—	Safety belt retractor guide (part of 611B64)
5	W505274	Bolt, safety belt retractor
6	611B64	Safety belt retractor

Removal and Installation

WARNING: All safety belt assemblies (including retractors, belt tension sensors [BTS] if equipped, buckles, shoulder belt height adjusters [if equipped], child safety seat tether

attachments and attaching hardware) should be inspected after any collision. All new belt assemblies should be installed unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and new assemblies installed if either damage or incorrect operation is noted.

The automatic locking retractor (ALR) feature of the safety belt retractor must be checked by a qualified technician to verify that the ALR feature for a child safety seat is functioning correctly, in addition to other checks for correct safety belt system function. A new belt and retractor assembly must be installed if the safety belt assembly's ALR feature, or any other safety belt function, is not operating correctly when inspected according to the functional inspection procedures in the workshop manual. Failure to install a new belt and retractor assembly could increase the risk of injury in collisions.

NOTE: The retractor may be equipped with an additional web stop button (small, thin, round button, not to be confused with the larger web stop button) located on the safety belt webbing. This button is only used for vehicle assembly and serves no other functional purpose. The button can possibly be retracted under the trim bezel making it difficult to pull the safety belt webbing out of the retractor. To service, remove this web stop button. Do not install a new safety belt retractor to eliminate this condition. Any resulting appearance concerns with the webbing can be worked out by hand. For additional information, refer to Safety Belt System in this section.

1. Remove the second row 20 percent seat backrest trim cover. For additional information, refer to Section 501-10 .

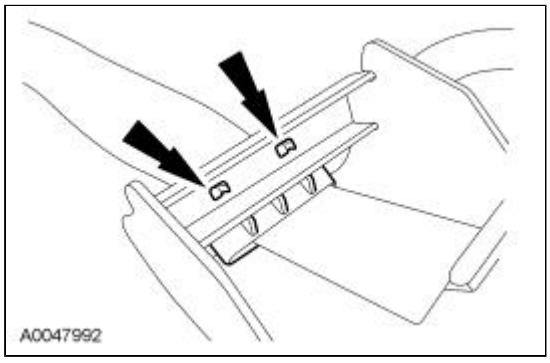
2. Remove the seat backrest foam pad.

3. Remove the safety belt retractor cover foam.

4. Remove the 2 screws from the seat belt retractor cover and remove the cover.

5. Remove the safety belt retractor bolt.
   - To install, tighten to 40 Nm (30 lb-ft).

6. Pinch and release the safety belt retractor guide from the seat backrest frame and remove the safety belt retractor.



7. **NOTE:** Make sure the safety belt webbing is not twisted prior to installation.

   NOTE: When installing the safety belt retractor, make sure to engage the anti-rotation tab to the sheet metal.

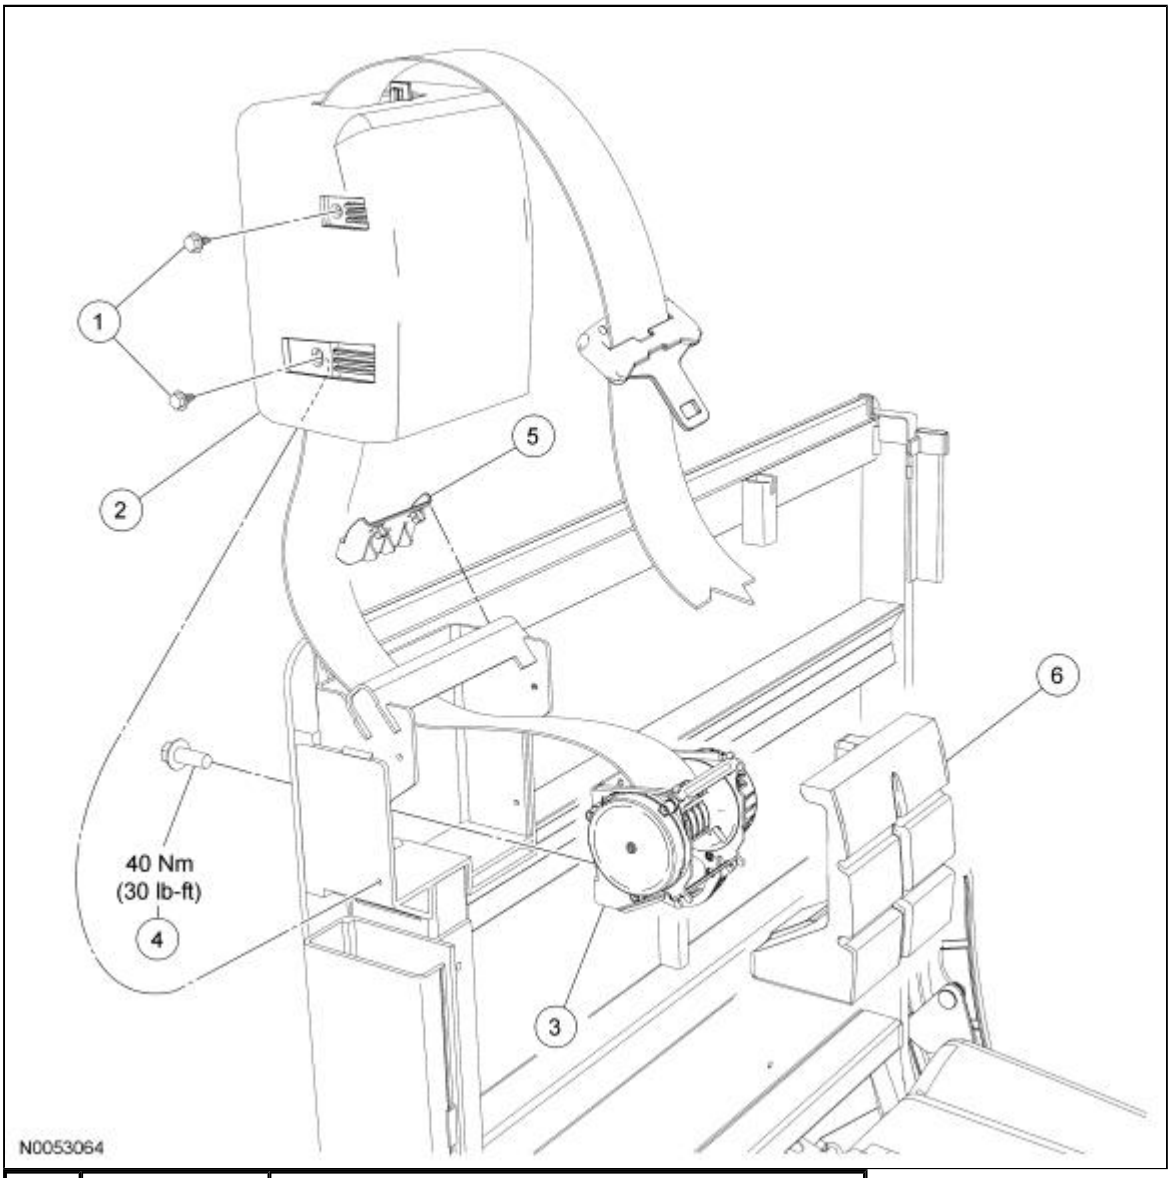
   NOTE: Remove the shipping clip after safety belt retractor installation.

   To install, reverse the removal procedure.

8. Check the active restraint system for correct operation. For additional information, refer to Safety Belt System in this section.

Safety Belt Retractor — Third Row, Center

Printable View (217 KB)



Item	Part Number	Description
1	W708687	Screw, safety belt retractor cover (4 required)
2	613C46	Safety belt retractor cover
3	611B64	Safety belt retractor
4	—	Bolt, safety belt retractor (part of 611B64)
5	—	Safety belt retractor guide (part of 611B64)
6	—	Safety belt retractor insulator (part of 611B64)

Removal and Installation

WARNING: All safety belt assemblies (including retractors, belt tension sensors [BTS] if equipped, buckles, shoulder belt height adjusters [if equipped], child safety seat tether

attachments and attaching hardware) should be inspected after any collision. All new belt assemblies should be installed unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and new assemblies installed if either damage or incorrect operation is noted.

The automatic locking retractor (ALR) feature of the safety belt retractor must be checked by a qualified technician to verify that the ALR feature for a child safety seat is functioning correctly, in addition to other checks for correct safety belt system function. A new belt and retractor assembly must be installed if the safety belt assembly's ALR feature, or any other safety belt function, is not operating correctly when inspected according to the functional inspection procedures in the workshop manual. Failure to install a new belt and retractor assembly could increase the risk of injury in collisions.

NOTE: The retractor may be equipped with an additional web stop button (small, thin, round button, not to be confused with the larger web stop button) located on the safety belt webbing. This button is only used for vehicle assembly and serves no other functional purpose. The button can possibly be retracted under the trim bezel making it difficult to pull the safety belt webbing out of the retractor. To service, remove this web stop button. Do not install a new safety belt retractor to eliminate this condition. Any resulting appearance concerns with the webbing can be worked out by hand.

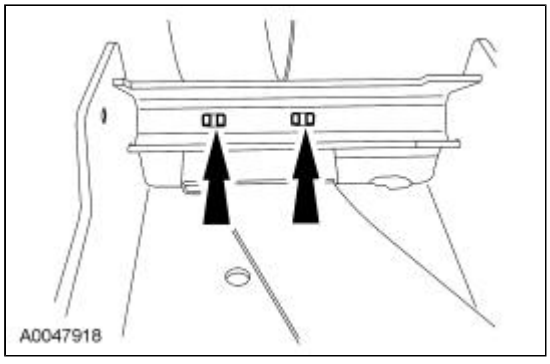
1. Remove the third row 60 percent seat backrest trim cover. For additional information, refer to Section 501-10 .

2. Remove the seat backrest foam pad.

3. Remove the 4 screws from the seat belt retractor cover (2 shown).

4. Remove the safety belt retractor bolt.
   - To install, tighten to 40 Nm (30 lb-ft).

5. Pinch to release the safety belt retractor guide and remove the safety belt retractor.



6. **NOTE:** Make sure the safety belt webbing is not twisted prior to installation.

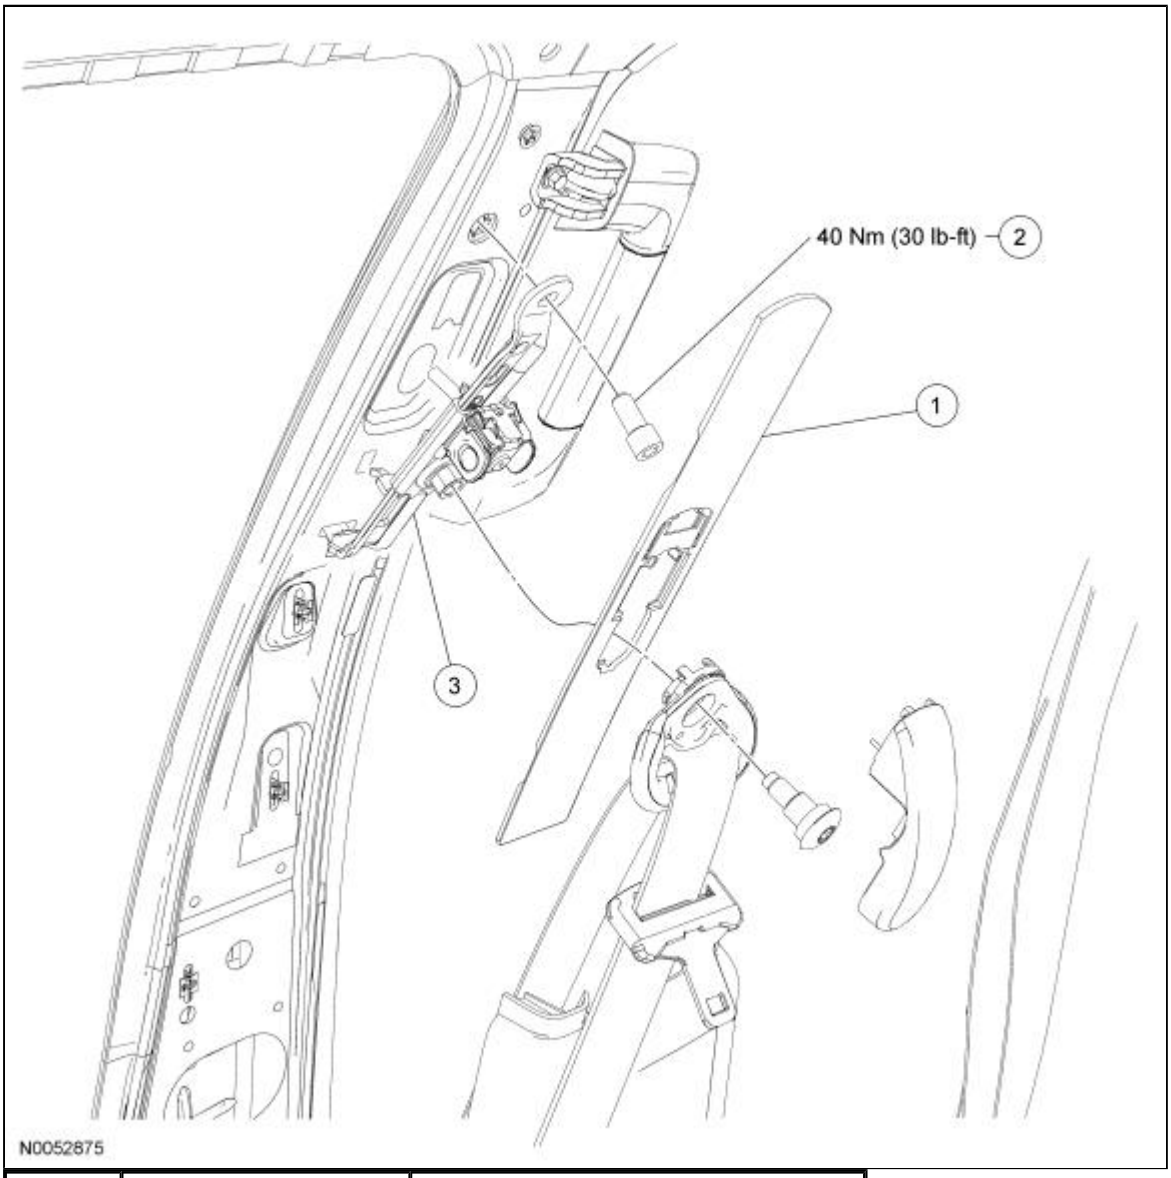
   NOTE: Remove the shipping clip after safety belt retractor installation.

   To install, reverse the removal procedure.

7. Check the active restraint system for correct operation. For additional information, refer to Safety Belt System in this section.

Safety Belt Shoulder Height Adjuster

Printable View (242 KB)



Item	Part Number	Description
1	602B90	Cover, height adjuster
2	—	Bolt, height adjuster
3	602B82	Height adjuster

Removal and Installation

WARNING: All safety belt assemblies (including retractors, belt tension sensors [BTS] if equipped, buckles, shoulder belt height adjusters [if equipped], child safety seat tether attachments and attaching hardware) should be inspected after any collision. All new belt assemblies should be installed unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and new assemblies installed if either damage or incorrect operation is noted.

The automatic locking retractor (ALR) feature of the safety belt retractor must be checked by a qualified technician to verify that the ALR feature for a child safety seat is functioning correctly, in addition to other checks for correct safety belt system function. A new belt and retractor assembly must be installed if the safety belt assembly's ALR feature, or any other safety belt function, is not operating correctly when inspected according to the functional inspection procedures in the workshop manual. Failure to install a new belt and retractor assembly could increase the risk of injury in collisions.

NOTE: RH shown, LH similar.

1. **NOTE:** Inspect the D-ring cover for damage. If the cover is damaged or does not remain closed, install new D-ring cover and bolt.

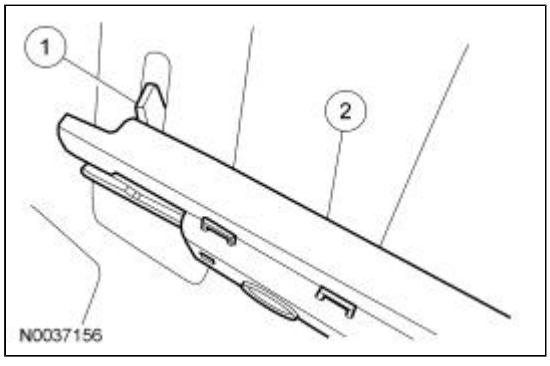
   Position the safety belt guide to the lowest position.

   Remove the upper B-pillar trim panel. For additional information, refer to Section 501-05 .

2. Access the bolt behind the safety belt shoulder height adjuster trim cover.

3. Remove the safety belt shoulder height adjuster bolt.
   - To install, tighten to 40 Nm (30 lb-ft).

4. Remove the safety belt shoulder height adjuster.
   1. Rotate the safety belt shoulder height adjuster downward to release the lower tab.
   2. Remove the safety belt shoulder height adjuster.



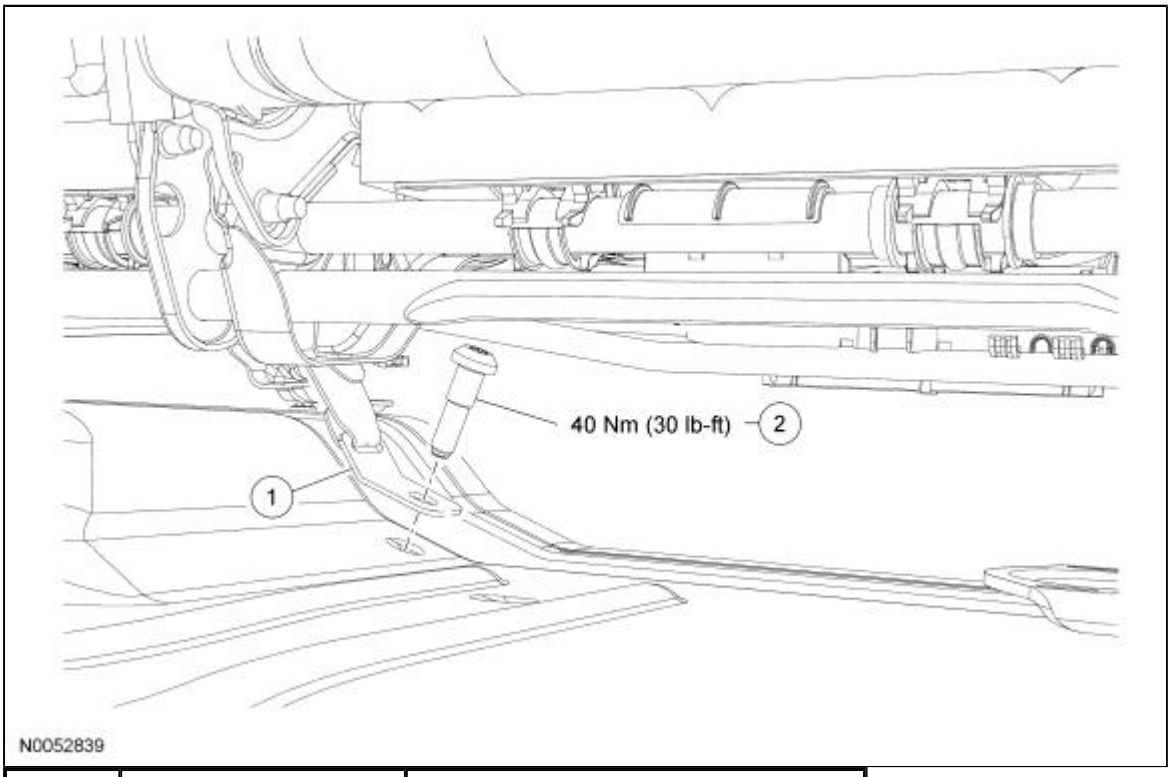
5. **NOTE:** Make sure the safety belt webbing is not twisted prior to installation.

   To install, reverse the removal procedure.

6. Check the active restraint system for correct operation. For additional information, refer to Safety Belt System in this section.

Safety Belt Buckle — Front, Center

Printable View (159 KB)



Item	Part Number	Description
1	611B60	Safety belt buckle
2	N811712	Bolt, safety belt buckle

Removal and Installation

WARNING: All safety belt assemblies (including retractors, belt tension sensor [BTS], if equipped, buckles, shoulder belt height adjusters [if equipped], child safety seat tether attachments and attaching hardware) should be inspected after every collision. All new belt assemblies should be installed unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and new assemblies installed if either damage or incorrect operation is noted. Failure to follow these instructions could increase the risk of injury in collisions.

1. Move the seat to the most forward position.

2. Remove the bolt and route the safety belt buckle out of the seat.
   - To install, tighten to 40 Nm (30 lb-ft).

3. **NOTE:** Make sure the safety belt webbing is not twisted prior to installation.

   NOTE: Make sure the safety belt buckle is accessible to the occupant after installation.

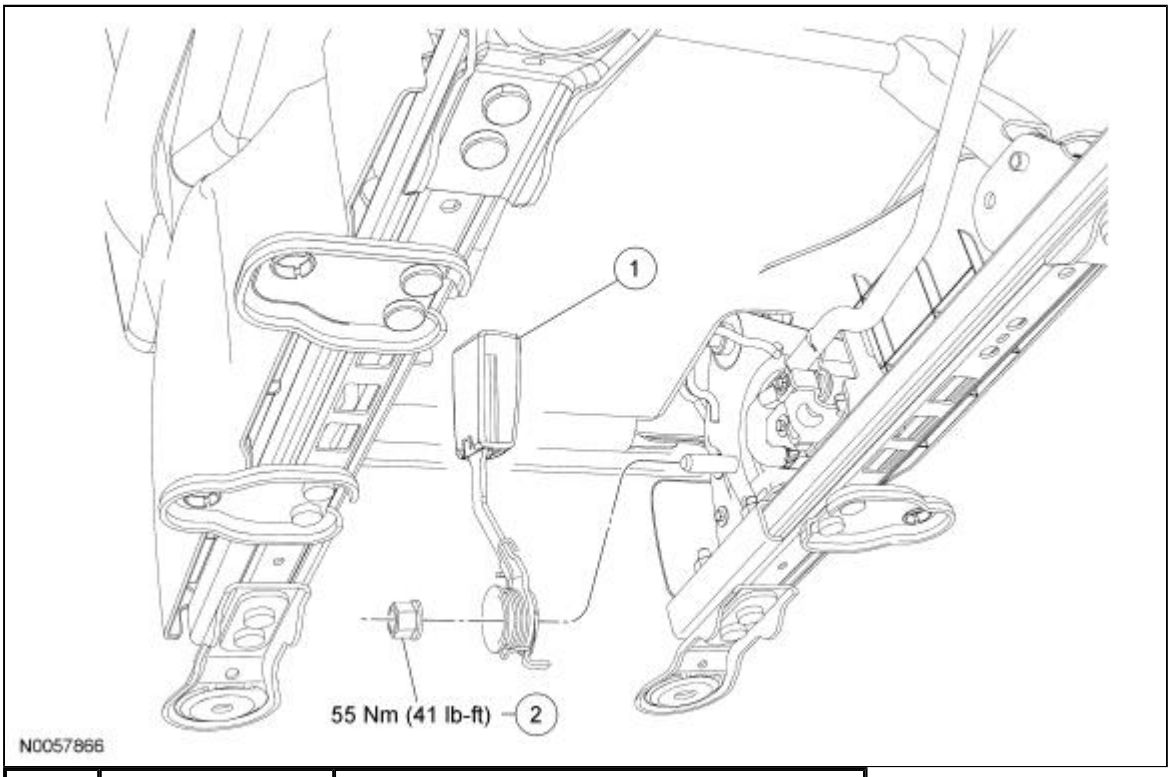
   To install, reverse the removal procedure.

4. Check the active restraint system for correct operation. For additional information, refer to Safety

Belt System in this section.

Safety Belt Buckle — Second Row, 20 Percent Seat

Printable View (200 KB)



Item	Part Number	Description
1	60044	Safety belt buckle assembly
2	N620483	Nut, safety belt buckle assembly

Removal and Installation

WARNING: All safety belt assemblies (including retractors, belt tension sensor [BTS], if equipped, buckles, shoulder belt height adjusters [if equipped], child safety seat tether attachments and attaching hardware) should be inspected after every collision. All new belt assemblies should be installed unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and new assemblies installed if either damage or incorrect operation is noted. Failure to follow these instructions could increase the risk of injury in collisions.

1. Position the seat upright.

2. Remove the nut and safety belt buckle assembly from underneath the seat.
   - To install, tighten to 55 Nm (41 lb-ft).

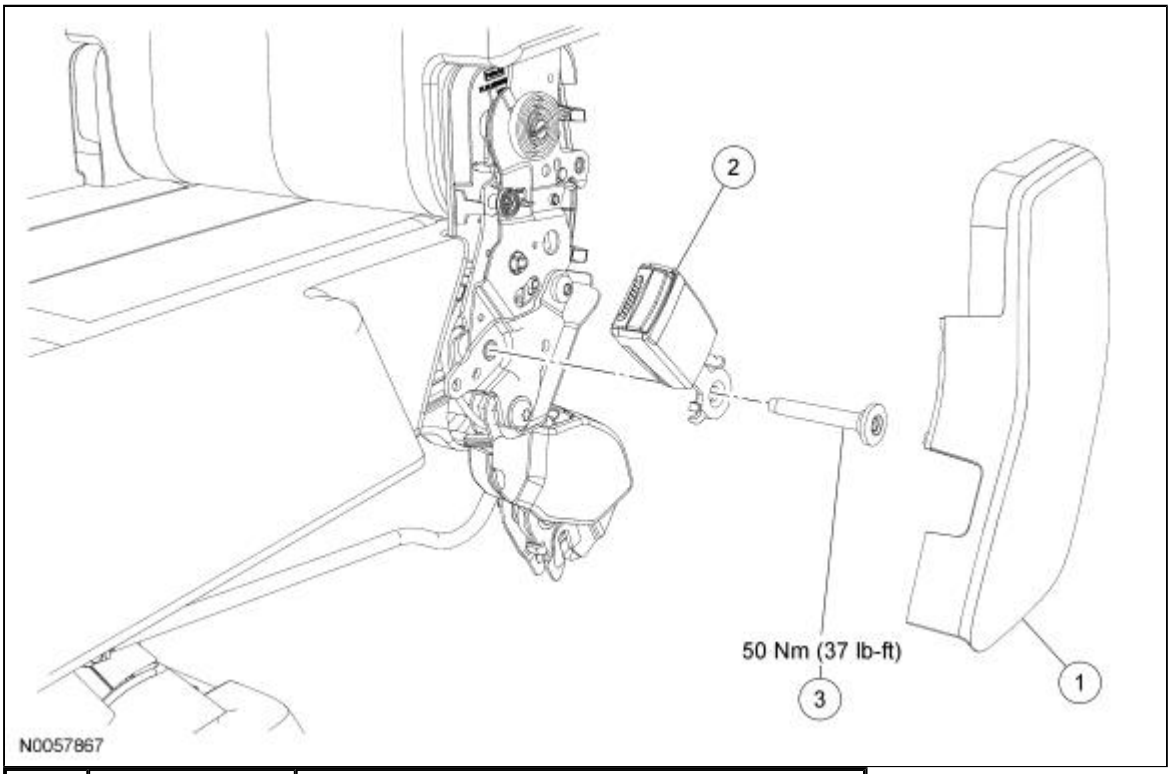
3. **NOTE:** When installing the safety belt buckle, make sure to engage the anti-rotation tab to the seat frame.

   To install, reverse the removal procedure.

4. Check the active restraint system for correct operation. For additional information, refer to Safety Belt System in this section.

Safety Belt Buckle — Second Row, 40 Percent Seat

Printable View (160 KB)



Item	Part Number	Description
1	666L76	Side shield
2	613D98	Safety belt buckle
3	—	Bolt, safety belt buckle (part of 613D98)

Removal and Installation

WARNING: All safety belt assemblies (including retractors, belt tension sensor [BTS], if equipped, buckles, shoulder belt height adjusters [if equipped], child safety seat tether attachments and attaching hardware) should be inspected after every collision. All new belt assemblies should be installed unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and new assemblies installed if either damage or incorrect operation is noted. Failure to follow these instructions could increase the risk of injury in collisions.

NOTE: RH 40 percent seat shown, LH similar.

1. Pivot the 40 percent seat upward.

2. Remove the rearward screw (not shown) and seat side shield.
   - Release the pin-type retainer (not shown).

3. Remove the bolt and the safety belt buckle.
   - To install, tighten to 50 Nm (37 lb-ft).

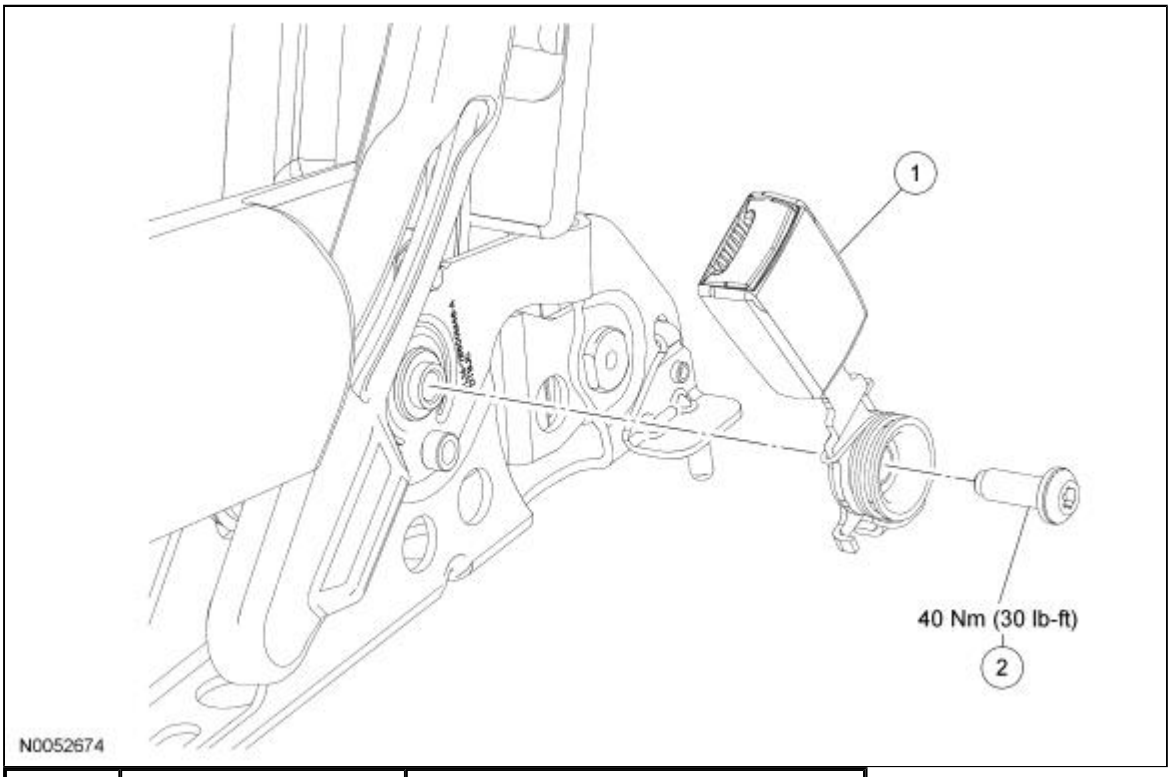
4. **NOTE:** When installing the safety belt buckle, make sure to engage the anti-rotation tab to the seat frame.

   To install, reverse the removal procedure.

5. Check the active restraint system for correct operation. For additional information, refer to Safety Belt System in this section.

Safety Belt Buckle — Third Row, 40 Percent Seat

Printable View (158 KB)



Item	Part Number	Description
1	60044	Safety belt buckle
2	N807750	Bolt, safety belt buckle

Removal and Installation

WARNING: All safety belt assemblies (including retractors, belt tension sensor [BTS], if equipped, buckles, shoulder belt height adjusters [if equipped], child safety seat tether attachments and attaching hardware) should be inspected after every collision. All new belt assemblies should be installed unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and new assemblies installed if either damage or incorrect operation is noted. Failure to follow these instructions could increase the risk of injury in collisions.

1. Remove the third row 40 percent seat. For additional information, refer to Section 501-10 .

2. Remove the bolt and the safety belt buckle.
   - To install, tighten to 40 Nm (30 lb-ft).

3. **NOTE:** When installing the safety belt buckle, make sure to engage the anti-rotation tab to the sheet metal.

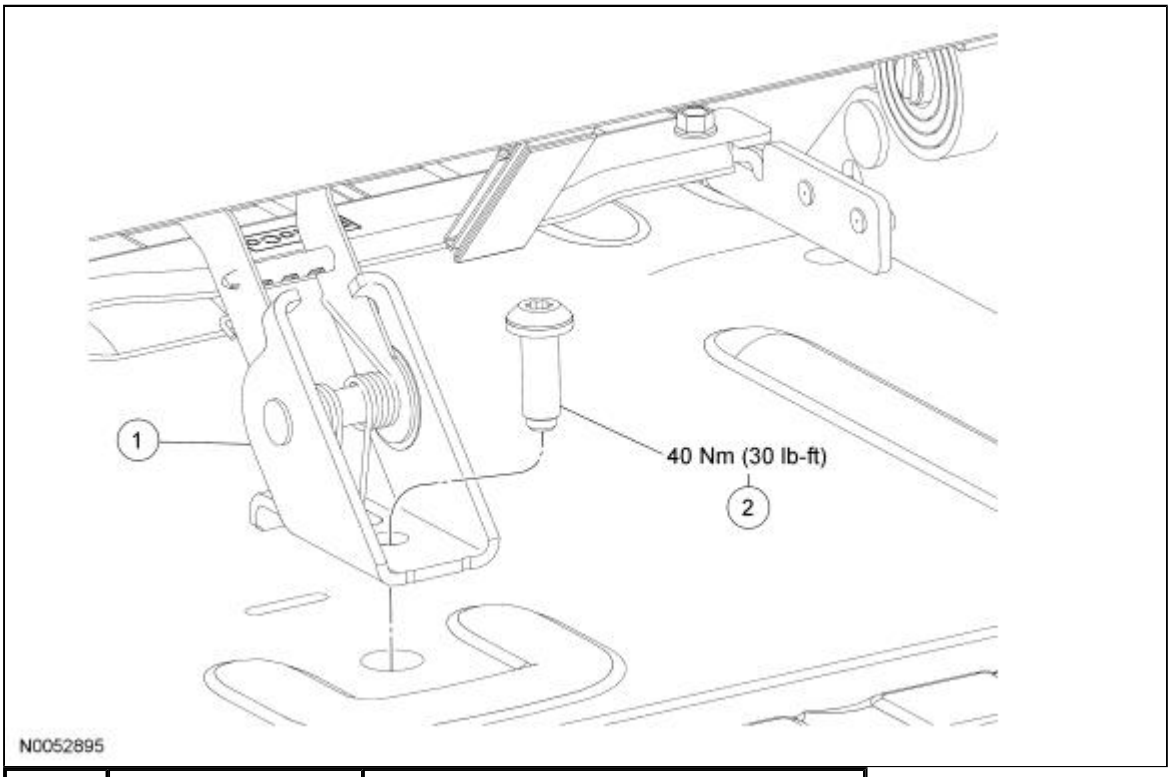
   NOTE: Make sure the safety belt buckle is accessible to the passenger after installation.

   To install, reverse the removal procedure.

4. Check the active restraint system for correct operation. For additional information, refer to Safety Belt System in this section.

Safety Belt Buckle — Third Row, 60 Percent Seat

Printable View (146 KB)



Item	Part Number	Description
1	60044	Safety belt buckle assembly
2	N807750	Bolt, safety belt buckle

Removal and Installation

WARNING: All safety belt assemblies (including retractors, belt tension sensor [BTS], if equipped, buckles, shoulder belt height adjusters [if equipped], child safety seat tether attachments and attaching hardware) should be inspected after every collision. All new belt assemblies should be installed unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and new assemblies installed if either damage or incorrect operation is noted. Failure to follow these instructions could increase the risk of injury in collisions.

1. Fold the 60 percent seat down.
2. Position the load floor panels up.
3. Remove the bolt and safety belt buckle assembly.
   - To install, tighten to 40 Nm (30 lb-ft).
4. Fold the 60 percent seat up and remove the safety belt buckle assembly through the seat.
5. **NOTE:** When installing the safety belt buckle assembly, make sure to engage the anti-rotation tab to the sheet metal.

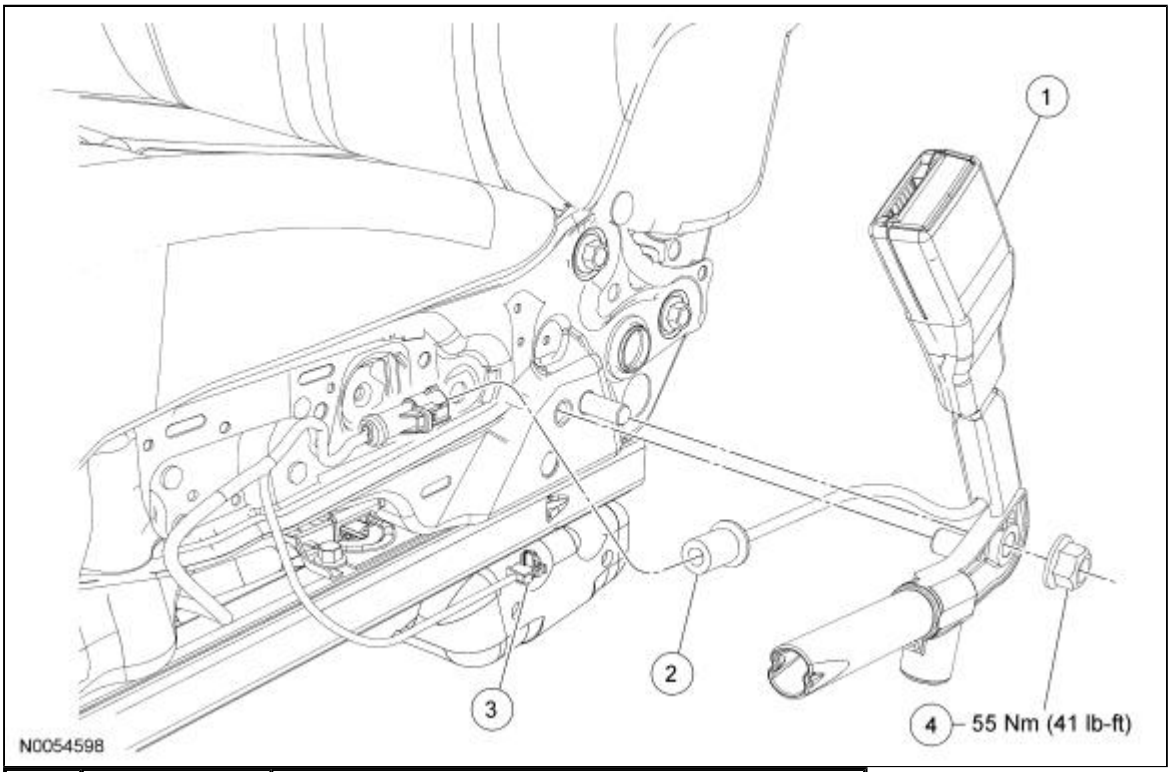
NOTE: Make sure the safety belt buckles are accessible to the passengers after installation.

To install, reverse the removal procedure.

6. Check the active restraint system for correct operation. For additional information, refer to Safety Belt System in this section.

Safety Belt Buckle and Pretensioner — 40 Percent

Printable View (215 KB)



Item	Part Number	Description
1	61202	Safety belt buckle pretensioner assembly
2	—	Electrical connector, safety belt buckle switch
3	—	Electrical connector, safety belt pretensioner
4	W800937	Nut, safety belt buckle pretensioner

Removal and Installation

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

WARNING: All safety belt assemblies (including retractors, belt tension sensor [BTS] if equipped, buckles, shoulder belt height adjusters [if equipped], child safety seat tether attachments and attaching hardware) should be inspected after every collision. All new belt assemblies should be installed unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and new assemblies installed if either damage or incorrect operation is noted. Failure to follow these instructions could increase the risk of injury in collisions.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

NOTE: If a seat equipped with a supplemental restraint system (SRS) component is being serviced, the SRS must be depowered.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

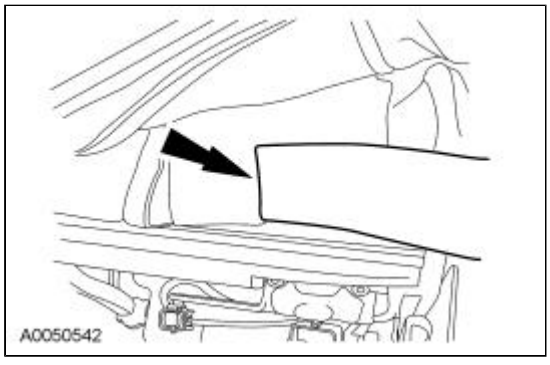
NOTE: LH shown, RH similar.

1. Position the seat to gain access to all seat fasteners.

2. Depower the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

3. Remove the 40 percent front seat. For additional information, refer to Section 501-10 .

4. Release the hook-and-loop strip and pull the seat cushion trim cover up enough to expose the safety belt buckle and pretensioner.



5. **NOTE:** Make note of the wire harness routing for installation.

   Remove the tie strap from the pretensioner.
   - Disconnect the safety belt buckle switch electrical connector.
   - Disconnect the safety belt buckle pretensioner electrical connector.

6. Remove the nut and safety belt buckle and pretensioner.
   - To install, tighten to 55 Nm (41 lb-ft).

7. To install, reverse the removal procedure.

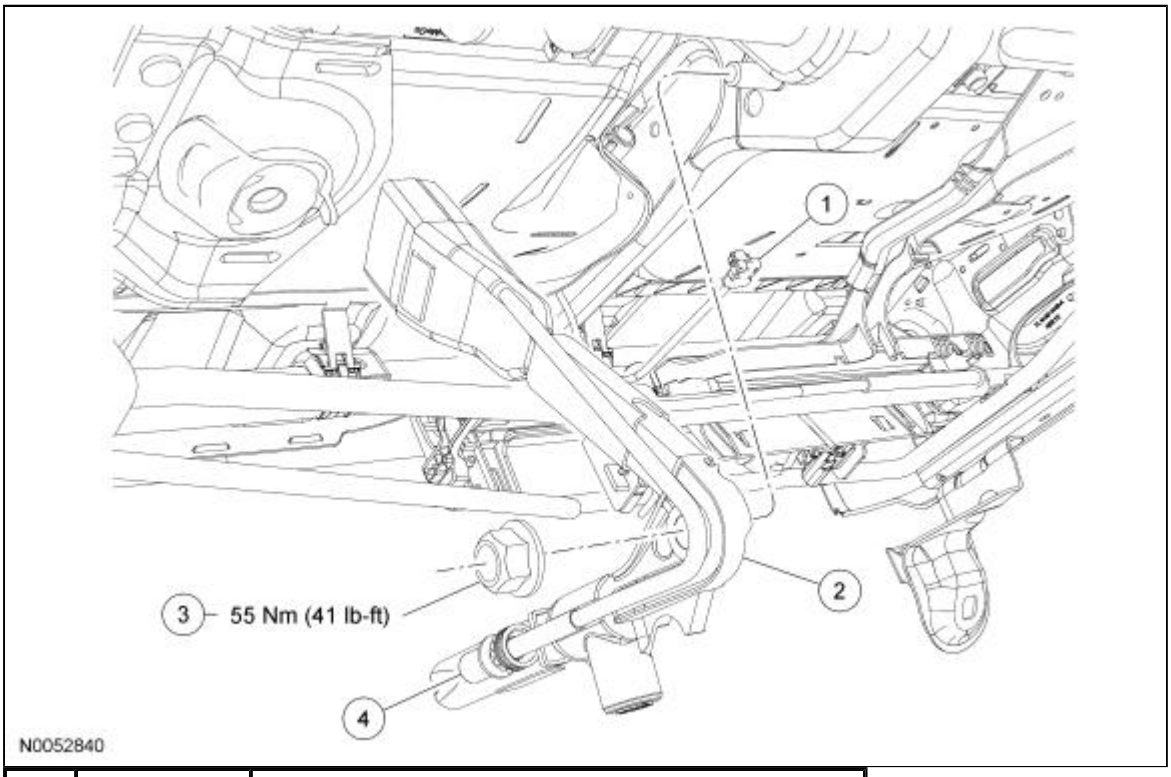
8. Install the 40 percent front seat. For additional information, refer to Section 501-10 .

9. Repower the SRS. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

10. Check the active restraint system for correct operation. For additional information, refer to Safety Belt System in the Diagnosis and Testing portion of this section.

Safety Belt Buckle and Pretensioner — 60 Percent

Printable View (216 KB)



Item	Part Number	Description
1	—	Electrical connector, safety belt buckle pretensioner
2	61202	Safety belt buckle pretensioner assembly
3	W800937	Nut, safety belt buckle pretensioner
4	—	Electrical connector, safety belt buckle switch

Removal

WARNING: All safety belt assemblies (including retractors, belt tension sensor [BTS], if equipped, buckles, shoulder belt height adjusters [if equipped], child safety seat tether attachments and attaching hardware) should be inspected after every collision. All new belt assemblies should be installed unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and new assemblies installed if either damage or incorrect operation is noted. Failure to follow these instructions could increase the risk of injury in collisions.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: If a seat equipped with a supplemental restraint system (SRS) component is being serviced, the SRS must be depowered.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Position the seat to gain access to all seat fasteners.

2. Depower the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

3. Remove the 60 percent front seat. For additional information, refer to Section 501-10 .

4. **NOTE:** Make note of the wire harness routing for installation.

   Remove the tie strap from the pretensioner.
   - Disconnect the safety belt buckle switch electrical connector.
   - Disconnect the safety belt buckle pretensioner electrical connector.

5. Remove the nut and safety belt buckle pretensioner assembly.

Installation

1. Install the safety belt buckle and pretensioner.
   1. Position the safety belt buckle and pretensioner to the seat.
      - Align the safety belt buckle and pretensioner locator tab to the hole in the seat frame.
      - Check that the safety belt buckle end is accessible after positioning.
   2. Install the nut.
      - Tighten to 55 Nm (41 lb-ft).
   3. Route the safety belt buckle switch and pretensioner electrical connectors as noted in removal.

2. Connect the electrical connectors. Attach the electrical connectors and route the wire harnesses as noted in removal.

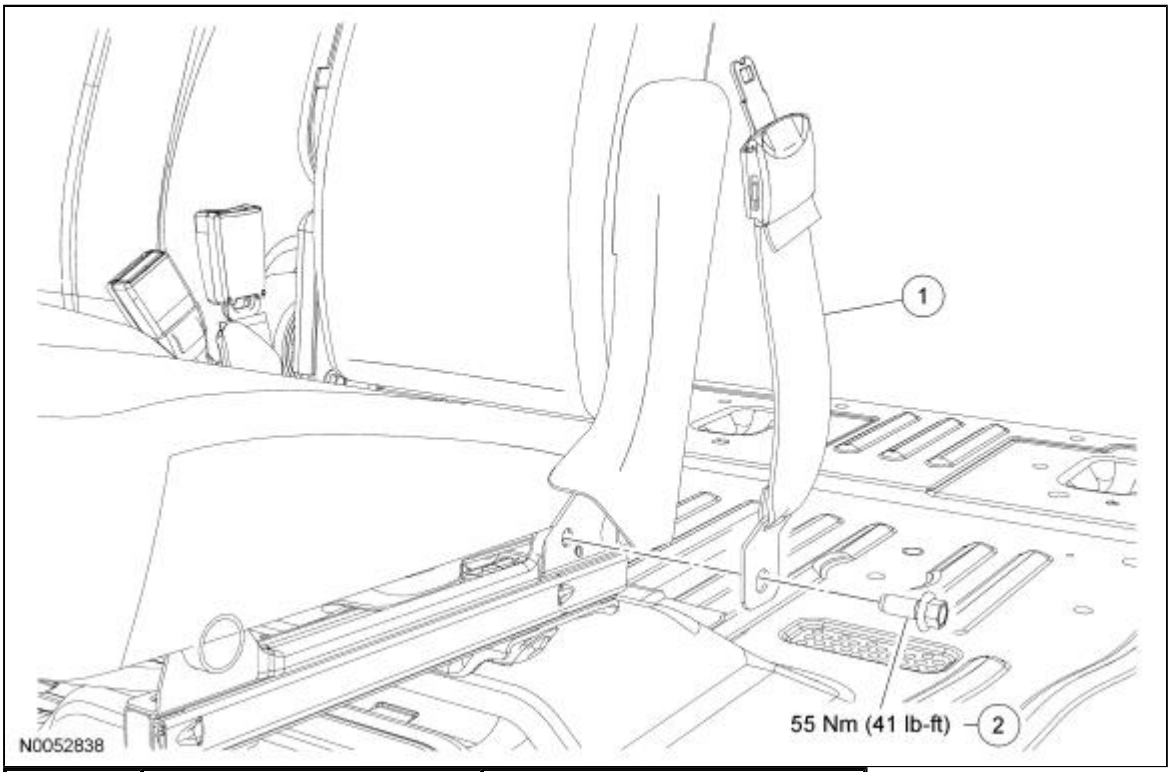
3. Install the 60 percent front seat. For additional information, refer to Section 501-10 .

4. Repower the SRS. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

5. Check the active restraint system for correct operation. For additional information, refer to Safety Belt System in the Diagnosis and Testing portion of this section.

Safety Belt — Front, Center

Printable View (176 KB)



Item	Part Number	Description
1	611B60	Safety belt
2	W710482	Bolt, safety belt

Removal and Installation

WARNING: All safety belt assemblies (including retractors, belt tension sensor [BTS], if equipped, buckles, shoulder belt height adjusters [if equipped], child safety seat tether attachments and attaching hardware) should be inspected after every collision. All new belt assemblies should be installed unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and new assemblies installed if either damage or incorrect operation is noted. Failure to follow these instructions could increase the risk of injury in collisions.

1. Move the driver seat to the most forward position.
2. Move the passenger seat to the most rearward position.
3. Remove the bolt and route the safety belt out from the seat.
   - To install, tighten to 55 Nm (41 lb-ft).
4. **NOTE:** Make sure the safety belt webbing is not twisted prior to installation.

   NOTE: When installing, make sure the safety belt anchor is on top of the seat bracket.

   NOTE: Make sure the safety belt is accessible to the occupant after installation.

To install, reverse the removal procedure.

5. Check the active restraint system for correct operation. For additional information, refer to Safety Belt System in this section.

Child Safety Seat Tether Anchor

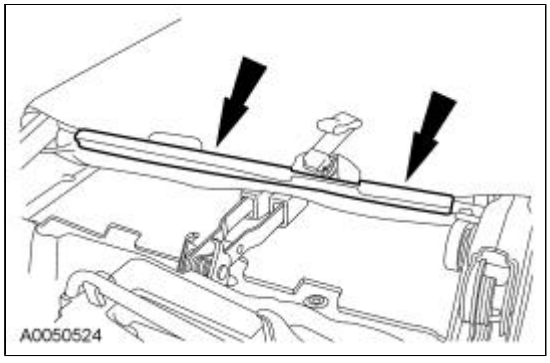
Printable View (122 KB)

Removal and Installation

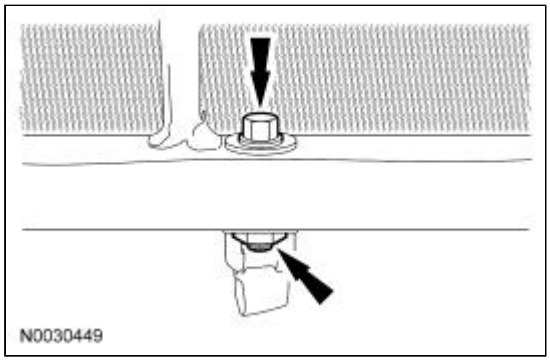
WARNING: All safety belt assemblies (including retractors, belt tension sensor [BTS], if equipped, buckles, shoulder belt height adjusters [if equipped], child safety seat tether attachments and attaching hardware) should be inspected after every collision. All new belt assemblies should be installed unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and new assemblies installed if either damage or incorrect operation is noted. Failure to follow these instructions could increase the risk of injury in collisions.

1. Position the third row seat backrest downward.

2. Release the seat back J-clips.



3. With the seat backrest trim cover and cushion positioned aside, remove the nut, bolt and the tether anchor.
   - To install, tighten to 15 Nm (11 lb-ft).



4. **WARNING: It is important that the bolt/anchor be securely tightened to specification. Otherwise, the child's safety seat may not be correctly secured and the child could be injured in case of a sudden stop or accident.**

   NOTE: Inspect the seat for damage. If the seat is found to be damaged, install new seat components.

   To install, reverse the removal procedure.

5. Check the active restraint system for correct operation. For additional information, refer to Safety Belt System in this section.

Printable View (65 KB)

Torque Specifications

Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)

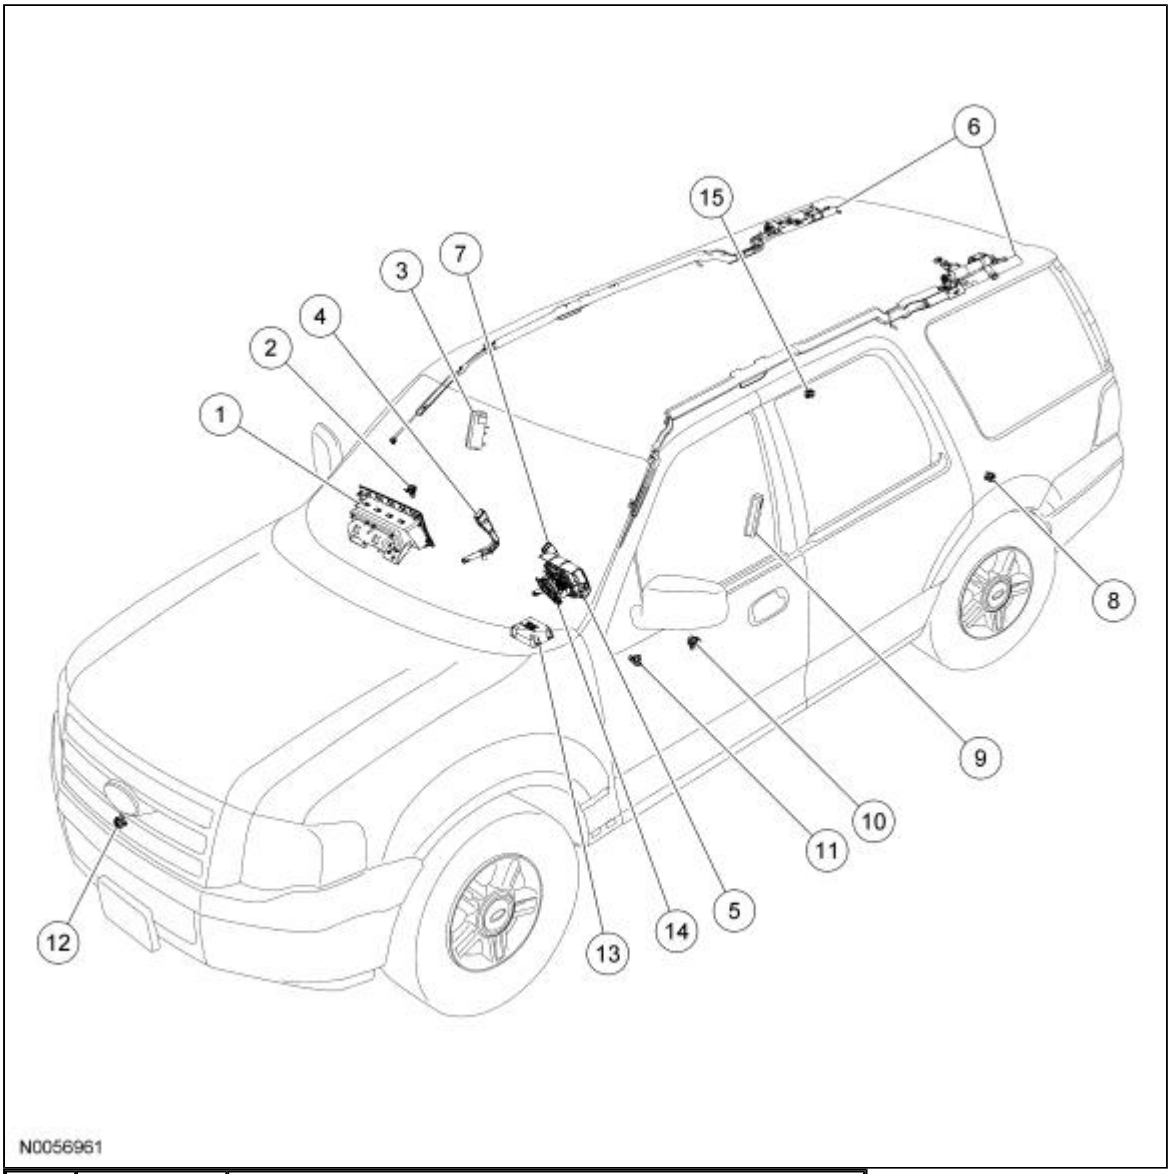
Printable View (206 KB)

The air bag supplemental restraint system (SRS) is designed to provide increased collision protection for front seat and second row outboard occupants in addition to that provided by the 3-point safety belt system. Safety belt use is necessary to obtain the best occupant protection and to receive the full advantage of the SRS.

This vehicle line contains dual stage deployment (advanced restraint system) driver and front passenger air bag modules. These vehicles are also equipped with safety canopies that deploy from the A-pillar to the D-pillar upon a side impact or if a rollover condition is detected. Vehicles are also equipped with seat side air bag modules in the front seats. These vehicles are also equipped with driver and front passenger safety belt buckle pretensioners.

Seat side air bag modules deploy from the outboard front seat backrest upon a side impact. In addition, a front impact severity sensor is mounted to the lower radiator support and there are an additional 4 side impact sensors. A seat position sensor is mounted to the driver seat and a usage detection switch is added to the front driver and passenger outboard buckles.

Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) Components



Item	Part Number	Description
1	044A74	Passenger air bag module
2	14B345	First row, passenger door, side impact (pressure) sensor
3	611D10	Passenger side air bag module
4	61202	Passenger safety belt buckle and pretensioner (includes safety belt buckle switch)
5	043B13	Driver air bag module
6	042D95	Driver side safety canopy module
6	042D94	Passenger side safety canopy module
7	61203	Driver safety belt buckle and pretensioner (includes safety belt buckle switch)
8	14B345	Driver side second row, C-pillar side impact sensor
9	611D10	Driver side air bag module
10	14B345	First row, driver door, side impact (pressure) sensor
11	14B416	Driver seat track position sensor

12	14B004	Front impact severity sensor
13	14B321	Restraints control module (RCM)
14	14A664	Clockspring
15	14B345	Passenger side second row, C-pillar side impact sensor (if equipped)

Clockspring

The clockspring:

- is mounted on the steering column, behind the steering wheel.
- allows for continuous electrical connections between the driver air bag module and the restraints control module (RCM) when the steering wheel is turned.

Driver Air Bag Module

The driver air bag module:

- is installed new as an assembly.
- is mounted in the center of the steering wheel.
- cannot be interchanged between Expedition and Navigator vehicles.

Side Air Bag Module

NOTE: References to side air bag modules refer to the seat-mounted, not to the steering wheel or instrument panel mounted air bag components of the SRS.

NOTE: When servicing a seat equipped with a side air bag module, refer to Section 501-10 .

A side air bag module provides protection of the thorax area (between the neck and abdomen) of the body, working in conjunction with the head protection provided by a safety canopy module.

The side air bag module:

- will deploy upon receiving a flow of current from the RCM, initiated by the side impact sensor and internal RCM circuitry.
- is installed as an assembly.
- is mounted in the driver or passenger seat backrest.
- is used in conjunction with a safety canopy module.

High Speed Controller Area Network (HS-CAN)

This vehicle utilizes a communication system called a high-speed controller area network (HS-CAN). The HS-CAN consists of a twisted pair of wires connected to the following:

- Anti-lock brake system (ABS) module
- Instrument cluster module

- Powertrain control module (PCM)
- Transmission control module (TCM)
- Four wheel drive (4WD) control module (if equipped)
- Restraints control module (RCM)
- Air suspension (vehicle dynamics) module (VDM) (if equipped)
- Data link connector (DLC)

The HS-CAN circuits use a bias voltage of approximately 2.5 volts, one is a positive 2.5 volts while the other is a negative 2.5 volts. The HS-CAN also uses 2 terminating resistors, one contained within the PCM, the other in the instrument cluster module. The terminating resistors are not serviced separately. The terminating resistors have a value of 120 ohms each, for a normal operating system total of 60 ohms. The HS-CAN will operate with only one terminating resistor and has the capability to communicate some messages to some of the control modules with only one circuit functioning, but at a reduced rate of performance. For additional information regarding HS-CAN, refer to Section 418-00 .

Loops/Squib

All deployable devices contain an initiating device called a squib. The squib is part of the deployment loop. Air bag/safety canopy modules can contain more than one squib, some vehicles may have up to 4 squibs in one air bag module. Squibs are often referred to as loops during the diagnostic process.

Passenger Air Bag Module

The passenger air bag module:

- is installed new as an assembly.
- is mounted in the passenger side of the instrument panel.
- cannot be interchanged between Expedition and Navigator vehicles.

Safety Canopy Module

Vehicles are equipped with safety canopies for protection during side impacts or rollover.

Vehicles with safety canopies require a specific headliner. When installing a new headliner on a vehicle equipped with safety canopies, make sure a headliner for safety canopies is being used. The word AIRBAG will appear on the headliner where it meets each B-pillar trim panel.

The safety canopy module:

- is installed as an assembly.
- is mounted above the headliner.
- attaches from the A-pillar frame to the D-pillar frame.
- is standard equipment.
- cannot be interchanged from side to side.
- is used in conjunction with side air bag module.

Safety Belt Pretensioners

As part of the SRS, the driver and front outboard passenger safety belt buckles are equipped with pretensioners. The safety belt buckle pretensioners remove excess slack from the safety belt webbing. The pretensioners are activated by the restraints control module (RCM) when the module detects a crash event force exceeding a programmed limit.

Safety Belt Buckle Switches

As part of the supplemental restraint system (SRS), the driver and front outboard passenger safety belt buckles are equipped with safety belt buckle switches. The safety belt buckle switches indicate to the restraints control module (RCM) whether the safety belts are connected or disconnected. The RCM uses this information in determining the deployment rate of the dual-stage driver and passenger air bag modules.

Seat Track Position Sensor

The seat track position sensor is mounted to a bracket attached to the outboard side of the driver seat track. The seat track position sensor informs the restraints control module (RCM) of the driver seat position. The RCM uses this information in determining the deployment rate of the dual-stage driver air bag module.

Secondary Air Bag Warning (Chime)

The secondary air bag warning chime, is an audible chime controlled by the instrument cluster module (ICM). If the ICM has detected a fault with the air bag warning indicator a diagnostic trouble code (DTC) will be stored in memory of the ICM. Upon receiving the message from the restraints control module (RCM) that a SRS fault has been detected, the ICM will sound the secondary air bag warning chime in a pattern of 5 sets of 5 beeps.

Restraints Control Module (RCM)

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.

WARNING: The restraints control module (RCM) orientation is critical for correct system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) has been involved in a collision in which the center tunnel area has been damaged, inspect the mounting and bracket for deformation. If damaged, a new RCM must be installed whether or not the air bags have deployed. In addition, make sure the area of the RCM mounting is restored to its original condition. Failure to follow these instructions may increase the risk of personal injury or death in a crash.

CAUTION: Prior to removal of the RCM module, it is necessary to upload module configuration information to the scan tool. This information needs to be downloaded into the new RCM module once installed. Refer to Section 418-01 .

NOTE: When a new PCM is installed, the air bag warning indicator will illuminate when the ignition switch is ON. The warning indicator will remain on untill PCM configuration is restored. Clear RCM DTCs.

NOTE: When installing a new restraints control module (RCM), always make sure the correct RCM is being installed. RCMs are not interchangeable between vehicles or vehicle lines. If an incorrect RCM is installed, erroneous DTCs and incorrect diagnosis will result.

The restraints control module (RCM) carries out the following functions:

- deploys the air bag(s) in the event of a deployable crash.
- activates the safety belt buckle pretensioners to remove slack from the safety belt.
- monitors the SRS for faults.
- illuminates the air bag warning indicator if a fault is detected.
- communicates through the data link connector (DLC) the current or historical diagnostic trouble codes (DTCs).

The RCM monitors the SRS for possible faults. If a fault is detected while the ignition switch is in the ON position, the RCM will request illumination of the air bag warning indicator located in the instrument cluster.

When the ignition switch is cycled (turned OFF and then ON), the air bag warning indicator will prove out by lighting for 6 seconds and then turn off. If a SRS fault exists, the air bag warning indicator will illuminate and remain illuminated for the rest of the key cycle. The RCM will also communicate the on-demand (current) and continuous (historical) DTCs through the DLC, to the scan tool. If the RCM requests illumination of the air bag warning indicator and the air bag warning indicator does not function, the instrument cluster module will automatically activate an audible chime. The chime is a series of 5 sets of 5 tone bursts. If the chime is heard, the SRS and the air bag warning indicator require repair.

The RCM includes a backup power supply. This feature provides sufficient backup power to deploy the air bags in the event that the ignition circuit is lost or damaged during impact. The backup power supply will deplete its stored energy approximately one minute after the battery ground cable is disconnected.

A new RCM installed in a vehicle will flash lamp fault code (LFC) 54 until programmable module installation (PMI) has been carried out on the RCM. If a LFC is present after completing PMI, a fault is present in the SRS and on-demand DTCs must be retrieved and diagnosed.

Electrical System

The electrical system that supports the air bag SRS:

- is powered from the battery through the ignition circuit.
- provides the electrical path from the restraints control module (RCM) to the SRS components.
- provides the electrical path from the RCM to the air bag warning indicator.
- provides the electrical path from the RCM to the data link connector (DLC).
- provides the electrical path from the RCM to the instrument cluster module.

Sensors

WARNING: The restraints control module (RCM) orientation is critical for correct system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) has been involved in a collision in which the center tunnel area has been damaged, inspect the mounting and bracket for deformation. If damaged, a new RCM must be installed whether or not the air bags have deployed. In addition, make sure the area of the RCM mounting is restored to its original condition. Failure to follow these instructions may increase the risk of personal injury or death in a crash.

WARNING: Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. Install a new and correctly position the sensor or any other damaged supplemental restraint system (SRS) components whether or not the air bag is deployed. Failure to follow these instructions may increase the risk of personal injury or death in a crash.

For these vehicles, the SRS uses 5 satellite sensors in addition to the RCM. The RCM is mounted to the center tunnel beneath the console. All vehicles will have one front impact severity sensor located in the front-center area of the vehicle, behind the grille mounted on the lower radiator support. The first row impact sensors are located in each of the front doors behind the trim panel, the second row sensors are located on each C-pillar. The side impact sensors are **not** interchangeable between the first and second row. Mounting orientation is critical for correct operation of all impact sensors.

Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)

Printable View (105 KB)

Special Tool(s)

ST1137-A	FLUKE 73III Automotive Meter 105-R0057 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit 105-R025C or equivalent

Air Bag Module Second Stage Deployment Check

Because the driver and passenger front air bags each have 2 deployment stages, it is possible that Stage 1 has deployed and Stage 2 has not.

If a front air bag module has deployed, it is **mandatory** that the front air bag module be remotely deployed using the appropriate air bag disposal procedure to make sure the second stage has been deployed.

- For information on driver or passenger air bag module remote deployment, refer to Pyrotechnic Device Disposal in this section.

Diagnosing Customer Concerns With On-Demand Diagnostic Trouble Codes (DTCs)

Most supplemental restraint system (SRS) diagnostic procedures will require depowering and repowering of the system. Depowering and repowering requires disconnecting of the battery and removal of the restraints control module (RCM) fuse. This reduces the risk of inadvertent deployment of SRS components while diagnostic procedures are being carried out.

Diagnosing Customer Concerns With Continuous Memory Diagnostic Trouble Codes (DTCs)

If an air bag warning indicator lamp ON is reported by the customer but is not present when the vehicle

comes in for service, follow the Diagnostic Instruction procedures in this section to identify the intermittent DTC.

Once the DTC is known, read the Normal Operation section of the pinpoint test for the DTC involved.

- Follow the depowering procedure as directed in this section.
- Determine the location of components involved in creating the DTC.
- Carry out a thorough visual inspection of:
    - components.
    - connectors.
    - splices and wiring harnesses.
    - insulation on conductors.

Refer to the Possible Causes section of the pinpoint test for the DTC involved, which lists the common concerns that relate to the DTC. Concerns are listed according to priority.

Prove Out Procedure

Turn the ignition switch from the OFF to the ON position and visually monitor the air bag warning indicator with all SRS components connected. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an SRS fault is present, the air bag warning indicator will:

- fail to light.
- remain lit continuously.
- flash.

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and an SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator will need to be repaired before diagnosis can continue.

Glossary

Secondary Air Bag Warning

The secondary air bag warning is an audible fault format that consists of 5 sets of 5 tone bursts, with each set of 5 tone bursts separated by a 5-second quiet period. One tone burst cycle will consist of one-second ON and one-second OFF. This series of 5 activations is repeated every 30 minutes.

Disconnect the Component

Disconnect the component means to disconnect the component vehicle harness connector, not to remove the component. Do not reconnect a disconnected component unless instructed to do so.

Deactivate the System

Deactivate the system means to carry out a deactivation procedure. Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

Depower the System

Depower the system means to disconnect the battery and remove the restraints control module (RCM)

fuse. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.

Deployment Loop

The deployment loop is made up of the RCM, deployable device, air bag(s), safety belt pretensioners (safety canopies, deployable steering columns, load limiting retractor, adaptive tether, adaptive vent, if equipped) and associated circuits.

Install a New Component

Install a new component means to remove the existing component and install a new authorized part obtained from Ford Customer Service Division.

Prove Out the System

Prove out the system means to turn the ignition switch from the OFF to the ON position, and to visually monitor the air bag warning indicator with the air bag modules, safety canopies/curtains and safety belt pretensioners connected. Refer to Prove Out Procedure in this section.

Reactivate the System

Reactivate the system means to carry out the reactivation procedure. Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

Repower the System

Repower the system means, turn the ignition ON, install the RCM fuse and connect the battery ground cable. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.

Reconnect the System

Reconnect the system means to reconnect all system components. Refer to Air Bag System Reconnect Checklist in this section.

Squib

A squib (igniter) is a device designed to convert electrical energy to the heat energy necessary to deploy a pyrotechnic restraints system device.

Verify the System

Verify the system means to prove out the system with restraint system components in place.

Air Bag Reconnect Checklist

The checklist below should be completed following diagnosis or repair of any air bag system concern:

- All in-seat harness connectors connected?
- All air bag modules connected?
- Safety canopy modules connected?
- Safety belt pretensioner connectors connected?
- Restraints control module (RCM) connected?
- All sensors (front and side impact sensors) connected?
- RCM fuse installed?
- Battery connected?

Diagnostic Instructions — Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)

Printable View (119 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit 105-R025C or equivalent

The symptom chart can be used to help locate supplemental restraint system (SRS) concerns if no diagnostic trouble codes (DTCs) are retrieved and the listed symptoms are observed. Whether or not the listed symptoms are observed, always carry out the following:

1. Retrieve all SRS DTCs stored in the restraints control module (RCM) memory.
2. Run the self-test to determine what on-demand and continuous memory DTCs are being sensed by the RCM.
3. If on-demand DTCs are different than continuous memory DTCs, always repair the on-demand DTCs first.

A DTC can indicate several concerns. The DTCs are to assist in system diagnosis and are not to be considered definitive. Always refer to the pinpoint test corresponding to the DTC to determine where the concern lies and to repair the concern correctly.

Diagnostic Test Mode

Scan tool options:

- On-demand/continuous memory
- Clear continuous memory DTCs

Refer to the manufacturer's literature for the scan tool being used for correct scan tool test options.

On-Demand

The on-demand Self Test option is used to verify that no electrical concerns exist with the air bag SRS. Upon entering the self-test, the RCM will make an electrical check of each electrical component in the

system. If a concern is detected, a DTC is displayed on the scan tool with a brief description of the DTC. The self-test should always be run after any repair to verify that the repair was successful.

To run the Self Test, follow these steps:

1. Connect the scan tool to the data link connector (DLC).
2. Turn the ignition switch to the ON position.
3. Follow the manufacturer's instructions for the scan tool being used.
4. Select RCM.
5. Select Self Test.
6. The module will run the self-test and display on-demand (reflecting hard system concerns) and continuous memory (historic) DTCs on the scan tool.

Continuous Memory and Clear DTCs

During vehicle operation, the RCM will detect and store both intermittent and hard failure DTCs in non-volatile memory. The DTC strategy employed by the RCM incorporates a time-out scheme for determining when a concern exists in the system. This requires a concern to exist for up to one minute in the system before the RCM will detect it. For the RCM to determine that a concern no longer exists, the concern must be absent for up to one minute. The actual detection time-outs vary with each DTC. DTCs can be retrieved with a scan tool using the Self Test option. All DTCs stored in the RCM will be displayed on the scan tool along with a brief description of the DTC. If no DTCs are present, the scan tool will display a SYSTEM PASSED message. This option can also be used to clear DTCs from the RCM memory, as long as the concern no longer exists.

Once 75 hours of operation have been recorded by the RCM since the concern was last detected, all continuous memory DTCs will automatically be removed from memory.

To retrieve or clear DTCs, follow these steps:

1. Connect the scan tool to the DLC.
2. Turn the ignition switch to the ON position.
3. Follow the manufacturer's instructions for the scan tool being used.
4. Select RCM.
5. Select Self Test.
6. **NOTE:** Before proceeding with the clearing operation, make note of the DTCs displayed. Once cleared, DTCs cannot be retrieved.

   All DTCs will be displayed on the screen.
7. Clear the DTCs. After clearing the DTCs, cycle the key OFF, then ON.
   - Continuous memory DTCs that have been cleared will **not** reoccur as "continuous memory" in the same key cycle. Only new DTCs which were **not** present before clearing can occur as "continuous memory" after clearing.

Bit-Mapped Diagnostic Trouble Codes (DTCs)

Many of the continuous memory and on-demand DTCs that can be present in the RCM provide general fault information and require accessing the associated bit-mapped parameter identification (PIDs) (fault PIDs) to identify the specific concern. DTCs that use fault PIDs are conceptually different from conventional DTCs.

Conventional DTCs identify a specific concern for a given component and point to a particular diagnostic path. In the diagnostic path, PIDs are sometimes used to determine the root cause.

DTCs that use fault PIDs do not identify the specific concern. The DTC identifies the component(s) or type of components in which the concern exists. The next level, fault PIDs, identifies the specific device and fault condition. Fault PIDs are available for both on-demand (active) and continuous memory (historic) DTCs. Those associated PIDs are an extension of the information provided by the DTC and are identified by the same DTC number. Using both DTC and the fault PID is necessary to define the specific fault present (in the same manner as normal DTCs do).

A scan tool must be used to view DTCs and their fault PIDs. Once a scan tool has retrieved a DTC, use the scan tool to view the fault PIDs. Viewing the fault PIDs must be carried out to identify the specific concern that is present. When the viewing of fault PIDs has been carried out, the scan tool can display the PIDs associated with that DTC, including the status or state that exists (on-demand DTC) or existed (continuous memory DTC). Refer to the manufacturer's instructions for the scan tool being used on how to view fault PIDs.

DataLogger PID/Data

The DataLogger PID/Data option allows the scan tool operator to read the state of several parameter IDs (PIDs) to aid in diagnosing the system. PIDs are real time measurements of parameters, such as voltages and resistances, calculated by the restraints control module (RCM) sent to the scan tool for display. Many of the PIDs supported by the modules are calculated periodically and are, therefore, not true real time readings.

To retrieve PIDs, follow these steps:

1. Connect the scan tool to the DLC.
2. Turn the ignition switch to the ON position.
3. Follow the manufacturer's instructions for the scan tool being used.
4. Select RCM.
5. Select DataLogger.
6. Record all PIDs that are to be retrieved and initiate PID retrieval. PIDs are updated continuously on the display.

Inspection and Verification

1. Verify the customer concern by checking the air bag warning indicator in the instrument cluster. Refer to Prove Out the System in this section.
2. Visually inspect for obvious signs of mechanical or electrical damage. Do not disconnect electrical connectors until directed to do so within the pinpoint test.

Visual Inspection Chart

Mechanical	Electrical
• Damaged restraints control module (RCM) or loose mounting • Damaged front impact severity sensor or loose mounting • Damaged side impact sensors or loose mounting (if equipped)	• Open smart power distribution junction box (SPDJB) fuse 32 (10A) • Damaged wiring harness • Loose or damaged connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record continuous memory diagnostic trouble codes (DTCs).

8. Clear the continuous DTCs and carry out the self-test diagnostics for the RCM.

9. If the DTCs retrieved are related to the concern, go to Supplemental Restraint System (SRS) Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Lamp Fault Codes

This vehicle supports lamp fault codes (LFC) **only** when the RCM is in plant mode. A new RCM installed in a vehicle will be in plan mode until:

- programmable module installation (PMI) has been carried out.
- the RCM sees a fault-free supplemental restraint system (no DTCs present).

If a LFC is present after completing PMI, a fault is present in the SRS and on-demand DTCs must be retrieved and diagnosed.

Restraints Control Module (RCM) Diagnostic Trouble Codes (DTCs)

The DTCs can be retrieved from the restraints control module (RCM) with a scan tool via the data link connector (DLC).

Supplemental Restraint System (SRS) Diagnostic Trouble Code (DTC) Chart

DTC [a]	Description	Action To Take
—	The Air Bag Warning Indicator is Illuminated Continuously (RCM Disconnected or Inoperative, Loss of Battery Feed or Loss of Signal Ground)	Go To Pinpoint Test A .
B1231	Event Threshold Exceeded (Crash Data Memory Full)	INSTALL a new RCM and impact sensors. REFER to Inspection and Repair After a Supplemental Restraint System (SRS) Deployment in this section.
B1317	Battery Voltage High	CHECK battery voltage; to be below 18 volts. REFER to Section 414-00 .
B1318	Battery Voltage Low	CHECK battery voltage; to be above 8 volts. REFER to Section 414-00 .
B1342	ECU (RCM) is Faulted	INSTALL a new RCM and CARRY OUT programmable module installation (PMI). REFER to Restraints Control Module (RCM) in this section.
B2292	Restraint System — Seatbelt Pretensioner Fault	Go To Pinpoint Test B .
B2293	Restraint System — Air Bag Fault	Go To Pinpoint Test C .
B2294	Restraint System — Curtain Fault	Go To Pinpoint Test D .
B2295	Restraint System — Side Air Bag Fault	Go To Pinpoint Test E .
B2296	Restraint System — Impact Sensor Fault	Go To Pinpoint Test F .
B2434	Drivers Seat Belt Buckle Switch Circuit Short to Ground	Go To Pinpoint Test G .
B2435	Drivers Seat Belt Buckle Switch Resistance Out of Range	Go To Pinpoint Test H .
B2438	Passengers Seat Belt Buckle Switch Short to Ground	Go To Pinpoint Test I .
B2439	Passengers Seat Belt Buckle Switch Resistance Out of Range	Go To Pinpoint Test J .
B2477	Module Configuration Failure	This DTC indicates programmable module installation (PMI) has not been done to a newly installed module. CARRY OUT PMI. REFER to Section 418-01 . CLEAR the DTC. CARRY OUT the self-test.
B2607	Harness/Configuration Mismatch	INSTALL a new RCM and CARRY OUT programmable module installation (PMI). REFER to Restraints Control Module (RCM) in this section.
B2691	Seat Belt Buckle Switch Circuit Fault,	Go To Pinpoint Test K .

	Front Driver's Side	
B2692	Front Passenger's Seat Belt Buckle Switch Circuit Fault	Go To Pinpoint Test L .
B2792	Cross Link Between Firing Loops (This DTC and the associated firing loops that are crossed will set applicable loop fault with low resistance on squib.)	Go To Pinpoint Test M .
B2900 —	VIN Mismatch	INSTALL a new RCM and CARRY OUT programmable module installation (PMI). REFER to Restraints Control Module (RCM) in this section.
C1414	Incorrect Module Design Level	Go To Pinpoint Test N .
C1946	Front Driver's Seat Track Position Switch Circuit Open	Go To Pinpoint Test O .
C1947	Front Driver's Seat Track Position Switch Circuit Short to Ground	Go To Pinpoint Test P .
C1948	Front Driver's Seat Track Position Switch Circuit Resistance Out of Range	Go To Pinpoint Test Q .
C1981	Front Driver's Seat Track Position Switch Circuit Fault	Go To Pinpoint Test R .
U0300	Internal Control Module Software Incompatibility	INSTALL a new RCM and CARRY OUT programmable module installation (PMI). REFER to Restraints Control Module (RCM) in this section.
U1900	CAN Communication Bus Fault — Receive Error	**NOTE:** DTC U1900 will set in a module that is reporting a communication fault from another module on the data bus. The module that reports the fault is not the problem module. Do not install a new RCM as part of repair for a RCM DTC U1900 fault. VIEW and RECORD U1900 fault PIDs to determine the module with the concern. REFER to Section 418-00 to diagnosis the HS-CAN/module concern.
U2050	No Application Present	INSTALL a new RCM and CARRY OUT programmable module installation (PMI). REFER to Restraints Control Module (RCM) in this section.
U2051	One or More Calibration Files Missing/Corrupt	INSTALL a new RCM and CARRY OUT programmable module installation (PMI). REFER to Restraints Control Module (RCM) in this section.

[a] DTC: Diagnostic trouble code, retrieved using scan tool.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• Air bag warning indicator is illuminated continuously	• Fuse • DTC • Wiring, terminals or connectors • Faulty diagnostic	• Go To Pinpoint Test A .

	connector • RCM • Instrument cluster module	
• Air bag warning indicator flashing	• RCM not configured or in plant mode	• CARRY OUT programmable module installation (PMI). REFER to Section 418-01 . If air bag warning indicator is flashing or has a continuous light after carrying out PMI, REFER to Supplemental Restraint System (SRS) Diagnostic Trouble Code (DTC) Chart to diagnose the concern.
• Audible tone (secondary warning) — DTCs retrieved	• Air bag SRS system fault	• REFER to Supplemental Restraint System (SRS) Diagnostic Trouble Code (DTC) Chart.
• No communication with the restraints control module (RCM)	• Open fuse • Circuitry • Scan tool • Data link connector (DLC) • RCM	• REFER to Section 418-00 to diagnose the no communication concern.

Pinpoint Tests — Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)

Printable View (1074 KB)

Special Tool(s)

ST1137-A	FLUKE 73III Automotive Meter 105-R0057 or equivalent

ST2574-A	Flex Probe Kit 105-R025C or equivalent

Pinpoint Tests

Pinpoint Test A: The Air Bag Warning Indicator is Illuminated Continuously

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

During normal operation, the air bag warning indicator will illuminate continuously for 6 seconds after the ignition switch is placed to the RUN or ON position. Be sure to cycle the ignition switch and look for a 6-second indicator prove-out without diagnostic trouble codes (DTCs). The restraints control module (RCM) will communicate to the instrument cluster module to turn the air bag warning indicator on or off. via the high-speed controller area network (HS-CAN). The RCM will also communicate over the HS-CAN DTCs to the scan tool through the data link connector (DLC).

Possible Causes

An air bag warning indicator that is illuminated continuously or no communication with the RCM can be caused by:

- a DTC.
- damaged wiring, terminals or connectors.
- damaged ignition circuit.

- RCM disconnected from the vehicle harness.
- a loss of RCM (case) ground.
- instrument cluster module.
- RCM is faulted.

PINPOINT TEST A: THE AIR BAG WARNING INDICATOR IS ILLUMINATED CONTINUOUSLY

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment.

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough Inspection and Verification before proceeding with the Pinpoint Test.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
A1 CHECK FOR CONTINUOUS OR ON-DEMAND SELF TEST DTCs	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Were any continuous memory or on-demand DTCs retrieved?**	**Yes** If continuous memory DTCs were retrieved, GO to A2 . If on-demand DTCs were retrieved, GO to the Supplemental Restraint System (SRS) Diagnostic Trouble Code (DTC) Chart in this section for pinpoint test direction. **No** If the RCM **does** communicate with the scan tool, GO to A2 . If the RCM **does not** communicate with the scan tool, REFER to Section 418-00 to diagnose the HS-CAN concern. GO to A4 .
A2 CHECK FOR INSTRUMENT	

CLUSTER MODULE DTCs	
• Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Were any continuous memory or on-demand DTCs retrieved?**	**Yes** REFER to Section 413-01 to diagnosis instrument cluster module concerns. GO to A4 . **No** If the instrument cluster module **does** communicate with the scan tool, GO to A3 . If the instrument cluster module **does not** communicate with the scan tool, REFER to Section 418-00 to diagnose the HS-CAN concern. GO to A4 .
A3 CHECK INSTRUMENT CLUSTER MODULE	
• Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Module Active Command — All Warning Lamps. • **Does the air bag warning indicator turn ON and OFF when using the active command?**	**Yes** INSTALL a new RCM and CARRY OUT programmable module installation (PMI). REFER to Restraints Control Module (RCM) in this section. GO to A4 . **No** INSTALL a new instrument cluster module. REFER to Section 413-01 . GO to A4 .
A4 CHECK FOR ADDITIONAL DTCs	
• Refer to the continuous memory DTCs recorded during Step A1. • **Were any continuous memory DTCs retrieved during Step A1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. RETEST the communication to the RCM. If previously directed to depower the system, REPOWER the system. REFER to Supplemental Restraint System (SRS) Depowering and Repowering in this section. PROVE OUT the system. CLEAR all RCM DTCs.

Pinpoint Test B: DTC B2292 — Restraint System — Seatbelt Pretensioner Fault

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors safety belt buckle pretensioner circuits for faults. The RCM will set a diagnostic trouble code (DTC) if a short to battery or short to ground fault is detected. The RCM will also set a DTC if the loop resistance is less than 0.9 ohm or greater than 5.0 ohms. The normal expected resistance range is 1.31 to 4.29 ohms. If a loop resistance is between 0.9 and 1.31 or between 4.29 and 5.0 ohms, there exists a strong potential for an intermittent fault. If the RCM detects one of the following faults on any of the safety belt buckle pretensioner circuits, it will store diagnostic trouble code (DTC) B2292 in memory and illuminate the air bag warning indicator.

Fault Conditions

The RCM monitors for the following fault conditions:

- Loop resistance less than 0.9 ohm (Low resistance)

- Loop resistance greater than 5.0 ohms (Circuit open)
- Circuit short to voltage
- Circuit short to ground

Possible Causes

A safety belt buckle pretensioner fault can be caused by:

- damaged wiring, terminals or connectors.
- a faulty safety belt buckle pretensioner.
- RCM is faulted.

PINPOINT TEST B: DTC B2292 — RESTRAINT SYSTEM — SEATBELT PRETENSIONER FAULT

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough Inspection and Verification before proceeding with the Pinpoint Test.

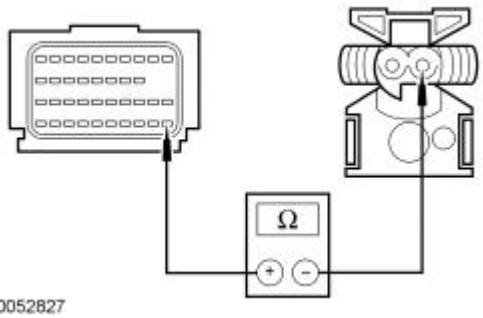
NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
B1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2292 Fault PIDs. • **Was on-demand DTC B2292 retrieved?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Using the fault PIDs recorded, GO to the appropriate pinpoint test step. For driver safety belt buckle

	pretensioner with a low resistance fault, GO to B2 . For driver safety belt buckle pretensioner with an open circuit fault, GO to B2 . For driver safety belt buckle pretensioner with a short to ground fault, GO to B9 . For driver safety belt buckle pretensioner with a short to battery fault, GO to B11 . For passenger safety belt buckle pretensioner with a low resistance fault, GO to B12 . For passenger safety belt buckle pretensioner with an open circuit fault, GO to B12 . For passenger safety belt buckle pretensioner with a short to ground fault, GO to B19 . For passenger safety belt buckle pretensioner with a short to battery fault, GO to B21 . **No** This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Using the fault PIDs recorded, GO to the appropriate pinpoint test step. For driver or passenger safety belt buckle pretensioner with a low resistance or open circuit fault, GO to B24 . For driver or passenger safety belt buckle pretensioner with a short to ground fault, GO to B26 . For driver or passenger safety belt buckle pretensioner with a short to battery fault, GO to B27 .
B2 CHECK THE DRIVER SAFETY BELT PRETENSIONER RESISTANCE PID	
• Enter the following diagnostic mode on the diagnostic tool: DataLogger/PID.	**Yes** GO to B23 .

• Enter the following diagnostic mode on the diagnostic tool: Driver Safety Belt Buckle Pretensioner Resistance PID . • **Is the resistance between 1.31 and 4.29 ohms?**	**No** GO to B3 .
B3 CHECK DRIVER SAFETY BELT BUCKLE PRETENSIONER RESISTANCE PID WHILE CARRYING OUT A HARNESS TEST	
• Continue monitoring the driver safety belt buckle pretensioner resistance PID while carrying out a harness test of the driver safety belt buckle pretensioner circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness. • **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out a harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to B28 . **No** If the driver safety belt buckle pretensioner resistance PID is less than 1.31 ohms, GO to B4 . If the driver safety belt buckle pretensioner resistance PID is greater than 4.29 ohms, GO to B6 .
B4 CHECK THE DRIVER SAFETY BELT BUCKLE PRETENSIONER FOR LOW RESISTANCE	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Belt Buckle Pretensioner C3201. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2292 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2292 on-demand fault PIDs with the driver pretensioner disconnected, an open circuit fault would normally be retrieved. • **Did the driver safety belt buckle pretensioner on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	**Yes** GO to B22 . **No** GO to B5 .
B5 CHECK DRIVER SAFETY BELT BUCKLE PRETENSIONER CIRCUIT CR120 (BU/OG) AND CIRCUIT RR120 (BN/GN) FOR LOW RESISTANCE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.	**Yes** GO to B23 .

• Disconnect: RCM C310a and C310b. • Measure the resistance between driver safety belt buckle pretensioner C3201-1, circuit CR120 (BU/OG), harness side and C3201-2, circuit RR120 (GN/RD), harness side.  N0005043 • **Is the resistance greater than 1,000,000 ohms?**	**No** REPAIR circuit CR120 (BU/OG) and circuit RR120 (BN/GN). GO to B28 .
B6 CHECK THE DRIVER SAFETY BELT BUCKLE PRETENSIONER FOR AN OPEN	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Belt Buckle Pretensioner C3201. • Connect a jumper wire between driver safety belt pretensioner C3201-1, circuit CR120 (BU/OG), harness side and C3201-2, circuit RR120 (BN/GN), harness side. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2292 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2292 on-demand fault PIDs with the driver pretensioner circuits shorted together, a low resistance fault would normally be retrieved. • **Did the driver safety belt buckle pretensioner on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**	**Yes** GO to B22 . **No** GO to B7 .
B7 CHECK CIRCUIT CR120 (BU/OG) FOR AN OPEN	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from the driver safety belt buckle pretensioner C3201. • Disconnect: RCM C310a and C310b. • Measure the resistance between RCM C310b-31, circuit CR120 (BU/OG), harness side and driver safety belt buckle pretensioner C3201-1, circuit CR120 (BU/OG), harness side.	**Yes** GO to B8 . **No** REPAIR circuit CR120 (BU/OG). GO to B28 .



- **Is the resistance less than 0.5 ohm?**

B8 CHECK CIRCUIT RR120 (BN/GN) FOR AN OPEN	
• Measure the resistance between RCM C310b-32, circuit RR120 (BN/GN), harness side and driver safety belt buckle pretensioner C3201-2, circuit RR120 (GN/RD), harness side.  • **Is the resistance less than 0.5 ohm?**	**Yes** GO to B23 . **No** REPAIR circuit RR120 (BN/GN). GO to B28 .
B9 CHECK THE DRIVER SAFETY BELT BUCKLE PRETENSIONER FOR A SHORT TO GROUND	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Belt Buckle Pretensioner C3201. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2292 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2292 on-demand fault PIDs with the driver pretensioner disconnected, an open circuit fault would normally be retrieved. • **Did the driver safety belt buckle pretensioner on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	**Yes** GO to B22 . **No** GO to B10 .
B10 CHECK CIRCUIT CR120 (BU/OG) AND CIRCUIT RR120 (BN/GN) FOR A SHORT TO GROUND	
• Key in OFF position.	**Yes** GO to B23 .

• Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b. • Measure the resistance between driver safety belt buckle pretensioner C3201-1, circuit CR120 (BU/OG), harness side and ground; and between driver safety belt buckle pretensioner C3201-2, circuit RR120 (GN/RD), harness side and ground.  A0094831 • **Are the resistances greater than 1,000,000 ohms?**	**No** REPAIR circuit CR120 (BU/OG) or circuit RR120 (GN/RD). GO to B28 .
B11 CHECK CIRCUIT CR120 (BU/OG) AND CIRCUIT RR120 (BN/GN) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Side Air Bag Module C3051. • Disconnect: Driver Safety Belt Buckle Pretensioner C3201. • Disconnect: RCM C310a and C310b. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Measure the voltage between driver safety belt buckle pretensioner C3201-1, circuit CR120 (BU/OG), harness side and ground; and between driver safety belt buckle pretensioner C3201-2, circuit RR120 (GN/RD), harness side and ground.  A0094832 • **Are the voltages less than 0.2 volt?**	**Yes** GO to B23 . **No** REPAIR circuit CR120 (BU/OG) or circuit RR120 (BN/GN). GO to B28 .
B12 CHECK THE PASSENGER SAFETY BELT PRETENSIONER RESISTANCE PID	
• Enter the following diagnostic mode on the diagnostic tool: DataLogger/PID. • Enter the following diagnostic mode on the diagnostic tool: Passenger Safety Belt Buckle Pretensioner Resistance PID . • **Is the resistance between 1.31 and 4.29 ohms?**	**Yes** GO to B23 . **No** GO to B13 .
B13 CHECK THE PASSENGER SAFETY BELT BUCKLE PRETENSIONER RESISTANCE PID WHILE CARRYING OUT A	

HARNESS TEST	
• Continue monitoring the passenger safety belt buckle pretensioner resistance PID while carrying out a harness test of the passenger safety belt buckle pretensioner circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness. • **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to B28 . **No** If the passenger safety belt buckle pretensioner resistance PID is less than 1.31 ohms, GO to B14 . If the passenger safety belt buckle pretensioner resistance PID is greater than 4.29 ohms, GO to B16 .
B14 CHECK THE PASSENGER SAFETY BELT BUCKLE PRETENSIONER FOR LOW RESISTANCE	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Safety Belt Buckle Pretensioner C3202. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2292 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2292 on-demand fault PIDs with the passenger pretensioner disconnected, an open circuit fault would normally be retrieved. • **Did the passenger safety belt buckle pretensioner on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	**Yes** GO to B22 . **No** GO to B15 .
B15 CHECK PASSENGER SAFETY BELT BUCKLE PRETENSIONER CIRCUIT RR122 (BN) AND CIRCUIT CR122 (WH/OG) FOR LOW RESISTANCE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b. • Measure the resistance between passenger safety belt buckle pretensioner C3202-1, circuit CR122 (WH/OG),	**Yes** GO to B23 . **No** REPAIR circuit CR122 (WH/OG) and circuit RR122

harness side and C3202-2, circuit RR122 (BN), harness side.  N0005043 • **Is the resistance greater than 1,000,000 ohms?**	(BN). GO to B28 .
B16 CHECK THE PASSENGER SAFETY BELT BUCKLE PRETENSIONER FOR AN OPEN	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Safety Belt Buckle Pretensioner C3202. • Connect a jumper wire between passenger safety belt pretensioner C3202-1, circuit CR122 (WH/OG), harness side and C3202-2, circuit RR122 (BN), harness side. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2292 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2292 on-demand fault PIDs with the passenger pretensioner circuits shorted together, a low resistance fault would normally be retrieved. • **Did the passenger safety belt buckle pretensioner on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**	**Yes** GO to B22 . **No** GO to B17 .
B17 CHECK CIRCUIT RR122 (BN) FOR AN OPEN	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from passenger safety belt buckle pretensioner C3202. • Disconnect: RCM C310a and C310b. • Measure the resistance between RCM C310b-33, circuit RR122 (BN), harness side and passenger safety belt buckle pretensioner C3202-2, circuit RR122 (BU/RD), harness side.	**Yes** GO to B18 . **No** REPAIR circuit RR122 (BN). GO to B28 .

 N0052830 • **Is the resistance less than 0.5 ohm?**	
B18 CHECK CIRCUIT CR122 (WH/OG) FOR AN OPEN	**Yes** GO to B23 . **No** REPAIR circuit CR122 (WH/OG). GO to B28 .
• Measure the resistance between RCM C310b-34, circuit CR122 (WH/OG), harness side and passenger safety belt buckle pretensioner C3202-1, circuit CR122 (YE/BK), harness side.  N0052829 • **Is the resistance less than 0.5 ohm?**	
B19 CHECK THE PASSENGER SAFETY BELT BUCKLE PRETENSIONER FOR A SHORT TO GROUND	**Yes** GO to B22 . **No** GO to B20 .
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Safety Belt Buckle Pretensioner C3202. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2292 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2292 on-demand fault PIDs with the passenger pretensioner disconnected, an open circuit fault would normally be retrieved. • **Did the passenger safety belt buckle pretensioner on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	
B20 CHECK CIRCUIT RR122 (BN) AND CIRCUIT CR122 (YE/BK) FOR A SHORT TO GROUND	**Yes**

• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b. • Measure the resistance between passenger safety belt buckle pretensioner C3202-2, circuit RR122 (BU/RD), harness side and ground; and between passenger safety belt buckle pretensioner C3202-1, circuit CR122 (YE/BK), harness side and ground.  A0094831 • **Are the resistances greater than 1,000,000 ohms?**	GO to B23 . **No** REPAIR circuit RR122 (BN) or circuit CR122 (YE/BK). GO to B28 .
B21 CHECK CIRCUIT RR122 (BN) AND CIRCUIT CR122 (WH/OG) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Side Air Bag Module C3052. • Disconnect: Passenger Safety Belt Buckle Pretensioner C3202. • Disconnect: RCM C310a and C310b. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Measure the voltage between passenger safety belt buckle pretensioner C3202-2, circuit RR122 (BU/RD), harness side and ground; and between passenger safety belt buckle pretensioner C3202-1, circuit CR122 (YE/BK), harness side and ground.  A0094832 • **Are the voltages less than 0.2 volt?**	**Yes** GO to B23 . **No** REPAIR circuit RR122 (BN) or circuit CR122 (WH/OG). GO to B28 .
B22 CONFIRM THE SAFETY BELT BUCKLE PRETENSIONER FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.	**Yes** INSTALL a new driver or passenger safety belt buckle pretensioner. REFER to Section 501-20A . GO to B28 .

• Connect: Affected Safety Belt Buckle Pretensioner C3201 (Driver) C3202 (Passenger). • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2292 Fault PIDs. • **Was on-demand DTC B2292 retrieved?**	**No** In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, GO to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. For driver or passenger safety belt buckle pretensioner with a low resistance or open circuit fault, GO to B24 . For driver or passenger safety belt buckle pretensioner with a short to ground fault, GO to B26 . For driver or passenger safety belt buckle pretensioner with a short to battery fault, GO to B27 .
B23 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: All Restraint System Components (If previously disconnected). • Connect: RCM C310a and C310b (If previously disconnected). • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2292 Fault PIDs. • **Was on-demand DTC B2292 retrieved?**	**Yes** INSTALL a new RCM and CARRY OUT programmable module installation (PMI). REFER to Restraints Control Module (RCM) . GO to B28 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, GO to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. For driver or passenger safety belt buckle pretensioner with a low resistance or open circuit fault, GO to B24 . For driver or passenger safety belt buckle pretensioner with a short to ground fault, GO to B26 . For driver or passenger safety belt buckle pretensioner with

	a short to battery fault, GO to B27 .
B24 CHECK FOR AN INTERMITTENT SAFETY BELT BUCKLE PRETENSIONER LOW RESISTANCE OR OPEN CIRCUIT FAULT	

• If the fault PID was reported for the driver safety belt buckle pretensioner, monitor the following on the scan tool:
  ▪ driver safety belt buckle pretensioner resistance PID.
• If the fault PID was reported for the passenger safety belt buckle pretensioner, monitor the following on the scan tool:
  ▪ passenger safety belt buckle pretensioner resistance PID.
• **NOTE:** A resistance PID that reads between 0.9 and 1.31 ohms or between 4.29 and 5.0 ohms may or may not set an on-demand DTC yet indicates a strong potential of an intermittent fault condition. Make sure to thoroughly check wire harness(es), connectors and terminals as they are the likely source of the fault condition.
• Attempt to recreate the fault by wiggling the connectors (including any inline connectors) and flexing the wire harness.
• **Does any safety belt buckle pretensioner resistance PID indicate less than 1.31 ohms or greater than 4.29 ohms?**
	Yes
	DEPOWER the SRS and REPAIR as necessary.
	
	Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information.
	
	GO to B28 .
	
	No
	GO to B25 .

B25 CHECK THE HARNESS AND CONNECTORS	

• Key in OFF position.
• Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect the affected safety belt buckle pretensioner C3201 (driver) or C3202 (passenger):
  ▪ inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
  ▪ inspect wire harness for any damage, pinched, cut or pierced wires.
• **Were any concerns found?**
	Yes
	REPAIR as necessary.
	
	Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information.
	
	GO to B28 .
	
	No
	The fault is not present and cannot be recreated at this time. GO to B28 .

B26 CHECK FOR AN INTERMITTENT SAFETY BELT BUCKLE PRETENSIONER CIRCUIT SHORT TO GROUND FAULT	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/PID. • If the fault PID was reported for the driver safety belt buckle pretensioner, monitor the driver safety belt buckle pretensioner short to ground on-demand fault PID on the scan tool. • If the fault PID was reported for the passenger safety belt buckle pretensioner, monitor the passenger safety belt buckle pretensioner short to ground on-demand fault PID on the scan tool. • **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update. • Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness. • **Does any safety belt buckle pretensioner on-demand fault PID indicate a fault is present?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to B28 . **No** The fault is not present and cannot be recreated at this time. GO to B28 .

B27 CHECK FOR AN INTERMITTENT SAFETY BELT PRETENSIONER CIRCUIT SHORT TO BATTERY FAULT	

• Key in OFF position.
• Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect the side air bag module electrical connector C3051 (driver) or C3252 (passenger) on the side with the affected pretensioner.
• Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• If the fault PID was reported for the driver safety belt buckle pretensioner:
  ▪ monitor the driver safety belt buckle pretensioner short to battery on-demand fault PID.
• If the fault PID was reported for the passenger safety belt buckle pretensioner:
  ▪ monitor the passenger safety belt buckle pretensioner short to battery on-demand fault PID.
• Key in ON position.
• Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs.
• Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2292 Fault PIDs.
• **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.
• Attempt to recreate the fault by wiggling the connectors (including any inline connectors) and flexing the wire harness.
• **Does the safety belt buckle pretensioner short to battery on-demand fault PID indicate a fault is present?**
	Yes
	DEPOWER the SRS and REPAIR as necessary.
	
	Refer to Wiring Diagrams Cell 5, Connector Repair Procedures for schematic and connector information.
	
	GO to B28.
	
	No
	The fault is not present and cannot be recreated at this time. GO to B28.

B28 CHECK FOR ADDITIONAL DTCs	
• Refer to the continuous memory DTCs recorded during Step B1. • **Were any continuous memory DTCs retrieved during Step B1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. If previously directed to depower the system, REPOWER the system. REFER to Supplemental Restraint System (SRS) Depowering and Repowering in this section. PROVE OUT the system. CLEAR all RCM DTCs.

Pinpoint Test C: DTC B2293 — Restraint System — Air Bag Fault

Refer to Wiring Diagrams Cell 46, Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors all front air bag module circuits for faults. The RCM will set a diagnostic trouble code (DTC) if a short to battery or short to ground fault is detected. The RCM will also set a DTC if the loop resistance is less than 1.31 ohm or greater than 5.0 ohms. The normal expected resistance range is 1.31 to 4.29 ohms. If a loop resistance is between 0.9 and 1.31 or between 4.29 and 5.0 ohms, there exists a strong potential for an intermittent fault. If the RCM detects a fault on any of the front air bag circuits, it will store DTC B2293 in memory and illuminate the air bag warning indicator.

Fault Conditions

The RCM monitors for the following fault conditions:

- Loop resistance less than 0.9 ohm (Low resistance)
- Loop resistance greater than 5.0 ohms (Circuit open)
- Circuit short to voltage
- Circuit short to ground

Possible Causes

A driver air bag fault can be caused by:

- damaged wiring, terminals or connectors.
- a faulty clockspring.
- a faulty driver air bag module.
- RCM is faulted.

A passenger air bag fault can be caused by:

- damaged wiring, terminals or connectors.
- a faulty passenger air bag module.
- RCM is faulted.

PINPOINT TEST C: DTC B2293 — RESTRAINT SYSTEM — AIR BAG FAULT

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough Inspection and Verification before proceeding with the Pinpoint Test.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
C1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2293 Fault PIDs. • **Was on-demand DTC B2293 retrieved?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Using the fault PIDs recorded, GO to the appropriate pinpoint test step. For driver air bag module loop 1 with a low resistance fault, GO to C2 . For driver air bag module loop 1 with an open circuit fault, GO to C2 . For driver air bag module loop 1 with a short to ground fault, GO to C10 . For driver air bag module loop 1 with a short to battery fault, GO to C13 . For driver air bag module loop 2 with a low resistance fault, GO to C15 . For driver air bag module loop 2 with an open circuit fault, GO to C15 . For driver air bag module loop 2 with a short to ground fault, GO to C23 . For driver air bag module loop 2 with a short to battery fault, GO to C26 . For passenger air bag module loop 1 with a low resistance fault, GO to C28 . For passenger air bag module loop 1 with an open circuit fault, GO to C28 . For passenger air bag module loop 1 with a short to ground fault, GO to C34 . For passenger air bag module loop 1 with a short to battery fault, GO to C36 .

	For passenger air bag module loop 2 with a low resistance fault, GO to C37 . For passenger air bag module loop 2 with an open circuit fault, GO to C37 . For passenger air bag module loop 2 with a short to ground fault, GO to C43 . For passenger air bag module loop 2 with a short to battery fault, GO to C45 . **No** This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Using the fault PIDs recorded, GO to the appropriate pinpoint test step. For driver air bag module loop 1 or loop 2 with a low resistance fault, GO to C50 . For driver air bag module loop 1 or loop 2 with an open circuit fault, GO to C50 . For driver air bag module loop 1 with a short to ground fault, GO to C51 . For driver air bag module loop 1 with a short to battery fault, GO to C53 . For driver air bag module loop 2 with a short to ground fault, GO to C51 . For driver air bag module loop 2 with a short to battery fault, GO to C53 . For passenger air bag module loop 1 or loop 2 with a low resistance fault, GO to C50 . For passenger air bag module loop 1 or loop 2 with an open circuit fault, GO to C50 .

	For passenger air bag module loop 1 with a short to ground fault, GO to C52 . For passenger air bag module loop 1 with a short to battery fault, GO to C54 . For passenger air bag module loop 2 with a short to ground fault, GO to C52 . For passenger air bag module loop 2 with a short to battery fault, GO to C54 .
C2 CHECK THE DRIVER AIR BAG MODULE LOOP 1 RESISTANCE PID	
• Enter the following diagnostic mode on the diagnostic tool: DataLogger/PID. • Enter the following diagnostic mode on the diagnostic tool: Driver Air Bag Module Loop 1 Resistance PID. • **Is the resistance between 1.31 and 4.29 ohms?**	**Yes** GO to C49 . **No** GO to C3 .
C3 CHECK THE DRIVER AIR BAG MODULE LOOP 1 RESISTANCE PID WHILE CARRYING OUT A HARNESS TEST	
• **NOTE:** Do not remove the driver air bag module from its mounted position at this time. • With the driver air bag in its mounted position, continue monitoring the driver air bag module loop 1 resistance PID while carrying out a harness test of the driver air bag circuits and accessible connectors (including any inline connectors) by wiggling and flexing the wire harness, connectors, tilting and rotating the steering wheel frequently. • **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness or INSTALL a new clockspring as needed. REFER to Clockspring in this section. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to C56 . **No** If the driver air bag module loop 1 resistance PID is less than 1.31 ohms, GO to C4 . If the driver air bag module loop 1 resistance PID is greater than 4.29 ohms, GO to C7 .
C4 CHECK THE DRIVER AIR BAG MODULE LOOP 1 FOR LOW RESISTANCE	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Air Bag	**Yes** GO to C46 . **No** GO to C5 .

Module in this section. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2293 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2. • **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	
C5 CHECK THE DRIVER AIR BAG MODULE LOOP 1 CIRCUITS FOR LOW RESISTANCE BETWEEN THE CLOCKSPRING AND RCM	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Disconnect: Clockspring C218a. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2293 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module/clockspring disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2. • **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	**Yes** GO to C48 . **No** GO to C6 .
C6 CHECK THE RCM FOR LOW RESISTANCE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b. • Measure the resistance between RCM C310a pin 3 and C310a pin 4, component side.  • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR circuit CR101 (VT/BN) and circuit RR101 (YE/GN). GO to C56 . **No** GO to C49 .
C7 CHECK THE DRIVER AIR BAG MODULE LOOP 1	

CIRCUITS FOR AN OPEN BETWEEN THE DRIVER AIR BAG MODULE AND RCM	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Air Bag Module in this section. • Connect a jumper wire between driver air bag module loop 1 electrical connector pin-1, harness side and pin-2, harness side. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2293 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module loop 1 circuits shorted together, a low resistance fault would normally be retrieved on loop 1. Loop 2 will show an open circuit fault due to the driver air bag being disconnected. • **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a open circuit to a low resistance fault?**	**Yes** GO to C46 . **No** GO to C8 .
C8 CHECK THE DRIVER AIR BAG MODULE LOOP 1 CIRCUITS FOR OPEN BETWEEN THE CLOCKSPRING AND RCM	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Remove the jumper wire from driver air bag module loop 1 electrical connector. • Disconnect: Clockspring C218a. • Connect a jumper wire between clockspring C218a-1, circuit CR101 (VT/BN), harness side and clockspring C218a-9, circuit RR101 (YE/GN), harness side. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2293 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module loop 1 circuits shorted together, a low resistance fault would normally be retrieved on loop 1. Loop 2 will show an open circuit fault due to the driver air bag being disconnected. • **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a open circuit to a low resistance fault?**	**Yes** GO to C48 . **No** GO to C9 .

C9 CHECK DRIVER AIR BAG MODULE LOOP 1 CIRCUIT CR101 (VT/BN) AND CIRCUIT RR101 (YE/GN) FOR AN OPEN BETWEEN THE CLOCKSPRING AND RCM	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from the clockspring connector. • Disconnect: RCM C310a and C310b. • Measure the resistance between RCM C310a-4, circuit CR101 (VT/BN), harness side and clockspring C218a-1, circuit CR101 (VT/BN), harness side; and between RCM C310a-3, circuit RR101 (YE/GN), harness side and clockspring C218a-9, circuit RR101 (YE/GN), harness side.  N0052828 • **Are the resistances less than 0.5 ohm?**	**Yes** GO to C49 . **No** REPAIR circuit CR101 (VT/BN) or circuit RR101 (YE/GN). GO to C56 .
C10 CHECK THE DRIVER AIR BAG MODULE LOOP 1 CIRCUITS FOR A SHORT TO GROUND	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Air Bag Module in this section. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2293 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2. • **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	**Yes** GO to C46 . **No** GO to C11 .
C11 CHECK THE DRIVER AIR BAG MODULE LOOP 1 CIRCUITS FOR A SHORT TO GROUND BETWEEN THE RCM AND CLOCKSPRING	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the	**Yes** GO to C48 . **No**

fault. • Key in OFF position. • Disconnect: Clockspring C218a. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2293 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the clockspring disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2. • **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	GO to C12 .
C12 CHECK CIRCUIT CR101 (VT/BN) AND CIRCUIT RR101 (YE/GN) FOR A SHORT TO GROUND BETWEEN THE RCM AND CLOCKSPRING	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b. • Measure the resistance between clockspring C218a-1, circuit CR101 (VT/BN), harness side and ground; and between clockspring C218a-9, circuit RR101 (YE/GN), harness side and ground.  • **Are the resistances greater than 1,000,000 ohms?**	**Yes** GO to C49 . **No** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR101 (VT/BN) or circuit RR101 (YE/GN). GO to C56 .
C13 CHECK THE DRIVER AIR BAG MODULE LOOP 1 CIRCUITS FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND CLOCKSPRING	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Air Bag Module in this section. • Disconnect: Clockspring C218a. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool:	**Yes** GO to C48 . **No** GO to C14 .

DataLogger/View and Record DTC B2293 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module/clockspring disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2. • **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a short to battery to an open circuit fault?**	
C14 CHECK CIRCUIT CR101 (VT/BN) AND CIRCUIT RR101 (YE/GN) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND CLOCKSPRING	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Measure the voltage between clockspring C218a-1, circuit CR101 (VT/BN), harness side and ground; and between clockspring C218a-9, circuit RR101 (YE/GN), harness side and ground.  N0036962 • **Are the voltages less than 0.2 volt?**	**Yes** GO to C49 . **No** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR101 (VT/BN) or circuit RR101 (YE/GN). GO to C56 .
C15 CHECK THE DRIVER AIR BAG MODULE LOOP 2 RESISTANCE PID	
• Enter the following diagnostic mode on the diagnostic tool: DataLogger/PID. • Enter the following diagnostic mode on the diagnostic tool: Driver Air Bag Module Loop 2 Resistance PID. • **Is the resistance between 1.31 and 4.29 ohms?**	**Yes** GO to C49 . **No** GO to C16 .
C16 CHECK THE DRIVER AIR BAG MODULE LOOP 2 RESISTANCE PID WHILE CARRYING OUT A HARNESS TEST	
• **NOTE:** Do not remove the driver air bag module from its mounted position at this time. • With the driver air bag in its mounted position, continue monitoring the driver air bag module loop 2 resistance PID while carrying out a harness test of the driver air bag circuits and accessible connectors (including any inline connectors), by wiggling and flexing the wire harness, connectors, tilting and rotating the steering wheel frequently. • **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness or INSTALL a new clockspring as needed. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to C56 . **No**

	If the driver air bag module loop 2 resistance PID is less than 1.31 ohms, GO to C17 . If the driver air bag module loop 2 resistance PID is greater than 4.29 ohms, GO to C20 .
C17 CHECK THE DRIVER AIR BAG MODULE LOOP 2 FOR LOW RESISTANCE	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Air Bag Module in this section. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2293 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2. • **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	**Yes** GO to C46 . **No** GO to C18 .
C18 CHECK THE DRIVER AIR BAG MODULE LOOP 2 CIRCUITS FOR LOW RESISTANCE BETWEEN THE CLOCKSPRING AND RCM	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Disconnect: Clockspring C218a. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2293 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module/clockspring disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2. • **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	**Yes** GO to C48 . **No** GO to C19 .
C19 CHECK THE RCM FOR LOW RESISTANCE	

• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b. • Measure the resistance between RCM C310a pin 15 and C310a pin 16, component side.  • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR circuit CR102 (BU) and circuit RR102 (WH). GO to C56. **No** GO to C49.
C20 CHECK THE DRIVER AIR BAG MODULE LOOP 2 CIRCUITS FOR AN OPEN BETWEEN THE DRIVER AIR BAG MODULE AND RCM	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Air Bag Module in this section. • Connect a jumper wire between driver air bag module loop 2 electrical connector, pin-1, harness side and pin-2, harness side. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2293 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module loop 2 circuits shorted together, a low resistance fault would normally be retrieved on loop 2. Loop 1 will show an open circuit fault due to the driver air bag being disconnected. • **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**	**Yes** GO to C46. **No** GO to C21.
C21 CHECK THE DRIVER AIR BAG MODULE LOOP 2 CIRCUITS FOR AN OPEN BETWEEN THE CLOCKSPRING AND RCM	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position.	**Yes** GO to C48. **No** GO to C22.

• Remove the jumper wire from driver air bag module loop 2 electrical connector. • Disconnect: Clockspring C218a. • Connect a jumper wire between clockspring C218a-2, circuit CR102 (BU), harness side and clockspring C218a-10, circuit RR102 (WH), harness side. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2293 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module loop 2 circuits shorted together, a low resistance fault would normally be retrieved on loop 2. Loop 1 will show an open circuit fault due to the driver air bag being disconnected. • **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**	
C22 CHECK DRIVER AIR BAG MODULE LOOP 2 CIRCUIT CR102 (BU) AND CIRCUIT RR102 (WH) FOR AN OPEN BETWEEN THE CLOCKSPRING AND RCM	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from the clockspring connector. • Disconnect: RCM C310a and C310b. • Measure the resistance between RCM C310a-16, circuit CR102 (BU), harness side and clockspring C218a-2, circuit CR102 (BU), harness side; and between RCM C310a-15, circuit RR102 (WH), harness side and clockspring C218a-10, circuit RR102 (WH), harness side.  • **Are the resistances less than 0.5 ohm?**	**Yes** GO to C49 . **No** REPAIR circuit CR102 (BU) or circuit RR102 (WH). GO to C56 .
C23 CHECK THE DRIVER AIR BAG MODULE LOOP 2 CIRCUITS FOR A SHORT TO GROUND	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Air Bag Module in this section. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.	**Yes** GO to C46 . **No** GO to C24 .

• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2293 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2. • **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	
C24 CHECK THE DRIVER AIR BAG MODULE LOOP 2 CIRCUITS FOR A SHORT TO GROUND BETWEEN THE RCM AND CLOCKSPRING	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Disconnect: Clockspring C218a. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2293 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2. • **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	**Yes** GO to C48 . **No** GO to C25 .
C25 CHECK CIRCUIT CR102 (BU) AND CIRCUIT RR102 (WH) FOR A SHORT TO GROUND BETWEEN THE RCM AND CLOCKSPRING	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b. • Measure the resistance between clockspring C218a-2, circuit CR102 (BU), harness side and ground; and between clockspring C218a-10, circuit RR102 (WH), harness side and ground.  N0055543 • **Are the resistances greater than 1,000,000 ohms?**	**Yes** GO to C49 . **No** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR102 (BU) or circuit RR102 (WH). GO to C56 .
C26 CHECK THE DRIVER AIR BAG MODULE LOOP 2	

CIRCUITS FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND CLOCKSPRING	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Air Bag Module in this section. • Disconnect: Clockspring C218a. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2293 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module/clockspring disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2. • **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating a short to battery to an open circuit fault?**	**Yes** GO to C48 . **No** GO to C27 .
C27 CHECK CIRCUIT CR102 (BU) AND CIRCUIT RR102 (WH) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND CLOCKSPRING	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Measure the voltage between clockspring C218a-2, circuit CR102 (BU), harness side and ground; and between clockspring C218a-10, circuit RR102 (WH), harness side and ground.  N0037635 • **Are the voltages less than 0.2 volt?**	**Yes** GO to C49 . **No** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR102 (BU) or circuit RR102 (WH). GO to C56 .
C28 CHECK THE PASSENGER AIR BAG MODULE LOOP 1 RESISTANCE PID	
• Enter the following diagnostic mode on the diagnostic tool: DataLogger/PID.	**Yes** GO to C49 .

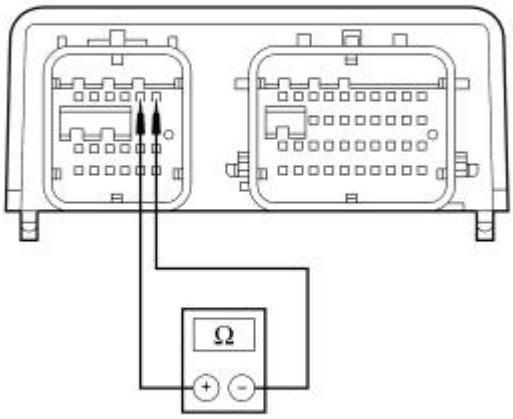
• Enter the following diagnostic mode on the diagnostic tool: Passenger Air Bag Module Loop 1 Resistance PID. • **Is the resistance between 1.31 and 4.29 ohms?**	**No** GO to C29 .
C29 CHECK THE PASSENGER AIR BAG MODULE LOOP 1 RESISTANCE PID WHILE CARRYING OUT A HARNESS TEST	
• **NOTE:** Do not remove the passenger air bag module from its mounted position at this time. • With the passenger air bag in its mounted position, continue monitoring the passenger air bag module loop 1 resistance PID while carrying out a harness test of the passenger air bag module circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness. • **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to C56 . **No** If the passenger air bag module loop 1 resistance PID is less than 1.31 ohms, GO to C30 . If the passenger air bag module loop 1 resistance PID is greater than 4.29 ohms, GO to C32 .
C30 CHECK THE PASSENGER AIR BAG MODULE LOOP 1 FOR LOW RESISTANCE	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2293 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2. • **Did the passenger air bag module loop 1 on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	**Yes** GO to C47 . **No** GO to C31 .
C31 CHECK THE RCM FOR LOW RESISTANCE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b.	**Yes** REPAIR circuit CR103 (GY/BU) and circuit RR103 (VT/GN). GO to C56 .

• Measure the resistance between RCM C310a pin 1 and C310a pin 2, component side.  A0041266 • **Is the resistance greater than 10,000 ohms?**	**No** GO to C49 .
C32 CHECK THE PASSENGER AIR BAG MODULE LOOP 1 FOR AN OPEN	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256. • Connect a jumper wire between passenger air bag module C256-4, circuit CR103 (GY/BU), harness side and C256-3, circuit RR103 (VT/GN), harness side. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2293 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module loop 1 circuits shorted together, a low resistance fault would normally be retrieved on loop 1. Loop 2 will show an open circuit fault due to the passenger air bag being disconnected. • **Did the passenger air bag module loop 1 on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**	**Yes** GO to C47 . **No** GO to C33 .
C33 CHECK THE PASSENGER AIR BAG MODULE LOOP 1 CIRCUITS FOR AN OPEN BETWEEN THE PASSENGER AIR BAG MODULE AND RCM	

• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from passenger air bag module C256. • Disconnect: RCM C310a and C310b. • Measure the resistance between RCM C310a-1, circuit CR103 (GY/BU), harness side and passenger air bag module C256-3, circuit CR103 (GY/BU), harness side; and between RCM C310a-2, circuit RR103 (VT/GN), harness side and passenger air bag module C256-4, circuit RR103 (VT/GN), harness side.  • **Are the resistances less than 0.5 ohm?**	**Yes** GO to C49 . **No** REPAIR circuit CR103 (GY/BU) or circuit RR103 (VT/GN). GO to C56 .
C34 CHECK THE PASSENGER AIR BAG MODULE LOOP 1 CIRCUITS FOR A SHORT TO GROUND	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2293 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2. • **Did the passenger air bag module loop 1 on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	**Yes** GO to C47 . **No** GO to C35 .
C35 CHECK CIRCUIT CR103 (GY/BU) AND CIRCUIT RR103 (VT/GN) FOR A SHORT TO GROUND BETWEEN THE RCM AND PASSENGER AIR BAG MODULE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b. • Measure the resistance between passenger air bag module C256-3, circuit CR103 (GY/BU), harness side and ground;	**Yes** GO to C49 . **No** Due to the shorting bar feature in the RCM electrical

and between passenger air bag module C256-4, circuit RR103 (VT/GN), harness side and ground.  A0090688 • **Are the resistances greater than 1,000,000 ohms?**	connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR103 (GY/BU) or circuit RR103 (VT/GN). GO to C56 .
C36 CHECK CIRCUIT CR103 (GY/BU) AND CIRCUIT RR103 (VT/GN) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND PASSENGER AIR BAG MODULE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256. • Disconnect: RCM C310a and C310b. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Measure the voltage between passenger air bag module C256-3, circuit CR103 (GY/BU), harness side and ground; and between passenger air bag module C256-4, circuit RR103 (VT/GN), harness side and ground.  A0088586 • **Are the voltages less than 0.2 volt?**	**Yes** GO to C49 . **No** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR103 (GY/BU) or circuit RR103 (VT/GN). GO to C56 .
C37 CHECK THE PASSENGER AIR BAG MODULE LOOP 2 RESISTANCE PID	
• Enter the following diagnostic mode on the diagnostic tool: DataLogger/PID. • Enter the following diagnostic mode on the diagnostic tool: Passenger Air Bag Module Loop 2 Resistance PID. • **Is the resistance between 1.31 and 4.29 ohms?**	**Yes** GO to C49 . **No** GO to C38 .
C38 CHECK THE PASSENGER AIR BAG MODULE LOOP 2 RESISTANCE PID WHILE CARRYING OUT A HARNESS TEST	
• **NOTE:** Do not remove the passenger air bag module from its mounted position at this time. • With the passenger air bag in its mounted position, continue monitoring the passenger air bag module loop 2 resistance PID while carrying out a harness test of the passenger air bag module circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to Wiring Diagrams Cell

the wire harness. • **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**	5 , Connector Repair Procedures for schematic and connector information. GO to C56 . **No** If the passenger air bag module loop 2 resistance PID is less than 1.31 ohms, GO to C39 . If the passenger air bag module loop 2 resistance PID is greater than 4.29 ohms, GO to C41 .
C39 CHECK THE PASSENGER AIR BAG MODULE LOOP 2 FOR LOW RESISTANCE	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2293 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2. • **Did the passenger air bag module loop 2 on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	**Yes** GO to C47 . **No** GO to C40 .
C40 CHECK THE RCM FOR LOW RESISTANCE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b. • Measure the resistance between RCM C310a pin 5 and C310a pin 6, component side.	**Yes** REPAIR circuit CR104 (YE/GY) and circuit RR104 (WH/BU). GO to C56 . **No** GO to C49 .



A0041276

- **Is the resistance greater than 10,000 ohms?**

C41 CHECK THE PASSENGER AIR BAG MODULE LOOP 2 FOR AN OPEN	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256. • Connect a jumper wire between passenger air bag module C256-1, circuit CR104 (YE/GY), harness side and C256-2, circuit RR104 (WH/BU), harness side. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2293 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module loop 2 circuits shorted together, a low resistance fault would normally be retrieved on loop 2. Loop 1 will show an open circuit fault due to the passenger air bag module being disconnected. • **Did the passenger air bag module loop 2 on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**	**Yes** GO to C47 . **No** GO to C42 .
C42 CHECK PASSENGER AIR BAG MODULE LOOP 2 CIRCUITS FOR AN OPEN BETWEEN THE PASSENGER AIR BAG MODULE AND RCM	
• Key in OFF position.	**Yes**

• Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from passenger air bag module C256. • Disconnect: RCM C310a and C310b. • Measure the resistance between RCM C310a-5, circuit CR104 (YE/GY), harness side and passenger air bag module C256-1, circuit CR104 (YE/GY), harness side; and between RCM C310a-6, circuit RR104 (WH/BU), harness side and passenger air bag module C256-2, circuit RR104 (WH/BU), harness side.  • **Are the resistances less than 0.5 ohm?**	GO to C49 . **No** REPAIR circuit CR104 (YE/GY) or circuit RR104 (WH/BU). GO to C56 .
C43 CHECK THE PASSENGER AIR BAG MODULE LOOP 2 CIRCUITS FOR A SHORT TO GROUND	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2293 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2. • **Did the passenger air bag module loop 2 on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	**Yes** GO to C47 . **No** GO to C44 .
C44 CHECK CIRCUIT CR104 (YE/GY) AND CIRCUIT RR104 (WH/BU) FOR A SHORT TO GROUND BETWEEN THE RCM AND PASSENGER AIR BAG MODULE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b. • Measure the resistance between passenger air bag module C256-1, circuit CR104 (YE/GY), harness side and ground; and between passenger air bag module C256-2, circuit	**Yes** GO to C49 . **No** Due to the shorting bar feature in the RCM electrical connector, the fault can exist

RR104 (WH/BU), harness side and ground.  A0090687 • **Are the resistances greater than 1,000,000 ohms?**	in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR104 (YE/GY) or circuit RR104 (WH/BU). GO to C56 .
C45 CHECK CIRCUIT CR104 (YE/GY) AND CIRCUIT RR104 (WH/BU) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND PASSENGER AIR BAG MODULE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256. • Disconnect: RCM C310a and C310b. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Measure the voltage between passenger air bag module C256-1, circuit CR104 (YE/GY), harness side and ground; and between passenger air bag module C256-2, circuit RR104 (WH/BU), harness side and ground.  A0088583 • **Are the voltages less than 0.2 volt?**	**Yes** GO to C49 . **No** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR104 (YE/GY) or circuit RR104 (WH/BU). GO to C56 .
C46 CONFIRM THE DRIVER AIR BAG MODULE FAULT	
NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the on-demand self-test. If not, erroneous DTCs will be recorded. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Install the driver air bag module. Refer to Driver Air Bag Module . • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2293 Fault PIDs.	**Yes** INSTALL a new driver air bag module. REFER to Driver Air Bag Module . GO to C56 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, GO to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were

• **Was DTC B2293 retrieved during the on-demand self test?**	disconnected. For driver air bag module loop 1 or loop 2 with a low resistance fault, GO to C50 . For driver air bag module loop 1 or loop 2 with an open circuit fault, GO to C50 . For driver air bag module loop 1 or loop 2 with a short to ground fault, GO to C51 . For driver air bag module loop 1 or loop 2 with a short to battery fault, GO to C53 .
C47 CONFIRM THE PASSENGER AIR BAG MODULE FAULT	
NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Passenger Air Bag Module C256 (if previously disconnected). • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2293 Fault PIDs. • **Was DTC B2293 retrieved during the on-demand self test?**	**Yes** INSTALL a new passenger air bag module. REFER to Passenger Air Bag Module . GO to C56 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, GO to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. For passenger air bag module loop 1 or loop 2 with a low resistance fault, GO to C50 . For passenger air bag module loop 1 or loop 2 with an open circuit fault, GO to C50 . For passenger air bag module loop 1 or loop 2 with a short to ground fault, GO to C52 . For passenger air bag module loop 1 or loop 2 with a short to battery fault, GO to C54 .
C48 CONFIRM THE CLOCKSPRING FAULT	
NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying	**Yes** INSTALL a new clockspring.

out the on-demand self test. If not, erroneous DTCs will be recorded. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Clockspring C218a. • Install the driver air bag module. Refer to Driver Air Bag Module . • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2293 Fault PIDs. • **Was DTC B2293 retrieved during the on-demand self test?**	REFER to Clockspring . GO to C56 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, GO to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. For driver air bag module loop 1 or loop 2 with a low resistance fault, GO to C50 . For driver air bag module loop 1 or loop 2 with an open circuit fault, GO to C50 . For driver air bag module loop 1 or loop 2 with a short to ground fault, GO to C51 . For driver air bag module loop 1 or loop 2 with a short to battery fault, GO to C53 .
C49 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • If previously removed, install the driver air bag module. Refer to Driver Air Bag Module . • Connect: Clockspring C218a (if previously disconnected). • Connect: Passenger Air Bag Module C256 (if previously disconnected). • Connect: RCM C310a and C310b. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2293 Fault PIDs. • **Was DTC B2293 retrieved during the on-demand self test?**	**Yes** INSTALL a new RCM and CARRY OUT programmable module installation (PMI). REFER to Restraints Control Module (RCM) in this section. GO to C56 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, GO to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. For driver air bag module loop 1 with a low resistance fault, GO to C50 . For driver air bag module

	loop 1 with an open circuit fault, GO to C50 . For driver air bag module loop 1 with a short to ground fault, GO to C51 . For driver air bag module loop 1 with a short to battery fault, GO to C53 . For driver air bag module loop 2 with a low resistance fault, GO to C50 . For driver air bag module loop 2 with an open circuit fault, GO to C50 . For driver air bag module loop 2 with a short to ground fault, GO to C51 . For driver air bag module loop 2 with a short to battery fault, GO to C53 . For passenger air bag module loop 1 with a low resistance fault, GO to C50 . For passenger air bag module loop 1 with an open circuit fault, GO to C50 . For passenger air bag module loop 1 with a short to ground fault, GO to C52 . For passenger air bag module loop 1 with a short to battery fault, GO to C54 . For passenger air bag module loop 2 with a low resistance fault, GO to C50 . For passenger air bag module loop 2 with an open circuit fault, GO to C50 . For passenger air bag module loop 2 with a short to ground fault, GO to C52 . For passenger air bag module loop 2 with a short to battery fault, GO to C54 .
C50 CHECK THE DRIVER OR PASSENGER AIR BAG MODULE FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT	
• If the fault PID was reported for the driver air bag module	**Yes**

loop 1 or loop 2, monitor the following on the scan tool: ▪ driver air bag module loop 1 resistance PID. ▪ driver air bag module loop 2 resistance PID. • If the fault PID was reported for the passenger air bag module loop 1 or loop 2, monitor the following on the scan tool: ▪ passenger air bag module loop 1 resistance PID. ▪ passenger air bag module loop 2 resistance PID. • **NOTE:** A resistance PID that reads between 0.9 and 1.31 ohms or between 4.29 and 5.0 ohms may or may not set an on-demand DTC yet indicates a strong potential of an intermittent fault condition. Make sure to thoroughly check wire harness(es), connectors and terminals as they are the likely source of the fault condition. • **NOTE:** Do not remove the driver or passenger air bag module from its mounted position at this time. • With the driver or passenger air bag in its mounted position, attempt to recreate the fault by wiggling connectors (including any inline connectors), and flexing the wire harness, tilting and rotating the steering wheel frequently. • **Does any driver or passenger air bag resistance PID indicate less than 1.31 ohms or greater than 4.29 ohms?**	DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to C56 . **No** GO to C55 .
C51 CHECK THE DRIVER AIR BAG MODULE CIRCUITS FOR AN INTERMITTENT SHORT TO GROUND FAULT	
• Monitor the driver air bag module loop 1 and loop 2 short to ground on-demand fault PIDs. • **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update. • **NOTE:** Do not remove the driver air bag module from its mounted position at this time. • With the driver air bag in its mounted position, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness, tilting and rotating the steering wheel frequently. • **Does any driver air bag module short to ground fault PID indicate a fault is present?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to C56 . **No** GO to C55 .
C52 CHECK THE PASSENGER AIR BAG MODULE CIRCUITS FOR AN INTERMITTENT SHORT TO GROUND FAULT	
• Key in ON position. • **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update. • Monitor the passenger air bag module loop 1 and loop 2 short to ground on-demand fault PIDs. • **NOTE:** Do not remove the passenger air bag module from its mounted position at this time. • With the passenger air bag in its mounted position, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness. • **Does any passenger air bag module short to ground fault PID indicate a fault is present?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to C56 . **No** GO to C55 .
C53 CHECK THE DRIVER AIR BAG MODULE CIRCUITS FOR AN INTERMITTENT SHORT TO BATTERY FAULT	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Air Bag Module in this section.	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell

• Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update. • Monitor the driver air bag module loop 1 and loop 2 short to battery on-demand fault PIDs. • Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness, tilting and rotating the steering wheel frequently. • **Does any driver air bag module short to battery fault PID indicate a fault is present?**	5 , Connector Repair Procedures for schematic and connector information. GO to C56 . **No** GO to C55 .
C54 CHECK THE PASSENGER AIR BAG MODULE CIRCUITS FOR AN INTERMITTENT SHORT TO BATTERY FAULT	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update. • Monitor the passenger air bag module loop 1 and loop 2 short to battery on-demand fault PIDs. • **NOTE:** Do not remove the passenger air bag module from its mounted position at this time. • With the passenger air bag in its mounted position, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness. • **Does any passenger air bag module short to battery fault PID indicate a fault is present?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to C56 . **No** GO to C55 .
C55 CHECK THE HARNESS AND CONNECTORS	

• Key in OFF position.
• Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• If the fault PID was reported for the driver air bag:
  ▪ remove the driver air bag module.
  ▪ inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
  ▪ inspect wire harness for any damage, pinched, cut or pierced wires.
• If the fault PID was reported for the passenger air bag:
  ▪ disconnect the passenger air bag module C256.
  ▪ inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
  ▪ inspect wire harness for any damage, pinched, cut or pierced wires.
• **Were any concerns found?**
	Yes
	REPAIR as necessary.
	
	Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information.
	
	GO to C56 .
	
	No
	The fault is not present and cannot be recreated at this time. GO to C56 .

C56 CHECK FOR ADDITIONAL DTCs	
• Refer to the continuous memory DTCs recorded during Step C1. • **Were any continuous memory DTCs retrieved during Step C1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control

	Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. If previously directed to depower the system, REPOWER the system. REFER to Supplemental Restraint System (SRS) Depowering and Repowering in this section. PROVE OUT the system. CLEAR all RCM DTCs.

Pinpoint Test D: DTC B2294 — Restraint System — Curtain Fault

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors all safety canopy module circuits for faults. The RCM will set a diagnostic trouble code (DTC) if a short to battery or short to ground fault is detected. The RCM will also set a DTC if the loop resistance is less than 0.9 ohm or greater than 5.0 ohms. The normal expected resistance range is 1.31 to 4.29 ohms. If a loop resistance is between 0.9 and 1.31 or between 4.29 and 5.0 ohms, there exists a strong potential for an intermittent fault. If the RCM detects a fault on any of the safety canopy module circuits, it will store DTC B2294 in memory and illuminate the air bag warning indicator.

Fault Conditions

The RCM monitors for the following fault conditions:

- Loop resistance less than 0.9 ohm (Low resistance)
- Loop resistance greater than 5.0 ohms (Circuit open)
- Circuit short to voltage
- Circuit short to ground

Possible Causes

A safety canopy module fault can be caused by:

- damaged wiring, terminals or connectors.
- a faulty safety canopy module.
- RCM is faulted.

PINPOINT TEST D: DTC B2294 — RESTRAINT SYSTEM — CURTAIN FAULT

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.

WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment.

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough Inspection and Verification before proceeding with the Pinpoint Test.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
D1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2294 Fault PIDs. • **Was on-demand DTC B2294 retrieved?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Using the fault PIDs recorded, GO to the appropriate pinpoint test step. For driver safety canopy with a low resistance fault, GO to D2 . For driver safety canopy with an open circuit fault, GO to D2 . For driver safety canopy with a short to ground fault, GO to D9 . For driver safety canopy with a short to battery fault, GO to D11 . For passenger safety canopy with a low resistance fault, GO to D12 . For passenger safety canopy with an open circuit fault, GO to D12 . For passenger safety canopy with a short to ground fault, GO to D19 . For passenger safety canopy with a short to battery fault, GO to D21 . **No** This is an intermittent fault when present as a continuous memory DTC only (DTC not

	retrieved on demand). The fault condition is not present at this time. Using the fault PIDs recorded, GO to the appropriate pinpoint test step. For driver or passenger safety canopy with a low resistance or open circuit, GO to D24 . For driver or passenger safety canopy with a short to ground fault, GO to D26 . For driver or passenger safety canopy with a short to battery fault, GO to D27 .
D2 CHECK THE DRIVER SAFETY CANOPY MODULE RESISTANCE PID	
• Enter the following diagnostic mode on the diagnostic tool: DataLogger/PID. • Enter the following diagnostic mode on the diagnostic tool: Driver Safety Canopy Resistance PID . • **Is the resistance between 1.31 and 4.29 ohms?**	**Yes** GO to D23 . **No** GO to D3 .
D3 CHECK THE DRIVER SAFETY CANOPY MODULE RESISTANCE PID WHILE CARRYING OUT A HARNESS TEST	
• Continue monitoring the driver safety canopy resistance PID while carrying out a harness test of the driver safety canopy circuits and accessible connectors (including any inline connectors) by wiggling connectors and flexing the wire harness. • **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to D28 . **No** If the driver safety canopy resistance PID is less than 1.31 ohm, GO to D4 . If the driver safety canopy resistance PID is greater than 4.29 ohms, GO to D7 .
D4 CHECK THE DRIVER SAFETY CANOPY MODULE FOR LOW RESISTANCE	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Canopy C9006.	**Yes** GO to D22 . **No** GO to D5 .

• Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2294 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2294 on-demand fault PIDs with the driver safety canopy disconnected, an open circuit fault would normally be retrieved. • **Did the driver safety canopy on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	
D5 CHECK CIRCUIT CR109 (BN/BU) AND CIRCUIT RR109 (BU/GN) FOR LOW RESISTANCE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Measure the resistance between driver safety canopy C9006-1, circuit CR109 (BN/BU), harness side and C9006-3, circuit RR109 (BU/GN), harness side.  DR1050-A • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D23. **No** GO to D6.
D6 CHECK THE RCM FOR LOW RESISTANCE	
• Disconnect: RCM C310a and C310b. • Measure the resistance between RCM C310b pin 21, component side, and C310b pin 22, component side.  N0036928 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR circuit CR109 (BN/BU) and circuit RR109 (BU/GN). GO to D28. **No** GO to D23.
D7 CHECK THE DRIVER SAFETY CANOPY MODULE FOR AN OPEN	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.	**Yes** GO to D22. **No** GO to D8.

• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Canopy C9006. • Connect a jumper wire between driver safety canopy C9006-1, circuit CR109 (BN/BU), harness side and C9006-3, circuit RR109 (BU/GN), harness side. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2294 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2294 on-demand fault PIDs with the driver safety canopy circuits shorted together, a low resistance fault would normally be retrieved. • **Did the driver safety canopy on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**	
D8 CHECK CIRCUIT CR109 (BN/BU) AND CIRCUIT RR109 (BU/GN) FOR AN OPEN BETWEEN THE RCM AND DRIVER SAFETY CANOPY MODULE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from the driver safety canopy C9006. • Disconnect: RCM C310a and C310b. • Measure the resistance between RCM C310b-21, circuit CR109 (BN/BU), harness side and driver safety canopy C9006-1, circuit CR109 (BN/BU), harness side; and between RCM C310b-22, circuit RR109 (BU/GN), harness side and driver safety canopy C9006-3, circuit RR109 (BU/GN), harness side.  • **Are the resistances less than 0.5 ohm?**	**Yes** GO to D23 . **No** REPAIR circuit CR109 (BN/BU) or circuit RR109 (BU/GN). GO to D28 .
D9 CHECK THE DRIVER SAFETY CANOPY MODULE FOR A SHORT TO GROUND	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Canopy C9006.	**Yes** GO to D22 . **No** GO to D10 .

• Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2294 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2294 on-demand fault PIDs with the driver safety canopy disconnected, an open circuit fault would normally be retrieved. • **Did the driver safety canopy on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	
D10 CHECK CIRCUIT CR109 (BN/BU) AND CIRCUIT RR109 (BU/GN) FOR A SHORT TO GROUND BETWEEN THE RCM AND DRIVER SAFETY CANOPY MODULE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b. • Measure the resistance between driver safety canopy C9006-1, circuit CR109 (BN/BU), harness side and ground; and between driver safety canopy C9006-3, circuit RR109 (BU/GN), harness side and ground.  • **Are the resistances greater than 1,000,000 ohms?**	**Yes** GO to D23 . **No** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR109 (BN/BU) or circuit RR109 (BU/GN). GO to D28 .
D11 CHECK CIRCUIT CR109 (BN/BU) AND CIRCUIT RR109 (BU/GN) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND DRIVER SAFETY CANOPY MODULE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Canopy C9006. • Disconnect: RCM C310a and C310b. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Measure the voltage between driver safety canopy C9006-1, circuit CR109 (BN/BU), harness side and ground; and between driver safety canopy C9006-3, circuit RR109 (BU/GN), harness side and ground.	**Yes** GO to D23 . **No** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR109 (BN/BU) or circuit RR109 (BU/GN). GO to D28 .

 • **Are the voltages less than 0.2 volt?**	
D12 CHECK THE PASSENGER SAFETY CANOPY MODULE RESISTANCE PID	
• Enter the following diagnostic mode on the diagnostic tool: DataLogger/PID. • Enter the following diagnostic mode on the diagnostic tool: Passenger Safety Canopy Resistance PID . • **Is the resistance between 1.31 and 4.29 ohms?**	**Yes** GO to D23 . **No** GO to D13 .
D13 CHECK THE PASSENGER SAFETY CANOPY MODULE RESISTANCE PID WHILE CARRYING OUT A HARNESS TEST	
• Continue monitoring the passenger safety canopy resistance PID while carrying out a harness test of the passenger safety canopy circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness. • **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to D28 . **No** If the passenger safety canopy resistance PID is less than 1.31 ohm, GO to D14 . If the passenger safety canopy resistance PID is greater than 4.29 ohms, GO to D17 .
D14 CHECK THE PASSENGER SAFETY CANOPY MODULE FOR LOW RESISTANCE	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Safety Canopy C9007. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool:	**Yes** GO to D22 . **No** GO to D15 .

Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2294 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2294 on-demand fault PIDs with the passenger safety canopy disconnected, an open circuit fault would normally be retrieved. • **Did the passenger safety canopy on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	
D15 CHECK CIRCUIT CR111 (BN/WH) AND CIRCUIT RR111 (YE/VT) FOR LOW RESISTANCE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Measure the resistance between passenger safety canopy module C9007-1, circuit CR111 (BN/WH), harness side and C9007-3, circuit RR111 (YE/VT), harness side.  DR1050-A • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D23 . **No** GO to D16 .
D16 CHECK THE RCM FOR LOW RESISTANCE	
• Disconnect: RCM C310a and C310b. • Measure the resistance between RCM C310b pin 1, component side, and C310b pin 2, component side.  N0036924 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR circuit CR111 (BN/WH) and circuit RR111 (YE/VT). GO to D28 . **No** GO to D23 .
D17 CHECK THE PASSENGER SAFETY CANOPY MODULE FOR AN OPEN	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Safety Canopy C9007. • Connect a jumper wire between passenger safety canopy	**Yes** GO to D22 . **No** GO to D18 .

C9007-1, circuit CR111 (BN/WH), harness side and C9007-3, circuit RR111 (YE/VT), harness side. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2294 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2294 on-demand fault PIDs with the passenger safety canopy circuits shorted together, a low resistance fault would normally be retrieved. • **Did the passenger safety canopy on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**	
D18 CHECK CIRCUIT CR111 (BN/WH) AND CIRCUIT RR111 (YE/VT) FOR AN OPEN BETWEEN THE RCM AND PASSENGER SAFETY CANOPY MODULE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from the passenger safety canopy C9007. • Disconnect: RCM C310a and C310b. • Measure the resistance between RCM C310b-1, circuit CR111 (BN/WH), harness side and passenger safety canopy module C9007-1, circuit CR111 (BN/WH), harness side; and between RCM C310b-2, circuit RR111 (YE/VT), harness side and passenger safety canopy module C9007-3, circuit RR111 (YE/VT), harness side.  • **Are the resistances less than 0.5 ohm?**	**Yes** GO to D23. **No** REPAIR circuit CR111 (BN/WH) or circuit RR111 (YE/VT). GO to D28.
D19 CHECK THE PASSENGER SAFETY CANOPY MODULE FOR A SHORT TO GROUND	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Safety Canopy C9007. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool:	**Yes** GO to D22. **No** GO to D20.

Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2294 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2294 on-demand fault PIDs with the passenger safety canopy disconnected, an open circuit fault would normally be retrieved. • **Did the passenger safety canopy on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	
D20 CHECK CIRCUIT CR111 (BN/WH) AND CIRCUIT RR111 (YE/VT) FOR A SHORT TO GROUND BETWEEN THE RCM AND PASSENGER SAFETY CANOPY MODULE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b. • Measure the resistance between passenger safety canopy C9007-1, circuit CR111 (BN/WH), harness side and ground; and between passenger safety canopy C9007-3, circuit RR111 (YE/VT), harness side and ground.  N0045012 • **Are the resistances greater than 1,000,000 ohms?**	**Yes** GO to D23 . **No** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR111 (BN/WH) or circuit RR111 (YE/VT). GO to D28 .
D21 CHECK CIRCUIT CR111 (BN/WH) AND CIRCUIT RR111 (YE/VT) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND PASSENGER SAFETY CANOPY MODULE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Safety Canopy C9007. • Disconnect: RCM C310a and C310b. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Measure the voltage between passenger safety canopy C9007-1, circuit CR111 (BN/WH), harness side and ground; and between passenger safety canopy C9007-3, circuit RR111 (YE/VT), harness side and ground.  N0045011	**Yes** GO to D23 . **No** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR111 (BN/WH) or circuit RR111 (YE/VT). GO to D28 .

• **Are the voltages less than 0.2 volt?**	
D22 CONFIRM THE SAFETY CANOPY MODULE FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Affected Safety Canopy C9006 (Driver) C9007 (Passenger). • Connect: RCM C310a and C310b. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2294 Fault PIDs. • **Was on-demand DTC B2294 retrieved?**	**Yes** INSTALL a new driver or passenger safety canopy. REFER to Safety Canopy Module . GO to D28 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, GO to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. For driver or passenger safety canopy with a low resistance or open circuit, GO to D24 . For driver or passenger safety canopy with a short to ground fault, GO to D26 . For driver or passenger safety canopy with a short to battery fault, GO to D27 .
D23 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Key in OFF position. • If previously directed to disconnect any SRS component(s): ▪ depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. ▪ connect all previously disconnected restraint system component(s), including RCM C310a and C310b. ▪ repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2294 Fault PIDs. • **Was on-demand DTC B2294 retrieved?**	**Yes** INSTALL a new RCM and CARRY OUT programmable module installation (PMI). REFER to Restraints Control Module (RCM) in this section. GO to D28 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, GO to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. For driver or passenger safety canopy with a low resistance or open circuit, GO to D24 . For driver or passenger safety

	canopy with a short to ground fault, GO to D26 . For driver or passenger safety canopy with a short to battery fault, GO to D27 .

D24 CHECK FOR AN INTERMITTENT SAFETY CANOPY MODULE LOW RESISTANCE OR OPEN CIRCUIT FAULT
 	
• If the fault PID was reported for the driver safety canopy, monitor the following on the scan tool:
  ▪ driver safety canopy resistance PID.
• If the fault PID was reported for the passenger safety canopy, monitor the following on the scan tool:
  ▪ passenger safety canopy resistance PID.
• **NOTE:** A resistance PID that reads between 0.9 and 1.31 ohms or between 4.29 and 5.0 ohms may or may not set an on-demand DTC yet indicates a strong potential of an intermittent fault condition. Make sure to thoroughly check wire harness(es), connectors and terminals as they are the likely source of the fault condition.
• Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness.
• **Does any safety canopy resistance PID indicate less than 1.31 ohms or greater than 4.29 ohms?**
	Yes
	DEPOWER the SRS and REPAIR as necessary.
	
	Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information.
	
	GO to D28 .
	
	No
	GO to D25 .

D25 CHECK THE HARNESS AND CONNECTORS
 	
• Key in OFF position.
• Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect the affected safety canopy module C9006 (driver) or C9007 (passenger):
  ▪ inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
  ▪ inspect wire harness for any damage, pinched, cut or pierced wires.
• **Were any concerns found?**
	Yes
	REPAIR as necessary.
	
	Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information.
	
	GO to D28 .
	
	No
	The fault is not present and cannot be recreated at this time. GO to D28 .

D26 CHECK FOR AN INTERMITTENT SAFETY CANOPY MODULE CIRCUIT SHORT TO GROUND FAULT
 	
• Enter the following diagnostic mode on the diagnostic tool: DataLogger/PID.
• If the fault PID was reported for the driver safety canopy:
  ▪ monitor the driver safety canopy short to ground on-demand fault PID on the scan tool.
• If the fault PID was reported for the passenger safety canopy:
  ▪ monitor the passenger safety canopy short to ground on-demand fault PID on the scan tool.
• **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to a 2 second delay for the scan tool display to update.
• Attempt to recreate the fault by wiggling connectors (including any inline connectors), and flexing the wire harness.
• **Does any safety canopy on-demand fault PID indicate a fault is present?**
	Yes
	DEPOWER the SRS and REPAIR as necessary.
	
	Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information.
	
	GO to D28 .
	
	No
	The fault is not present and cannot be recreated at this time. GO to D28 .

D27 CHECK FOR AN INTERMITTENT SAFETY CANOPY MODULE CIRCUIT SHORT TO BATTERY FAULT	

• Key in OFF position.
• Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• If the fault PID was reported for the driver safety canopy,
  ▪ disconnect the driver safety canopy module C9006.
• If the fault PID was reported for the passenger safety canopy,
  ▪ disconnect the passenger safety canopy module C9007.
• Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Key in ON position.
• **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to a 2 second delay for the scan tool display to update.
• Monitor the driver or passenger safety canopy short to battery on-demand fault PIDs on the scan tool.
• Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness.
• **Does any safety canopy on-demand fault PID indicate a fault is present?**
	Yes
	DEPOWER the SRS and REPAIR as necessary.
	
	Refer to Wiring Diagrams Cell 5, Connector Repair Procedures for schematic and connector information.
	
	GO to D28.
	
	No
	The fault is not present and cannot be recreated at this time. GO to D28.

D28 CHECK FOR ADDITIONAL DTCs	
• Refer to the continuous memory DTCs recorded during Step D1. • **Were any continuous memory DTCs retrieved during Step D1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. If previously directed to depower the system, REPOWER the system. REFER to Supplemental Restraint System (SRS) Depowering and Repowering in this section. PROVE OUT the system. CLEAR all RCM DTCs.

Pinpoint Test E: DTC B2295 — Restraint System — Side Air Bag Fault

Refer to Wiring Diagrams Cell 46, Supplemental Restraint System for schematic and connector information.

Normal Operation

A side air bag module provides protection of the thorax area (between the neck and abdomen) of the body, working in conjunction with the head protection provided by a safety canopy module. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The restraints control module (RCM) monitors the side air bag module circuits for faults. The RCM will

set a diagnostic trouble code (DTC) if a short to battery or short to ground fault is detected. The RCM will also set a DTC if the loop resistance is less than 0.9 ohm or greater than 5.0 ohms. The normal expected resistance range is 1.31 to 4.29 ohms. If a loop resistance is between 0.9 and 1.31 or between 4.29 and 5.0 ohms, there exists a strong potential for an intermittent fault. If the RCM detects one of the following faults on any of the side air bag circuits, it will store DTC B2295 in memory and illuminate the air bag warning indicator.

Fault Conditions

The RCM monitors for the following fault conditions:

- Loop resistance less than 0.9 ohm (Low resistance)
- Loop resistance greater than 5.0 ohms (Circuit open)
- Circuit short to voltage
- Circuit short to ground

Possible Causes

A side air bag fault can be caused by:

- damaged wiring, terminals or connectors.
- a faulted side air bag module.
- a faulted RCM.

PINPOINT TEST E: DTC B2295 — RESTRAINT SYSTEM — SIDE AIR BAG FAULT

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

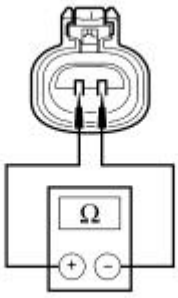
NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough Inspection and Verification before proceeding with the Pinpoint Test.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
E1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2295 Fault PIDs. • **Was on-demand DTC B2295 retrieved?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test.

	Using the fault PIDs recorded, GO to the appropriate pinpoint test step. For driver side air bag low resistance fault, GO to E2 . For driver side air bag with an open circuit fault, GO to E2 . For driver side air bag with a short to ground fault, GO to E9 . For driver side air bag with a short to battery fault, GO to E11 . For passenger side air bag with a low resistance fault, GO to E12 . For passenger side air bag with an open circuit fault, GO to E12 . For passenger side air bag with a short to ground fault, GO to E19 . For passenger side air bag with a short to battery fault, GO to E21 . **No** This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Using the fault PIDs recorded, GO to the appropriate pinpoint test step. For driver or passenger side air bag with a low resistance, open circuit or short to ground fault, GO to E24 . For driver or passenger side air bag with a short to ground fault, GO to E26 . For driver or passenger side air bag with a short to battery fault, GO to E27 .
E2 CHECK THE DRIVER SIDE AIR BAG MODULE RESISTANCE PID	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/PID. • Enter the following diagnostic mode on the diagnostic tool:	**Yes** GO to E23 . **No**

Driver Side Air Bag Resistance PID . • **Is the resistance between 1.31 and 4.29 ohms**	GO to E3 .
E3 CHECK THE DRIVER SIDE AIR BAG RESISTANCE PID WHILE CARRYING OUT A HARNESS TEST	
• Continue monitoring the driver side air bag resistance PID while carrying out a harness test of the driver side air bag circuits and accessible connectors (including any inline connectors) by wiggling connectors and flexing the wire harness. • **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to E28 . **No** If the driver side air bag resistance PID is less than 1.31 ohms, GO to E4 . If the driver safety canopy resistance PID is greater than 4.29 ohms, GO to E7 .
E4 CHECK THE DRIVER SIDE AIR BAG MODULE FOR LOW RESISTANCE	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Side Air Bag Module C3051. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2295 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2295 on-demand fault PIDs with the driver side air bag disconnected, an open circuit fault would normally be retrieved. • **Did the driver side air bag on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	**Yes** GO to E22 . **No** GO to E5 .
E5 CHECK CIRCUIT CR110 (GN/BN) AND CIRCUIT RR110 (GY/OG) FOR LOW RESISTANCE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Measure the resistance between driver side air bag C3051-1, circuit CR110 (GN/BN), harness side and C3052-2, circuit RR110 (GY/OG), harness side.	**Yes** GO to E22 . **No** GO to E6 .



- **Is the resistance greater than 10,000 ohms?**

E6 CHECK THE RCM FOR LOW RESISTANCE	
• Disconnect: RCM C310a and C310b. • Measure the resistance between RCM C310b pin 7, component side, and C310b pin 8, component side.  • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR circuit CR110 (GN/BN) and circuit RR110 (GY/OG). GO to E25 . **No** GO to E23 .
E7 CHECK THE DRIVER SIDE AIR BAG MODULE FOR AN OPEN	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Side Air Bag Module C3051. • Connect a jumper wire between driver side air bag C3051-1, circuit CR110 (GN/BN), harness side and C3051-2, circuit RR110 (GY/OG), harness side. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2295 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2295 on-demand fault PIDs with the driver side air bag module circuits shorted together, a low resistance fault would normally be retrieved. • **Did the driver side air bag on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**	**Yes** GO to E22 . **No** GO to E8 .
E8 CHECK CIRCUIT CR110 (GN/BN) AND CIRCUIT RR110	

(GY/OG) FOR AN OPEN BETWEEN THE RCM AND DRIVER SIDE AIR BAG MODULE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from the driver side air bag C3051. • Disconnect: RCM C310a and C310b. • Measure the resistance between RCM C310b-8, circuit CR110 (GN/BN), harness side and driver side air bag C3051-1, circuit CR110 (GN/BU), harness side; and between RCM C310b-7, circuit RR110 (GY/OG), harness side and driver side air bag C3051-2, circuit RR110 (GY/OG), harness side.  • **Are the resistances less than 0.5 ohm?**	**Yes** GO to E23 . **No** REPAIR circuit CR110 (GN/BN) or circuit RR110 (GY/OG). GO to E28 .
E9 CHECK THE DRIVER SIDE AIR BAG MODULE FOR A SHORT TO GROUND	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Side Air Bag Module C3051. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2295 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2295 on-demand fault PIDs with the driver side air bag module disconnected, an open circuit fault would normally be retrieved. • **Did the driver side air bag on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	**Yes** GO to E22 . **No** GO to E10 .
E10 CHECK CIRCUIT CR109 (BN/BU) AND CIRCUIT RR109 (BU/GN) FOR A SHORT TO GROUND BETWEEN THE RCM AND DRIVER SIDE AIR BAG MODULE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b. • Measure the resistance between driver side air bag C3051-1, circuit CR110 (GN/BN), harness side and ground; and	**Yes** GO to E23 . **No** Due to the shorting bar feature in the RCM electrical

between driver side air bag C3051-2, circuit RR110 (GY/OG), harness side and ground.  N0057647 • **Is the resistance greater than 1,000,000 ohms?**	connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR110 (GN/BN) or circuit RR110 (GY/OG). GO to E28 .
E11 CHECK CIRCUIT CR110 (GN/BN) AND CIRCUIT RR110 (GY/OG) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND DRIVER SIDE AIR BAG MODULE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Side Air Bag Module C3051. • Disconnect: Driver Safety Belt Buckle Pretensioner C3201. • Disconnect: RCM C310a and C310b. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Measure the voltage between driver side air bag C3051-1, circuit CR110 (GN/BN), harness side and ground; and between driver side air bag C3051-2, circuit RR110 (GY/OG), harness side and ground.  N0057646 • **Are the voltages less than 0.2 volt?**	**Yes** GO to E23 . **No** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR110 (GN/BN) or circuit RR110 (GY/OG). GO to E28 .
E12 CHECK THE PASSENGER SIDE AIR BAG MODULE RESISTANCE PID	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/PID. • Enter the following diagnostic mode on the diagnostic tool: Passenger Side Air Bag Resistance PID . • **Is the resistance between 1.31 and 4.29 ohms?**	**Yes** GO to E23 . **No** GO to E13 .
E13 CHECK THE PASSENGER SIDE AIR BAG RESISTANCE PID WHILE CARRYING OUT A HARNESS TEST	
• Continue monitoring the passenger side air bag resistance PID while carrying out a harness test of the passenger side air bag circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness.	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed.

• **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**	Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to E28 . **No** If the passenger side air bag resistance PID is less than 1.31 ohms, GO to E14 . If the passenger side air bag resistance PID is greater than 4.29 ohms, GO to E17 .
E14 CHECK THE PASSENGER SIDE AIR BAG MODULE FOR LOW RESISTANCE	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Side Air Bag Module C3052. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2295 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2295 on-demand fault PIDs with the passenger side air bag module disconnected, an open circuit faults would normally be retrieved. • **Did the passenger side air bag on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	**Yes** GO to E22 . **No** GO to E15 .
E15 CHECK CIRCUIT CR112 (BU/GY) AND CIRCUIT RR112 (GN/OG) FOR LOW RESISTANCE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Measure the resistance between passenger side air bag C3052-1, circuit CR112 (BU/GY), harness side and C3052-2, circuit RR112 (GN/OG), harness side.	**Yes** GO to E23 . **No** GO to E16 .

 A0091743 • **Is the resistance greater than 10,000 ohms?**	
E16 CHECK THE RCM FOR LOW RESISTANCE	**Yes** REPAIR circuit CR112 (BU/GY) and circuit RR112 (GN/OG). GO to E28 . **No** GO to E23 .
• Disconnect: RCM C310a and C310b. • Measure the resistance between RCM C310b pin 9, component side, and C310b pin 10, component side.  N0036915 • **Is the resistance greater than 10,000 ohms?**	
E17 CHECK THE PASSENGER SIDE AIR BAG MODULE FOR AN OPEN	**Yes** GO to E22 . **No** GO to E18 .
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Side Air Bag Module C3052. • Connect a jumper wire between passenger side air bag C3052-1, circuit CR112 (BU/GY), harness side and C3052-2, circuit RR112 (GN/OG), harness side. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2295 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2295 on-demand fault PIDs with the passenger side air bag circuits shorted together, a low resistance fault would normally be retrieved. • **Did the passenger side air bag on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**	
E18 CHECK CIRCUIT CR112 (BU/GY) AND CIRCUIT RR111 (GN/OG) FOR AN OPEN BETWEEN THE RCM AND	

PASSENGER SIDE AIR BAG MODULE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from the passenger side air bag C3052. • Disconnect: RCM C310a and C310b. • Measure the resistance between RCM C310b-9, circuit CR112 (BU/GY), harness side and passenger side air bag module C3052-1, circuit CR112 (BU/GY), harness side; and between RCM C310b-10, circuit RR112 (GN/OG), harness side and passenger side air bag module C3052-2, circuit RR112 (GN/OG), harness side.  N0057645 • **Are the resistances less than 0.5 ohm?**	**Yes** GO to E23 . **No** REPAIR circuit CR112 (BU/GY) or circuit RR112 (GN/OG). GO to E28 .
E19 CHECK THE PASSENGER SIDE AIR BAG MODULE FOR A SHORT TO GROUND	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Side Air Bag Module C3052. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2295 Fault PIDs. • **DIAGNOSTIC TIP:** When viewing DTC B2295 on-demand fault PIDs with the passenger side air bag module disconnected, an open circuit fault would normally be retrieved. • **Did the passenger side air bag on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	**Yes** GO to E22 . **No** GO to E20 .
E20 CHECK CIRCUIT CR112 (BU/GY) AND CIRCUIT RR112 (GN/OG) FOR A SHORT TO GROUND BETWEEN THE RCM AND PASSENGER SIDE AIR BAG MODULE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b. • Measure the resistance between passenger side air bag	**Yes** GO to E23 . **No** Due to the shorting bar

C3052-1, circuit CR112 (BU/GY), harness side and ground; and between passenger side air bag C3052-2, circuit RR112 (GN/OG), harness side and ground.  N0057647 • **Is the resistance greater than 1,000,000 ohms?**	feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR112 (BU/GY) or circuit RR112 (GN/OG). GO to E28 .
E21 CHECK CIRCUIT CR112 (BU/GY) AND CIRCUIT RR112 (GN/OG) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND PASSENGER SIDE AIR BAG MODULE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Side Air Bag Module C3052. • Disconnect: Passenger Safety Belt Buckle Pretensioner C3202. • Disconnect: RCM C310a and C310b. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Measure the voltage between passenger side air bag C3052-1, circuit CR112 (BU/GY), harness side and ground; and between passenger side air bag C3052-2, circuit RR112 (GN/OG), harness side and ground.  N0057646 • **Are the voltages less than 0.2 volt?**	**Yes** GO to E23 . **No** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR112 (BU/GY) or circuit RR112 (GN/OG). GO to E28 .
E22 CONFIRM THE SIDE AIR BAG MODULE FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Affected Side Air Bag C3051 (Driver) C3052 (Passenger). • Connect: RCM C310a and C310b. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position.	**Yes** REMOVE and INSPECT the seat side air bag module jumper harness, connector terminals for damage. REFER to Side Air Bag Module in this section. If a concern is found, REPAIR or INSTALL a new seat jumper harness. GO to E28 If a concern was not found, INSTALL a new driver or passenger side air bag

• Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2295 Fault PIDs. • **Was on-demand DTC B2295 retrieved?**	module. GO to E28 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, GO to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. For driver or passenger side air bag with a low resistance, open circuit or short to ground fault, GO to E24 . For driver or passenger side air bag with a short to ground fault, GO to E26 . For driver or passenger side air bag with a short to battery fault, GO to E27 .
E23 CONFIRM THE RCM FAULT	

NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.
• Key in OFF position.
• If previously directed to disconnect any SRS component(s):
  ▪ depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
  ▪ connect all previously disconnected restraint system component(s), including RCM C310a and C310b.
  ▪ repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Key in ON position.
• Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTC.
• Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2295 Fault PIDs.
• **Was on-demand DTC B2295 retrieved?**
	Yes
	INSTALL a new RCM and CARRY OUT programmable module installation (PMI). REFER to Restraints Control Module (RCM) in this section. GO to E28 .
	
	No
	In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, GO to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected.
	
	For driver or passenger side air bag with a low resistance, open circuit or short to ground fault, GO to E24 .
	
	For driver or passenger side air bag with a short to ground fault, GO to E26 .
	
	For driver or passenger side air bag with a short to battery

	fault, GO to E27 .
E24 CHECK FOR AN INTERMITTENT SIDE AIR BAG MODULE LOW RESISTANCE OR OPEN CIRCUIT FAULT	

• If the fault PID was reported for the driver side air bag module, monitor the following on the scan tool:
  ▪ driver side air bag resistance PID.
• If the fault PID was reported for the passenger side air bag, monitor the following on the scan tool:
  ▪ passenger side air bag resistance PID.
• **NOTE:** A resistance PID that reads between 0.9 and 1.31 ohms or between 4.29 and 5.0 ohms may or may not set an on-demand DTC yet indicates a strong potential of an intermittent fault condition. Make sure to thoroughly check wire harness(es), connectors and terminals as they are the likely source of the fault condition.
• Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness.
• **Does any side air bag on-demand fault PID indicate a fault is present or is the side air bag resistance PID less than 1.31 ohms or greater than 4.29 ohms?**
	Yes
	DEPOWER the SRS and REPAIR as necessary.
	
	Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information.
	
	GO to E28 .
	
	No
	GO to E25 .

E25 CHECK THE HARNESS AND CONNECTORS	

• Key in OFF position.
• Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect the affected side air bag module C3051 (driver) C3052 (passenger):
  ▪ inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
  ▪ inspect wire harness for any damage, pinched, cut or pierced wires.
• **Were any concerns found?**
	Yes
	REPAIR as necessary.
	
	Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information.
	
	GO to E28 .
	
	No
	The fault is not present and cannot be recreated at this time. GO to E28 .

E26 CHECK FOR AN INTERMITTENT SIDE AIR BAG MODULE CIRCUIT SHORT TO GROUND FAULT	

• If the fault PID was reported for the driver side air bag module, monitor the following on the scan tool:
  ▪ driver side air bag short to ground on-demand fault PID.
• If the fault PID was reported for the passenger side air bag, monitor the following on the scan tool:
  ▪ passenger side air bag short to ground on-demand fault PID.
• **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.
• Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness.
• **Does any side air bag on-demand fault PID indicate a fault is present?**
	Yes
	DEPOWER the SRS and REPAIR as necessary.
	
	Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information.
	
	GO to E28 .
	
	No
	The fault is not present and cannot be recreated at this time. GO to E28 .

E27 CHECK FOR AN INTERMITTENT SIDE AIR BAG MODULE CIRCUIT SHORT TO BATTERY FAULT	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.	**Yes** DEPOWER the SRS and REPAIR as necessary.

• Disconnect the affected side air bag module C3051 (driver) C3052 (passenger). • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update. • Monitor the driver or passenger side air bag module short to battery on-demand fault PIDs on the scan tool. • Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness. • **Does any side air bag on-demand fault PID indicate a fault is present?**	Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to E28 . **No** The fault is not present and cannot be recreated at this time. GO to E28 .
E28 CHECK FOR ADDITIONAL DTCs	
• Refer to the continuous memory DTCs recorded during Step E1. • **Were any continuous memory DTCs retrieved during Step E1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. If previously directed to depower the system, REPOWER the system. REFER to Supplemental Restraint System (SRS) Depowering and Repowering in this section. PROVE OUT the system. CLEAR all RCM DTCs.

Pinpoint Test F: DTC B2296 — Restraint System — Impact Sensor Fault

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors all of the impact sensor circuits for faults. If the RCM detects one of the following faults on any of the impact sensor circuits, it will store diagnostic trouble code (DTC) B2296 in memory and illuminate the air bag warning indicator.

Fault Conditions

The RCM monitors for the following fault conditions:

- Low resistance
- Circuit open
- Circuit short to voltage
- Circuit short to ground

Possible Causes

An impact sensor fault can be caused by:

- damaged wiring, terminals or connectors.
- a faulty impact sensor.
- incorrect sensor mounting.
- RCM is faulted.

PINPOINT TEST F: DTC B2296 — RESTRAINT SYSTEM — IMPACT SENSOR FAULT

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough Inspection and Verification before proceeding with the Pinpoint Test.

NOTE: Do not probe any impact sensor. The impact sensor is an electronic device and can not be tested using a multi-meter.

Test Step	Result / Action to Take
F1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2296 Fault PIDs. • **Was on-demand DTC B2296 retrieved?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Using the fault PIDs recorded, GO to the appropriate pinpoint test step. For first row driver side impact sensor with a mounting/communications fault, GO to F2 . For first row driver side impact sensor with an internal fault, INSTALL a new first row driver side impact sensor. REFER to Side Impact Sensor — Front Door in this section. GO to F50 . For first row passenger side impact sensor with a mounting/communications fault, GO to F10 .

	For first row passenger side impact sensor with an internal fault, INSTALL a new first row passenger side impact sensor. REFER to Side Impact Sensor — Front Door in this section. GO to F50. For second row driver side impact sensor with a mounting/communication fault, GO to F18. For second row driver side impact sensor with an internal fault, INSTALL a new second row driver side impact sensor. REFER to Side Impact Sensor — C-Pillar in this section. GO to F50. For second row passenger side impact sensor with a mounting/communications fault, GO to F28. For second row passenger side impact sensor with an internal fault, INSTALL a new second row passenger side impact sensor. REFER to Side Impact Sensor — C-Pillar in this section. GO to F50. For front impact severity sensor with a mounting/communications fault, GO to F38. For front impact severity sensor with an internal fault, INSTALL a new front impact severity sensor. REFER to Front Impact Severity Sensor in this section. GO to F50. **No** This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. GO to F49.
F2 INSPECT THE FIRST ROW DRIVER SIDE IMPACT SENSOR MOUNTING AND MOUNTING SURFACE	

• Key in OFF position.
• Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Access the first row driver side impact sensor located in the driver front door. Refer to Side Impact Sensor — Front Door in this section.
• Inspect the first row driver side impact sensor for:
  ▪ loose electrical connector.
  ▪ improper mounting.
• Remove the first row driver side impact sensor.
• Visually inspect the first row driver side impact sensor, electrical connector and mounting surface
	Yes
	If the first row driver side impact sensor was not attached to the mounting surface correctly, REINSTALL the sensor correctly or REPAIR the mounting surface as necessary. GO to F50.
	
	If the first row driver side impact sensor was damaged, INSTALL a new first row driver side impact sensor. GO to F50.

for damage. • **Was the first row driver side impact sensor damaged, attached to the mounting surface incorrectly or not fully seated and tightened correctly?**	**No** GO to F3 .
F3 INSTALL THE FIRST ROW DRIVER SIDE IMPACT SENSOR AND CARRY OUT THE ON-DEMAND SELF TEST	
• Clean and repair the mounting surface as necessary. • Install the first row driver side impact sensor. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2296 Fault PIDs. • **Was on-demand DTC B2296 retrieved?**	**Yes** GO to F4 . **No** Fault corrected. GO to F50 .
F4 CHECK CIRCUIT VR217 (GY/YE) AND CIRCUIT RR131 (VT/GY) FOR A SHORT TO VOLTAGE BETWEEN THE FIRST ROW DRIVER SIDE IMPACT SENSOR AND RCM	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: First Row Driver Side Impact Sensor C539. • Disconnect: RCM C310a and C310b. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Measure the voltage between first row driver side impact sensor C539-2, circuit RR131 (VT/GY), harness side and ground; and between C539-1, circuit VR217 (GY/YE), harness side and ground.  N0052817 • **Are the voltages less than 0.2 volt?**	**Yes** GO to F5 . **No** REPAIR circuit VR217 (GY/YE) or circuit RR131 (VT/GY). GO to F50 .
F5 CHECK CIRCUIT VR217 (GY/YE) AND CIRCUIT RR131 (VT/GY) FOR A SHORT TO GROUND BETWEEN THE FIRST ROW DRIVER SIDE IMPACT SENSOR AND RCM	

• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Measure the resistance between first row driver side impact sensor C539-2, circuit RR131 (VT/GY), harness side and ground; and between C539-1, circuit VR217 (GY/YE), harness side and ground.  N0052818 • **Are the resistances greater than 1,000,000 ohms?**	**Yes** GO to F6 . **No** REPAIR circuit VR217 (GY/YE) or circuit RR131 (VT/GY). GO to F50 .
F6 CHECK CIRCUIT VR217 (GY/YE) FOR AN OPEN BETWEEN THE RCM AND FIRST ROW DRIVER SIDE IMPACT SENSOR	
• Measure the resistance between RCM C310b-28, circuit VR217 (GY/YE), harness side and first row driver side impact sensor C539-1, circuit VR217 (GY/YE), harness side.  N0052819 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to F7 . **No** REPAIR circuit VR217 (GY/YE). GO to F50 .
F7 CHECK CIRCUIT RR131 (VT/GY) FOR AN OPEN BETWEEN THE RCM AND FIRST ROW DRIVER SIDE IMPACT SENSOR	
• Measure the resistance between RCM C310b-27, circuit RR131 (VT/GY), harness side and first row driver side impact sensor C539-2, circuit RR131 (VT/GY), harness side.  N0052820 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to F8 . **No** REPAIR circuit RR131 (VT/GY). GO to F50 .

F8 CHECK CIRCUIT VR217 (GY/YE) FOR A SHORT TO CIRCUIT RR131 (VT/GY) BETWEEN THE RCM AND FIRST ROW DRIVER SIDE IMPACT SENSOR	
• Measure the resistance between first row driver side impact sensor C539-1, circuit VR217 (GY/YE), harness side and C539-2, circuit RR131 (VT/GY), harness side.  • **Is the resistance greater than 1,000,000 ohms?**	**Yes** GO to F9 . **No** REPAIR circuit VR217 (GY/YE) and circuit RR131 (VT/GY). GO to F50 .
F9 CHECK FIRST ROW DRIVER SIDE IMPACT SENSOR	
• Connect: RCM C310a and C310b. • Install a known good first row driver side impact sensor. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2296 Fault PIDs. • **Were any on-demand fault PIDs for the first row driver side impact sensor indicating a fault?**	**Yes** GO to F48 . **No** Fault corrected. GO to F50 .
F10 INSPECT THE FIRST ROW PASSENGER SIDE IMPACT SENSOR MOUNTING AND MOUNTING SURFACE	

• Key in OFF position.
• Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Access the first row passenger side impact sensor located in the front door. Refer to Side Impact Sensor — Front Door in this section.
• Inspect the first row passenger side impact sensor for:
  ▪ loose electrical connector.
  ▪ improper mounting.
• Remove the first row passenger side impact sensor.
• Visually inspect the first row passenger side impact sensor, electrical connector and mounting surface for damage.
• **Was the first row passenger side impact sensor damaged, attached to the mounting surface incorrectly or not fully seated and tightened correctly?**
	Yes
	If the first row passenger side impact sensor was not attached to the mounting surface correctly, REINSTALL the sensor correctly or REPAIR the mounting surface as necessary. GO to F50 .
	
	If the first row passenger side impact sensor was damaged, INSTALL a new first row passenger side impact sensor. GO to F50 .
	
	No
	GO to F11 .

F11 INSTALL THE FIRST ROW PASSENGER SIDE IMPACT SENSOR AND CARRY OUT THE ON-DEMAND SELF TEST	
• Clean and repair the mounting surface as necessary. • Install the first row passenger side impact sensor. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2296 Fault PIDs. • **Was on-demand DTC B2296 retrieved?**	**Yes** GO to F12 . **No** Fault corrected. GO to F50 .
F12 CHECK CIRCUIT VR218 (YE/OG) AND CIRCUIT RR132 (BU/WH) FOR A SHORT TO VOLTAGE BETWEEN THE FIRST ROW PASSENGER SIDE IMPACT SENSOR AND RCM	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: First Row Passenger Side Impact Sensor C631. • Disconnect: RCM C310a and C310b. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Measure the voltage between first row passenger side impact sensor C631-1, circuit VR218 (YE/OG), harness side and ground; and between C631-2, circuit RR132 (BU/WH), harness side and ground.  • **Are the voltages less than 0.2 volt?**	**Yes** GO to F13 . **No** REPAIR circuit VR218 (YE/OG) or circuit RR132 (BU/WH). GO to F50 .
F13 CHECK CIRCUIT VR218 (YE/OG) AND CIRCUIT RR132 (BU/WH) FOR A SHORT TO GROUND BETWEEN THE FIRST ROW PASSENGER SIDE IMPACT SENSOR AND RCM	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Measure the resistance between first row passenger side impact sensor C631-1, circuit	**Yes** GO to F14 . **No** REPAIR circuit VR218 (YE/OG) or circuit RR132 (BU/WH). GO to F50 .

VR218 (YE/OG), harness side and ground; and between C631-2, circuit RR132 (BU/WH), harness side and ground.  N0052818 • **Are the resistances greater than 1,000,000 ohms?**	
F14 CHECK CIRCUIT VR218 (YE/OG) FOR AN OPEN BETWEEN THE RCM AND FIRST ROW PASSENGER SIDE IMPACT SENSOR	
• Measure the resistance between RCM C310b-29, circuit VR218 (YE/OG), harness side and first row passenger side impact sensor C631-1, circuit VR218 (YE/OG), harness side.  N0052823 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to F15 . **No** REPAIR circuit VR218 (YE/OG). GO to F50 .
F15 CHECK CIRCUIT RR132 (BU/WH) FOR AN OPEN BETWEEN THE RCM AND FIRST ROW PASSENGER SIDE IMPACT SENSOR	
• Measure the resistance between RCM C310b-30, circuit RR132 (BU/WH), harness side and first row passenger side impact sensor C631-2, circuit RR132 (BU/WH), harness side.  N0052822 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to F16 . **No** REPAIR circuit RR132 (BU/WH). GO to F50 .
F16 CHECK CIRCUIT VR218 (YE/OG) FOR A SHORT TO CIRCUIT RR132 (BU/WH) BETWEEN THE RCM AND FIRST ROW PASSENGER SIDE IMPACT SENSOR	

• Measure the resistance between first row passenger side impact sensor C631-1, circuit VR218 (YE/OG), harness side and C631-2, circuit RR132 (BU/WH), harness side.  • **Is the resistance greater than 1,000,000 ohms?**	**Yes** GO to F17 . **No** REPAIR short between circuit VR218 (YE/OG) and circuit RR132 (BU/WH). GO to F50 .
F17 CHECK FIRST ROW PASSENGER SIDE IMPACT SENSOR	
• Connect: RCM C310a and C310b. • Install a known good first row passenger side impact sensor. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2296 Fault PIDs. • **Were any on-demand fault PIDs for the first row passenger side impact sensor indicating a fault?**	**Yes** GO to F48 . **No** Fault corrected. GO to F50 .
F18 INSPECT THE SECOND ROW DRIVER SIDE IMPACT SENSOR MOUNTING AND MOUNTING SURFACE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Access the second row driver side impact sensor and inspect the mounting and make sure that the retaining bolt is fully seated and tightened correctly. Refer to Side Impact Sensor — C-Pillar in this section. • Remove the second row driver side impact sensor. • Visually inspect the second row driver side impact sensor and mounting surface for damage, corrosion or dirt. • **Was the second row driver side impact sensor damaged, a significant amount of corrosion or dirt found, attached to the mounting surface incorrectly or was the impact sensor bolt not fully seated and tightened correctly?**	**Yes** If the second row driver side impact sensor was not attached to the mounting surface correctly, REINSTALL the sensor correctly and CLEAN or REPAIR the mounting surface as necessary. GO to F50 . If the second row driver side impact sensor was damaged, INSTALL a new second row driver side impact sensor. GO to F50 . **No** GO to F19 .
F19 INSTALL THE SECOND ROW DRIVER SIDE IMPACT SENSOR AND CARRY OUT THE ON-DEMAND SELF TEST	

• Clean and repair the mounting surface as necessary. • Clean the second row driver side impact sensor mounting bolt. • Install the second row driver side impact sensor. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2296 Fault PIDs. • **Was on-demand DTC B2296 retrieved?**	**Yes** GO to F20 . **No** Fault corrected. GO to F50 .
F20 CHECK SECOND ROW DRIVER SIDE IMPACT SENSOR GROUND CIRCUIT RR133 (GY/BN) FOR HIGH RESISTANCE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Second Row Driver Side Impact Sensor C3314. • Measure the resistance between second row driver side impact sensor C3248-2, circuit RR133 (GY/BN), harness side and the second row driver side impact sensor case ground. • **Is the resistance less than 10 ohms?**	**Yes** GO to F22 . **No** GO to F21 .
F21 CLEAN THE SECOND ROW DRIVER SIDE IMPACT SENSOR MOUNTING SURFACE AND CARRY OUT THE ON-DEMAND SELF TEST	
• Remove the second row driver side impact sensor. • Clean and repair the mounting surface as necessary. • Clean the second row driver side impact sensor mounting bolt. • Install the second row driver side impact sensor. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2296 Fault PIDs. • **Was on-demand DTC B2296 retrieved?**	**Yes** GO to F22 . **No** Fault corrected. GO to F50 .
F22 CHECK CIRCUIT VR219 (GN/WH) AND CIRCUIT RR133 (GY/BN) FOR A SHORT TO VOLTAGE BETWEEN THE SECOND ROW DRIVER SIDE IMPACT SENSOR AND RCM	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.	**Yes** GO to F23 . **No**

• Disconnect: Second Row Driver Side Impact Sensor C3314. • Disconnect: RCM C310a and C310b. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Measure the voltage between second row driver side impact sensor C3314-1, circuit VR219 (GN/WH), harness side and ground; and between C3314-2, circuit RR133 (GY/BN), harness side and ground.  N0036990 • **Are the voltages less than 0.2 volt?**	REPAIR circuit VR219 (GN/WH) or circuit RR133 (GY/BN). GO to F50 .
F23 CHECK CIRCUIT VR219 (GN/WH) AND CIRCUIT RR133 (GY/BN) FOR A SHORT TO GROUND BETWEEN THE SECOND ROW DRIVER SIDE IMPACT SENSOR AND RCM	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Measure the resistance between second row driver side impact sensor C3314-1, circuit VR219 (GN/WH), harness side and ground; and between C3314-2, circuit RR133 (GY/BN), harness side and ground.  N0036989 • **Are the resistances greater than 1,000,000 ohms?**	**Yes** GO to F24 . **No** REPAIR circuit VR219 (GN/WH) or circuit RR133 (GY/BN). GO to F50 .
F24 CHECK CIRCUIT VR219 (GN/WH) FOR AN OPEN BETWEEN THE RCM AND SECOND ROW DRIVER SIDE IMPACT SENSOR	
• Measure the resistance between RCM C310b-14, circuit VR219 (GN/WH), harness side and second row driver side impact sensor C3314-1, circuit VR219 (GN/WH), harness side.	**Yes** GO to F25 . **No** REPAIR circuit VR219 (GN/WH). GO to F50 .

 N0036982 • **Is the resistance less than 0.5 ohm?**	
F25 CHECK CIRCUIT RR133 (GY/BN) FOR AN OPEN BETWEEN THE RCM AND SECOND ROW DRIVER SIDE IMPACT SENSOR	
• Measure the resistance between RCM C310b-13, circuit RR135 (GY/BN), harness side and second row driver side impact sensor C3314-2, circuit RR133 (GY/BN), harness side.  N0036981 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to F26 . **No** REPAIR circuit RR133 (GY/BN). GO to F50 .
F26 CHECK CIRCUIT VR219 (GN/WH) FOR A SHORT TO CIRCUIT RR133 (GY/BN) BETWEEN THE RCM AND SECOND ROW DRIVER SIDE IMPACT SENSOR	
• Measure the resistance between second row driver side impact sensor C3314-1, circuit VR219 (GN/WH), harness side and C3314-2, circuit RR135 (GY/BN), harness side.  N0036987 • **Is the resistance greater than 1,000,000 ohms?**	**Yes** GO to F27 . **No** REPAIR circuit VR219 (GN/WH) and circuit RR133 (GY/BN). GO to F50 .
F27 CHECK SECOND ROW DRIVER SIDE IMPACT SENSOR	
• Connect: RCM C310a and C310b. • Install a known good second row driver side impact sensor. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this	**Yes** GO to F48 . **No** Fault corrected. GO to F50 .

section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2296 Fault PIDs. • **Were any on-demand fault PIDs for the second row driver side impact sensor indicating a fault?**	
F28 INSPECT THE SECOND ROW PASSENGER SIDE IMPACT SENSOR MOUNTING AND MOUNTING SURFACE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Access the second row passenger side impact sensor and inspect the mounting and make sure that the retaining bolt is fully seated and tightened correctly. Refer to Side Impact Sensor — C-Pillar in this section. • Remove the second row passenger side impact sensor. • Visually inspect the second row passenger side impact sensor and mounting surface for damage, corrosion or dirt. • **Was the second row passenger side impact sensor damaged, a significant amount of corrosion or dirt found, attached to the mounting surface incorrectly or was the impact sensor bolt not fully seated and tightened correctly?**	**Yes** If the second row passenger side impact sensor was not attached to the mounting surface correctly, REINSTALL the sensor correctly and CLEAN or REPAIR the mounting surface as necessary. GO to F50. If the second row passenger side impact sensor was damaged, INSTALL a new second row passenger side impact sensor. GO to F50. **No** GO to F29.
F29 INSTALL THE SECOND ROW PASSENGER SIDE IMPACT SENSOR AND CARRY OUT THE ON-DEMAND SELF TEST	
• Clean and repair the mounting surface as necessary. • Clean the second row passenger side impact sensor mounting bolt. • Install the second row passenger side impact sensor. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2296 Fault PIDs. • **Was on-demand DTC B2296 retrieved?**	**Yes** GO to F30. **No** Fault corrected. GO to F50.
F30 CHECK SECOND ROW PASSENGER SIDE IMPACT SENSOR GROUND CIRCUIT RR130 (GN/BU) FOR HIGH RESISTANCE	
• Key in OFF position. • Depower the system. Refer to Supplemental	**Yes** GO to F32.

Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Second Row Passenger Side Impact Sensor C3315. • Measure the resistance between second row passenger side impact sensor C3315-2, circuit RR130 (GN/BU), harness side and the second row passenger side impact sensor case ground. • **Is the resistance less than 10 ohms?**	**No** GO to F31 .
F31 CLEAN THE SECOND ROW PASSENGER SIDE IMPACT SENSOR MOUNTING SURFACE AND CARRY OUT THE ON-DEMAND SELF TEST	
• Remove the second row passenger side impact sensor. • Clean and repair the mounting surface as necessary. • Clean the second row passenger side impact sensor mounting bolt. • Install the second row passenger side impact sensor. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2296 Fault PIDs. • **Was on-demand DTC B2296 retrieved?**	**Yes** GO to F32 . **No** Fault corrected. GO to F50 .
F32 CHECK CIRCUIT VR220 (VT/OG) AND CIRCUIT RR130 (GN/BU) FOR A SHORT TO VOLTAGE BETWEEN THE SECOND ROW PASSENGER SIDE IMPACT SENSOR AND RCM	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Second Row Passenger Side Impact Sensor C3315. • Disconnect: RCM C310a and C310b. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Measure the voltage between second row passenger side impact sensor C3315-1, circuit VR220 (VT/OG), harness side and ground; and between C3315-2, circuit RR130 (GN/BU), harness side and ground.	**Yes** GO to F33 . **No** REPAIR circuit VR220 (VT/OG) or circuit RR130 (GN/BU). GO to F50 .

 N0036990 • **Are the voltages less than 0.2 volt?**	
F33 CHECK CIRCUIT VR220 (VT/OG) AND CIRCUIT RR130 (GN/BU) FOR A SHORT TO GROUND BETWEEN THE SECOND ROW PASSENGER SIDE IMPACT SENSOR AND RCM	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Measure the resistance between second row passenger side impact sensor C3315-1, circuit VR220 (VT/OG), harness side and ground; and between C3315-2, circuit RR130 (GN/BU), harness side and ground.  N0036989 • **Are the resistances greater than 1,000,000 ohms?**	**Yes** GO to F34 . **No** REPAIR circuit VR220 (VT/OG) or circuit RR130 (GN/BU). GO to F50 .
F34 CHECK CIRCUIT VR220 (VT/OG) FOR AN OPEN BETWEEN THE RCM AND SECOND ROW PASSENGER SIDE IMPACT SENSOR	
• Measure the resistance between RCM C310b-15, circuit VR220 (VT/OG), harness side and second row passenger side impact sensor C3315-1, circuit VR220 (VT/OG), harness side.  N0036980 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to F35 . **No** REPAIR circuit VR220 (VT/OG). GO to F50 .
F35 CHECK CIRCUIT RR130 (GN/BU) FOR AN OPEN	

BETWEEN THE RCM AND SECOND ROW PASSENGER SIDE IMPACT SENSOR	
• Measure the resistance between RCM C310b-16, circuit RR130 (GN/BU), harness side and second row passenger side impact sensor C3315-2, circuit RR130 (GN/BU), harness side.  • **Is the resistance less than 0.5 ohm?**	**Yes** GO to F36 . **No** REPAIR circuit RR130 (GN/BU). GO to F50 .
F36 CHECK CIRCUIT VR220 (VT/OG) FOR A SHORT TO CIRCUIT RR130 (GN/BU) BETWEEN THE RCM AND SECOND ROW PASSENGER SIDE IMPACT SENSOR	
• Measure the resistance between second row passenger side impact sensor C3315-1, circuit VR220 (VT/OG), harness side and C3315-2, circuit RR130 (GN/BU), harness side.  • **Is the resistance greater than 1,000,000 ohms?**	**Yes** GO to F37 . **No** REPAIR circuit VR220 (VT/OG) and circuit RR130 (GN/BU). GO to F50 .
F37 CHECK SECOND ROW PASSENGER SIDE IMPACT SENSOR	
• Connect: RCM C310a and C310b. • Install a known good second row passenger side impact sensor. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2296 Fault PIDs. • **Were any on-demand fault PIDs for the second row passenger side impact sensor indicating a fault?**	**Yes** GO to F48 . **No** Fault corrected. GO to F50 .
F38 INSPECT THE FRONT IMPACT SEVERITY	

SENSOR MOUNTING AND MOUNTING SURFACE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Inspect the front impact severity sensor mounting and make sure that the retaining bolt is fully seated and tightened correctly. • Remove the front impact severity sensor. Refer to Front Impact Severity Sensor in this section. • Visually inspect the front impact severity sensor and mounting surface for damage, corrosion or dirt. • **Was the front impact severity sensor damaged, a significant amount of corrosion or dirt found, attached to the mounting surface incorrectly or was the impact sensor bolt not fully seated and tightened correctly?**	**Yes** If the front impact severity sensor was not attached to the mounting surface correctly, REINSTALL the sensor correctly and CLEAN or REPAIR the mounting surface as necessary. GO to F50 . If the front impact severity sensor was damaged, INSTALL a new front impact severity sensor. GO to F50 . **No** GO to F39 .
F39 INSTALL THE FRONT IMPACT SEVERITY SENSOR AND CARRY OUT THE ON-DEMAND SELF TEST	
• Clean and repair the mounting surface as necessary. • Clean the front impact severity sensor mounting bolt. • Install the front impact severity sensor. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2296 Fault PIDs. • **Was on-demand DTC B2296 retrieved?**	**Yes** GO to F40 . **No** Fault corrected. GO to F50 .
F40 CHECK FRONT IMPACT SEVERITY SENSOR GROUND CIRCUIT RR129 (YE/GY) FOR HIGH RESISTANCE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Front Impact Severity Sensor C177. • Measure the resistance between front impact severity sensor C177-2, circuit RR129 (YE/GY), harness side and the front impact severity sensor case ground. • **Is the resistance less than 10 ohms?**	**Yes** GO to F42 . **No** GO to F41 .
F41 CLEAN THE FRONT IMPACT SEVERITY SENSOR MOUNTING SURFACE AND CARRY OUT THE ON-DEMAND SELF-TEST	
• Remove the front impact severity sensor. • Clean and repair the mounting surface as necessary. • Clean the front impact severity sensor mounting bolts. • Install the front impact severity sensor. • Repower the system. **Do not** prove out the system	**Yes** GO to F42 . **No** Fault corrected. GO to F50 .

at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2296 Fault PIDs. • **Was on-demand DTC B2296 retrieved?**	
F42 CHECK CIRCUIT VR213 (VT/GN) AND CIRCUIT RR129 (YE/GY) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND FRONT IMPACT SEVERITY SENSOR	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Front Impact Severity Sensor C177. • Disconnect: RCM C310a and C310b. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Measure the voltage between front impact severity sensor C177-1, circuit VR213 (VT/GN), harness side and ground; and between front impact severity sensor C177-2, circuit RR129 (YE/GY), harness side and ground.  N0036990 • **Are the voltages less than 0.2 volt?**	**Yes** GO to F43 . **No** REPAIR circuit VR213 (VT/GN) or circuit RR129 (YE/GY). GO to F50 .
F43 CHECK CIRCUIT VR213 (VT/GN) AND CIRCUIT RR129 (YE/GY) FOR A SHORT TO GROUND BETWEEN THE RCM AND FRONT IMPACT SEVERITY SENSOR	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Measure the resistance between front impact severity sensor C177-1, circuit VR213 (VT/GN), harness side and ground; and between front impact severity sensor C177-2, circuit RR129 (YE/GY), harness side and ground.	**Yes** GO to F44 . **No** REPAIR circuit VR213 (VT/GN) or circuit RR129 (YE/GY). GO to F50 .

 N0036989 • **Are the resistances greater than 1,000,000 ohms?**	
F44 CHECK CIRCUIT VR213 (VT/GN) FOR AN OPEN BETWEEN THE RCM AND FRONT IMPACT SEVERITY SENSOR	
• Measure the resistance between RCM C310b-19, circuit VR213 (VT/GN), harness side and front impact severity sensor C177-1, circuit VR213 (VT/GN), harness side.  N0036978 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to F45 . **No** REPAIR circuit VR213 (VT/GN). GO to F50 .
F45 CHECK CIRCUIT RR129 (YE/GY) FOR AN OPEN BETWEEN THE RCM AND FRONT IMPACT SEVERITY SENSOR	
• Measure the resistance between RCM C310b-20, circuit RR129 (YE/GY), harness side and front impact severity sensor C177-2, circuit RR129 (YE/GY), harness side.  N0036977 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to F46 . **No** REPAIR circuit RR129 (YE/GY). GO to F50 .
F46 CHECK CIRCUIT VR213 (VT/GN) FOR A SHORT TO CIRCUIT RR129 (YE/GY) BETWEEN THE RCM AND FRONT IMPACT SEVERITY SENSOR	
• Measure the resistance between front impact severity sensor C177-1, circuit VR213 (VT/GN), harness side and C177-2, circuit RR129 (YE/GY), harness side.	**Yes** GO to F47 . **No**

 N0036987 • **Is the resistance greater than 1,000,000 ohms?**	REPAIR circuit VR213 (VT/GN) and circuit RR129 (YE/GY). GO to F50 .
F47 CHECK FRONT IMPACT SEVERITY SENSOR • Connect: RCM C310a and C310b. • Install a known good front impact severity sensor. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2296 Fault PIDs. • **Were any on-demand fault PIDs for the front impact severity sensor indicating a fault?**	**Yes** GO to F48 . **No** Fault corrected. GO to F50 .
F48 CONFIRM THE RCM FAULT **NOTE:** Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Install the original sensor. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2296 Fault PIDs. • **Was on-demand DTC B2296 retrieved?**	**Yes** INSTALL a new RCM and CARRY OUT programmable module installation (PMI). REFER to Restraints Control Module (RCM) in this section. GO to F50 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. GO to F49 .
F49 CHECK FOR AN INTERMITTENT FAULT • Key in OFF position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2296 Fault PIDs. • **Was on-demand DTC B2296 retrieved?**	**Yes** This is a hard fault. The fault condition is now present. The fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Using the fault PIDs recorded, GO to

	the appropriate pinpoint test step. For first row driver side impact sensor with a mounting/communications fault, GO to F2 . For first row driver side impact sensor with an internal fault, INSTALL a new first row driver side impact sensor. REFER to Side Impact Sensor — Front Door in this section. GO to F50 . For first row passenger side impact sensor with a mounting/communications fault, GO to F10 . For first row passenger side impact sensor with an internal fault, INSTALL a new first row passenger side impact sensor. REFER to Side Impact Sensor — Front Door in this section. GO to F50 . For second row driver side impact sensor with a mounting/communication fault, GO to F18 . For second row driver side impact sensor with an internal fault, INSTALL a new second row driver side impact sensor. REFER to Side Impact Sensor — C-Pillar in this section. GO to F50 . For second row passenger side impact sensor with a mounting/communications fault, GO to F28 . For second row passenger side impact sensor with an internal fault, INSTALL a new second row passenger side impact sensor. REFER to Side Impact Sensor — C-Pillar in this section. GO to F50 . For front impact severity sensor with a mounting/communications fault, GO to F38 . For front impact severity sensor with an internal fault, INSTALL a new front impact severity sensor. REFER to Front Impact Severity Sensor in this section. GO to F50 . **No** VISUALLY INSPECT the affected impact sensor, mounting brackets and mounting surface for damage, corrosion or dirt. INSPECT the wiring, terminals and connectors for damage,

	corrosion or dirt. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. ACTIVATE other systems in the same wire harness. REPAIR any intermittent concerns found. GO to F50 .
F50 CHECK FOR ADDITIONAL DTCs • Refer to the continuous memory DTCs recorded during Step F1. • **Were any continuous memory DTCs retrieved during Step F1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. If previously directed to depower the system, REPOWER the system. REFER to Supplemental Restraint System (SRS) Depowering and Repowering in this section. PROVE OUT the system. CLEAR all RCM DTCs.

Pinpoint Test G: DTC B2434 — Drivers Seat Belt Buckle Switch Short to Ground

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors the driver safety belt buckle switch circuits for faults. If the RCM detects a short to ground fault, it will store diagnostic trouble code (DTC) B2434 in memory and illuminate the air bag warning indicator.

Possible Causes

A driver safety belt buckle switch circuit fault can be caused by:

- damaged wiring, terminals or connectors.
- a faulty driver safety belt buckle assembly.
- a faulted RCM.

PINPOINT TEST G: DTC B2434 — DRIVERS SEAT BELT BUCKLE SWITCH SHORT TO GROUND

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air

bag deployment, which can result in personal injury.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough Inspection and Verification before proceeding with the Pinpoint Test.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
G1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs	
• Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC B2434 retrieved?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to G2 . **No** This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. GO to G5 .
G2 CHECK DRIVER SAFETY BELT BUCKLE SWITCH FOR A SHORT TO GROUND	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Belt Buckle Switch C3065. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the driver safety belt buckle switch disconnected, a open circuit fault would normally be retrieved. • **Did the driver safety belt buckle switch on-demand DTC change from indicating B2434 to B2691?**	**Yes** INSTALL a new driver safety belt buckle assembly. Refer to Section 501-20A . GO to G6 . **No** GO to G3 .
G3 CHECK CIRCUIT CR201 (BU/OG) FOR A SHORT TO	

GROUND BETWEEN THE RCM AND DRIVER SAFETY BELT BUCKLE SWITCH	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b. • Measure the resistance between driver safety belt buckle switch C3065-2, circuit CR201 (BU/OG), harness side and ground.  A0090711 • **Is the resistance greater than 1,000,000 ohms?**	**Yes** GO to G4 . **No** REPAIR circuit CR201 (BU/OG). Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to G6 .
G4 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Connect: Driver Safety Belt Buckle Switch C3065. • Connect: RCM C310a and C310b. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC B2434 retrieved?**	**Yes** INSTALL a new RCM and CARRY OUT programmable module installation (PMI). REFER to Restraints Control Module (RCM) in this section. GO to G6 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. GO to G5 .
G5 CHECK FOR AN INTERMITTENT FAULT	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC B2434 retrieved?**	**Yes** This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to G2 . **No** CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to G6 .

G6 CHECK FOR ADDITIONAL DTCs	
• Refer to the continuous memory DTCs recorded during Step G1. • **Were any continuous memory DTCs retrieved during Step G1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Chart in this section for pinpoint test direction. **No** RECONNECT the system. If previously directed to depower the system, REPOWER the system. REFER to Supplemental Restraint System (SRS) Depowering and Repowering in this section. PROVE OUT the system. CLEAR all RCM DTCs.

Pinpoint Test H: DTC B2435 — Drivers Seat Belt Buckle Switch Resistance Out of Range

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors the driver safety belt buckle switch circuits for faults. If the RCM detects a current out of range fault, it will store diagnostic trouble code (DTC) B2435 in memory and illuminate the air bag warning indicator.

Possible Causes

A driver safety belt buckle switch current out of range fault can be caused by:

- damaged wiring, terminals or connectors.
- a faulty driver safety belt buckle assembly.
- RCM is faulted.

PINPOINT TEST H: DTC B2435 — DRIVERS SEAT BELT BUCKLE SWITCH RESISTANCE OUT OF RANGE

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle

pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough Inspection and Verification before proceeding with the Pinpoint Test.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
H1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs	
• Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC B2435 retrieved?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to H2 . **No** This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. GO to H4 .
H2 CHECK SAFETY BELT BUCKLE SWITCH	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Belt Buckle Switch C3065. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the driver safety belt buckle switch disconnected, a open circuit fault would normally be retrieved. • **Did the driver safety belt buckle switch on-demand DTC change from indicating B2435 to B2691?**	**Yes** INSTALL a new driver safety belt buckle assembly. REFER to Section 501-20A . GO to H5 . **No** GO to H3 .
H3 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system	**Yes**

components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Driver Safety Belt Buckle Switch C3065. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC B2435 retrieved?**	INSTALL a new RCM and CARRY OUT programmable module installation (PMI). REFER to Restraints Control Module (RCM) in this section. GO to H5 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. GO to H4 .
H4 CHECK FOR AN INTERMITTENT FAULT	

• Key in OFF position.
• Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect the driver safety belt buckle switch C3065:
  ▪ Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
  ▪ Inspect wire harness for any damage, pinched, cut or pierced wires.
  ▪ Repair any concerns found. REFER to
 	
Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information.
 	
• Connect: All Previously Disconnected Component(s)/Connector(s).
• Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Key in ON position.
• Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs.
• **Was on-demand DTC B2435 retrieved?**
	Yes
	This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to H2 .
	
	No
	The fault is not present and cannot be recreated at this time. GO to H5 .

H5 CHECK FOR ADDITIONAL DTCs	
• Refer to the continuous memory DTCs recorded during Step H1. • **Were any continuous memory DTCs retrieved during Step H1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. If previously

	directed to depower the system, REPOWER the system. REFER to Supplemental Restraint System (SRS) Depowering and Repowering in this section. PROVE OUT the system. CLEAR all RCM DTCs.

Pinpoint Test I: DTC B2438 — Passengers Seat Belt Buckle Switch Short to Ground

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors the passenger safety belt buckle switch circuits for faults. If the RCM detects a short to ground fault, it will store diagnostic trouble code (DTC) B2438 in memory and illuminate the air bag warning indicator.

Possible Causes

A passenger safety belt buckle switch short to ground fault can be caused by:

- damaged wiring, terminals or connectors.
- a faulty passenger safety belt buckle assembly.
- RCM is faulted.

PINPOINT TEST I: DTC B2438 — PASSENGERS SEAT BELT BUCKLE SWITCH SHORT TO GROUND

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

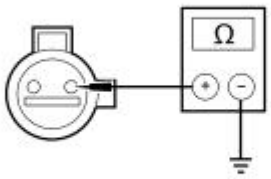
WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough Inspection and Verification before proceeding with the Pinpoint Test.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
I1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs	
• Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC B2438 retrieved?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to I2 . **No** This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. GO to I5 .
I2 CHECK PASSENGER SAFETY BELT BUCKLE SWITCH FOR A SHORT TO GROUND	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Safety Belt Buckle Switch C3066. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the passenger safety belt buckle switch disconnected, a open circuit fault would normally be retrieved. • **Did the passenger safety belt buckle switch on-demand DTC change from indicating B2438 to B2692?**	**Yes** INSTALL a new passenger safety belt buckle assembly. REFER to Section 501-20A . GO to I6 . **No** GO to I3 .
I3 CHECK CIRCUIT CR202 (BN/GN) FOR A SHORT TO GROUND BETWEEN THE RCM AND PASSENGER SAFETY BELT BUCKLE SWITCH	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b. • Measure the resistance between passenger seat belt buckle switch C3066-1, circuit CR202 (BN/GN), harness side and ground.	**Yes** GO to I4 . **No** REPAIR circuit CR202 (BN/GN). GO to I6 .



A0090711

- **Is the resistance greater than 1,000,000 ohms?**

I4 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Connect: Passenger Safety Belt Buckle Switch C3066. • Connect: RCM C310a and C310b. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC B2438 retrieved?**	**Yes** INSTALL a new RCM and CARRY OUT programmable module installation (PMI). REFER to Restraints Control Module (RCM) in this section. GO to I6 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. GO to I5 .
I5 CHECK FOR AN INTERMITTENT FAULT	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC B2438 retrieved?**	**Yes** This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to I2 . **No** CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to I6 .
I6 CHECK FOR ADDITIONAL DTCs	
• Refer to the continuous memory DTCs recorded during Step I1. • **Were any continuous memory DTCs retrieved during Step I1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Chart in this section for pinpoint test direction. **No**

	RECONNECT the system. If previously directed to depower the system, REPOWER the system. REFER to Supplemental Restraint System (SRS) Depowering and Repowering in this section. PROVE OUT the system. CLEAR all RCM DTCs.

Pinpoint Test J: DTC B2439 — Passengers Seat Belt Buckle Switch Resistance Out of Range

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors the passenger safety belt buckle switch circuits for faults. If the RCM detects a current out of range fault, it will store diagnostic trouble code (DTC) B2439 in memory and illuminate the air bag warning indicator.

Possible Causes

A passenger safety belt buckle switch current out of range fault can be caused by:

- damaged wiring, terminals or connectors.
- a faulty passenger safety belt buckle assembly.
- RCM is faulted.

PINPOINT TEST J: DTC B2439 — PASSENGERS SEAT BELT BUCKLE SWITCH RESISTANCE OUT OF RANGE

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough Inspection and Verification before proceeding with the Pinpoint Test.

Test Step	Result / Action to Take
J1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs	
• Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC B2439 retrieved?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to J2 . **No** This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. GO to J4 .
J2 CHECK SAFETY BELT BUCKLE SWITCH	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Safety Belt Buckle Switch C3066. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the passenger safety belt buckle switch disconnected, a open circuit fault would normally be retrieved. • **Did the passenger safety belt buckle switch on-demand DTC change from indicating B2439 to B2692?**	**Yes** INSTALL a new passenger safety belt buckle assembly. REFER to Section 501-20A . GO to J5 . **No** GO to J3 .
J3 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Passenger Safety Belt Buckle Switch C3066. • Repower the system. **Do not** prove out the	**Yes** INSTALL a new RCM and CARRY OUT programmable module installation (PMI). REFER to Restraints Control Module (RCM) in this section. GO to J5 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. GO to

system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC B2439 retrieved?**	J4 .
J4 CHECK FOR AN INTERMITTENT FAULT	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect the passenger safety belt buckle switch C3066: ▪ Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals. ▪ Inspect wire harness for any damage, pinched, cut or pierced wires. ▪ Repair any concerns found. REFER to Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. • Connect: All Previously Disconneced Component(s)/Connector(s). • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC B2439 retrieved?**	**Yes** This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to J2 . **No** The fault is not present and cannot be recreated at this time. GO to J5 .
J5 CHECK FOR ADDITIONAL DTCs	
• Refer to the continuous memory DTCs recorded during Step J1. • **Were any continuous memory DTCs retrieved during Step J1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. If previously directed to depower the system, REPOWER the system. REFER to Supplemental Restraint System (SRS) Depowering and Repowering in this section. PROVE OUT the system. CLEAR all RCM DTCs.

Pinpoint Test K: DTC B2691 — Seat Belt Buckle Switch Circuit Fault, Front Driver's Side

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors the safety belt buckle switch circuits for faults. If the RCM detects an open circuit or short to voltage fault, it will store diagnostic trouble code (DTC) B2691 in memory and illuminate the air bag warning indicator.

Possible Causes

A driver safety belt buckle switch open circuit or short to voltage fault can be caused by:

- damaged wiring, terminals or connectors.
- a faulty driver safety belt buckle assembly.
- a faulted RCM.

PINPOINT TEST K: DTC B2691 — SEAT BELT BUCKLE SWITCH CIRCUIT FAULT, FRONT DRIVER'S SIDE

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough Inspection and Verification before proceeding with the Pinpoint Test.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
K1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs	
• Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC B2691 retrieved?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to K2 . **No** This is an intermittent fault when present as a continuous

	memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. GO to K7 .
K2 CHECK CIRCUIT CR201 (BU/OG) FOR AN OPEN BETWEEN THE RCM AND DRIVER SAFETY BELT BUCKLE SWITCH • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b. • Disconnect: Driver Safety Belt Buckle Switch C3065. • Measure the resistance between RCM C310b-25, circuit CR201 (BU/OG), harness side and driver safety belt buckle switch C3065-1, circuit CR201 (BU/OG), harness side.  A0048705 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to K3 . **No** REPAIR circuit CR201 (BU/OG). GO to K8 .
K3 CHECK CIRCUIT GD133 (BK) FOR AN OPEN • Measure the resistance between driver safety belt buckle switch C3065-2, circuit GD133 (BK), harness side and ground.  A0048711 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to K4 . **No** REPAIR circuit GD133 (BK). GO to K8 .
K4 CHECK CIRCUIT CR201 (BU/OG) FOR A SHORT TO VOLTAGE • Disconnect: Driver Side Air Bag Module C3051. • Disconnect: Driver Safety Belt Buckle Pretensioner C3201. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Measure the voltage between driver safety belt buckle switch C3065-1, circuit CR201 (BU/OG), harness side and ground.	**Yes** GO to K5 . **No** REPAIR circuit CR201 (BU/OG). GO to K8 .

 A0048712 • **Is the voltage less than 0.2 volt?**	
K5 CHECK DRIVER SAFETY BELT BUCKLE SWITCH **NOTE:** This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Drive Side Air Bag Module C3051. • Connect: RCM C310a and C310b. • Connect a jumper wire between driver safety belt buckle switch C3065-1, circuit CR201 (BU/OG), harness side and C3065-2, circuit GD133 (BK), harness side. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the driver safety belt buckle switch circuits shorted together, a short to ground fault would normally be retrieved. • **Did the driver safety belt buckle switch on-demand DTC change from indicating B2691 to B2434?**	**Yes** INSTALL a new driver safety belt buckle assembly. REFER to Section 501-20A . GO to K8 . **No** GO to K6 .
K6 CONFIRM THE RCM FAULT **NOTE:** Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from driver safety belt buckle switch C3065. • Connect: Driver Safety Belt Buckle Switch C3065. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC B2691 retrieved?**	**Yes** INSTALL a new RCM and CARRY OUT programmable module installation (PMI). REFER to Restraints Control Module (RCM) in this section. GO to K8 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. GO to K7 .
K7 CHECK FOR AN INTERMITTENT FAULT	

• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Belt Buckle Pretensioner C3201. • Disconnect: Driver Side Air Bag Module C3051. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC B2691 retrieved?**	**Yes** This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to K2. **No** CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to K8.
K8 CHECK FOR ADDITIONAL DTCs	
• Refer to the continuous memory DTCs recorded during Step K1. • **Were any continuous memory DTCs retrieved during Step K1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. If previously directed to depower the system, REPOWER the system. REFER to Supplemental Restraint System (SRS) Depowering and Repowering in this section. PROVE OUT the system. CLEAR all RCM DTCs.

Pinpoint Test L: DTC B2692 — Front Passenger's Safety Belt Buckle Switch Circuit Fault

Refer to Wiring Diagrams Cell 46, Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors the passenger safety belt buckle switch circuits for faults. If the RCM detects an open circuit or short to voltage fault, it will store diagnostic trouble code (DTC) B2692 in memory and illuminate the air bag warning indicator.

Possible Causes

A passenger safety belt buckle switch open circuit or short to voltage fault can be caused by:

- damaged wiring, terminals or connectors.
- a faulty passenger safety belt buckle assembly.
- RCM is faulted.

PINPOINT TEST L: DTC B2692 — FRONT PASSENGER'S SAFETY BELT BUCKLE SWITCH CIRCUIT FAULT

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough Inspection and Verification before proceeding with the Pinpoint Test.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
L1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs	
• Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC B2692 retrieved?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to L2 . **No** This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. GO to L7 .
L2 CHECK CIRCUIT CR202 (BN/GN) FOR AN OPEN BETWEEN THE RCM AND PASSENGER SAFETY BELT BUCKLE SWITCH	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b. • Disconnect: Passenger Safety Belt Buckle Switch C3066. • Measure the resistance between RCM C310b-26, circuit CR202 (BN/GN), harness side and the passenger safety belt buckle switch C3066-1, circuit CR202 (BN/GN), harness side.	**Yes** GO to L3 . **No** REPAIR circuit CR202 (BN/GN). GO to L8 .

 A0048715 • **Is the resistance less than 0.5 ohm?**	
L3 CHECK CIRCUIT GD133 (BK) FOR AN OPEN	
• Measure the resistance between passenger safety belt buckle switch C3066-2, circuit GD133 (BK), harness side and ground.  A0048711 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to L4 . **No** REPAIR circuit GD133 (BK). GO to L8 .
L4 CHECK CIRCUIT CR202 (BN/GN) FOR A SHORT TO VOLTAGE	
• Disconnect: Passenger Side Air Bag Module C3052. • Disconnect: Passenger Safety Belt Buckle Pretensioner C3202. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Measure the voltage between passenger seat belt buckle switch C3066-1, circuit CR202 (BN/GN), harness side and ground.  A0048712 • **Is the voltage less than 0.2 volt?**	**Yes** GO to L5 . **No** REPAIR circuit CR202 (BN/GN). GO to L8 .
L5 CHECK SAFETY BELT BUCKLE SWITCH	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.	**Yes** INSTALL a new passenger safety belt buckle assembly. REFER to Section 501-20A . GO to L8 .

• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Passenger Side Air Bag Module C3052. • Connect: RCM C310a and C310b. • Connect a jumper wire between passenger safety belt buckle switch C3066-1, circuit CR202 (BN/GN), harness side and C3066-2, circuit GD133 (BK), harness side. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the passenger safety belt buckle switch circuits shorted together, a short to ground fault would normally be retrieved. • **Did the passenger safety belt buckle switch on-demand DTC change from indicating B2692 to B2438?**	**No** GO to L6 .
L6 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from driver safety belt buckle switch C3065. • Connect: Passenger Safety Belt Buckle Switch C3066. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC B2692 retrieved?**	**Yes** INSTALL a new RCM and CARRY OUT programmable module installation (PMI). REFER to Restraints Control Module (RCM) in this section. GO to L8 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. GO to L7 .
L7 CHECK FOR AN INTERMITTENT FAULT	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Safety Belt Buckle Pretensioner C3202. • Disconnect: Passenger Side Air Bag Module C3052. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC B2692 retrieved?**	**Yes** This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to L2 . **No** CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to L8 .
L8 CHECK FOR ADDITIONAL DTCs	
• Refer to the continuous memory DTCs recorded during	**Yes**

Step L1. • **Were any continuous memory DTCs retrieved during Step L1?**	Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. If previously directed to depower the system, REPOWER the system. REFER to Supplemental Restraint System (SRS) Depowering and Repowering in this section. PROVE OUT the system. CLEAR all RCM DTCs.

Pinpoint Test M: DTC B2792 — Cross Link Between Firing Loops

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors all the deployable devices for a cross link between the circuits of another deployable device. If the RCM detects a short between the circuits of the deployable devices, it will store diagnostic trouble code (DTC) B2792 and illuminate the air bag warning indicator.

Possible Causes

A cross link fault between the circuits of deployable devices can be caused by:

- damaged wiring, terminals or connectors.
- a faulted RCM.

PINPOINT TEST M: DTC B2792 — CROSS LINK BETWEEN FIRING LOOPS

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment.

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough Inspection and Verification before proceeding with the pinpoint test.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Yes
INSTALL a new RCM and CARRY OUT programmable module installation (PMI). REFER to Restraints Control Module (RCM) in this section. GO to M5 .

No
In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were

	disconnected. GO to M4 .
M4 CHECK FOR AN INTERMITTENT FAULT	

• Key in OFF position.
• Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• If a cross link fault for driver air bag loop 1 or loop 2 is present continuous:
  ▪ remove the driver air bag module. Refer to Driver Air Bag Module in this section.
• If a cross link fault for passenger air bag module loop 1 or loop 2 is present continuous:
  ▪ disconnect the passenger air bag module C256.
• If a cross link fault for driver side air bag is present continuous:
  ▪ disconnect the driver side air bag module C3051.
• If a cross link fault for passenger side air bag is present continuous:
  ▪ disconnect the passenger side air bag module C3052.
• If a cross link fault for driver safety canopy module is present continuous:
  ▪ disconnect the driver safety canopy module C9006.
• If a cross link fault for passenger safety canopy module is present continuous:
  ▪ disconnect the passenger safety canopy module C9007.
• If a cross link fault for driver safety belt buckle pretensioner is present continuous:
  ▪ disconnect the driver safety belt buckle pretensioner C3201.
• If a cross link fault for passenger safety belt buckle pretensioner is present continuous:
  ▪ disconnect the passenger safety belt buckle pretensioner C3202.
• Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs.
• Enter the following diagnostic mode on the diagnostic tool: DataLogger/View and Record DTC B2792 Fault PIDs.
• **Was on-demand DTC B2792 retrieved?**
	Yes
	This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to M2 .
	
	No
	CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to M5 .

M5 CHECK FOR ADDITIONAL DTCs	
• Refer to the continuous memory DTCs recorded during Step M1. • **Were any continuous memory DTCs retrieved during Step M1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. If previously directed to depower the system, REPOWER the system. REFER to Supplemental Restraint System (SRS) Depowering and Repowering

	in this section. PROVE OUT the system. CLEAR all RCM DTCs.

Pinpoint Test N: LFC 15/DTC C1414 — Incorrect Module Design Level

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

NOTE: When a new PCM is installed, the air bag warning indicator will illuminate when the ignition switch is ON. The warning indicator will remain on until PCM configuration is restored.

Normal Operation

The restraints control module (RCM) monitors the communication from the powertrain control module (PCM) for an embedded vehicle ID. If the RCM detects an unexpected condition or incorrect data from the PCM, it will store diagnostic trouble code (DTC) C1414 in memory and illuminate the air bag warning indicator.

Possible Causes

An incorrect module design level can be caused by:

- incorrect or non configured PCM for vehicle.
- incorrect RCM for vehicle.

PINPOINT TEST N: LFC 15/DTC C1414 — INCORRECT MODULE DESIGN LEVEL

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough Inspection and Verification before proceeding with the Pinpoint Test.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
N1 CHECK FOR CONTINUOUS OR ON-DEMAND DTCs	
• Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC C1414 retrieved?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to N2 . **No** The fault condition is not present at this time. CLEAR the DTC and GO to N4 .
N2 CHECK RCM PART NUMBER	
• Enter the following diagnostic mode on the diagnostic tool: Network Test. • Enter the following diagnostic mode on the diagnostic tool: Log Viewer . • **Did the RCM part number in the log viewer match the part number listed in the master parts catalog?**	**Yes** GO to N3 . **No** INSTALL a new RCM with the correct part number. REFER to Restraints Control Module (RCM) in this section. GO to N4 .
N3 CHECK PCM PART NUMBER	
• Enter the following diagnostic mode on the diagnostic tool: Log Viewer . • **Did the PCM part number in the log viewer match the part number listed in the master parts catalog?**	**Yes** This indicates that a new PCM has been installed and is not yet configured. CARRY OUT the programmable module installation (PMI). GO to N4 . **No** INSTALL a new PCM with the correct part number. GO to N4 .
N4 CHECK FOR ADDITIONAL DTCs	
• Refer to the continuous memory DTCs recorded during Step N1. • **Were any continuous memory DTCs retrieved during Step N1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. If previously directed to deactivate the system, REACTIVATE the system. REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. REPOWER the system. REFER to Supplemental Restraint System (SRS) Depowering and Repowering in this section. PROVE OUT the system. CLEAR all DTCs.

Pinpoint Test O: DTC C1946 — Front Driver's Seat Track Position Switch Circuit Open

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors the driver seat track position sensor circuits. If the RCM detects an open circuit, it will store diagnostic trouble code (DTC) C1946 in memory and illuminate the

air bag warning indicator.

Possible Causes

A driver seat track position sensor open circuit fault can be caused by:

- damaged wiring, terminals or connectors.
- a faulty driver seat track position sensor.
- RCM is faulted.

PINPOINT TEST O: DTC C1946 — FRONT DRIVER'S SEAT TRACK POSITION SWITCH CIRCUIT OPEN

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough Inspection and Verification before proceeding with the Pinpoint Test.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
O1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs	
• Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC C1946 retrieved?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to O2 . **No** This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. GO to O6 .

O2 CHECK DRIVER SEAT TRACK POSITION SENSOR FOR AN OPEN	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Seat Track Position Sensor C356. • Connect a jumper wire between driver seat track position sensor C356-2, circuit VR215 (YE/VT), harness side and C356-1, circuit GD133 (BK), harness side. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the driver seat track position sensor circuits shorted together, a short to ground fault would normally be retrieved. • **Did the driver seat track position switch on-demand DTC change from indicating C1946 to C1947?**	**Yes** INSTALL a new driver seat track position sensor. REFER to Seat Position Sensor in this section. GO to O7. **No** GO to O3.
O3 CHECK CIRCUIT VR215 (YE/VT) FOR AN OPEN BETWEEN THE RCM AND DRIVER SEAT	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b. • Remover the jumper wire from the driver seat track position sensor C356. • Measure the resistance between RCM C310b-23, circuit VR215 (YE/VT), harness side and driver seat track position sensor C356-2, circuit VR215 (YE/VT), harness side.  A0048716 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to O4. **No** REPAIR circuit VR215 (YE/VT). GO to O7.
O4 CHECK CIRCUIT GD133 (BK) FOR AN OPEN	
• Measure the resistance between driver seat track position sensor C356-1, circuit GD143 (BK/VT) and ground.	**Yes** GO to O5. **No** REPAIR circuit GD133 (BK). GO to O7.

 A0088601 • **Is the resistance less than 0.5 ohm?**	
O5 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Driver Seat Track Position Sensor C356. • Connect: RCM C310a and C310b. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC C1946 retrieved?**	**Yes** INSTALL a new RCM and CARRY OUT programmable module installation (PMI). REFER to Restraints Control Module (RCM) in this section. GO to O7 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. GO to O6 .
O6 CHECK FOR AN INTERMITTENT FAULT	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Belt Buckle Pretensioner C3201. • Disconnect: Driver Side Air Bag Module C3051. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC C1946 retrieved?**	**Yes** This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to O2 . **No** CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to O7 .
O7 CHECK FOR ADDITIONAL DTCs	
• Refer to the continuous memory DTCs recorded during Step O1. • **Were any continuous memory DTCs retrieved during Step O1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No**

	RECONNECT the system. If previously directed to depower the system, REPOWER the system. REFER to Supplemental Restraint System (SRS) Depowering and Repowering in this section. PROVE OUT the system. CLEAR all RCM DTCs.

Pinpoint Test P: DTC C1947 — Front Driver's Seat Track Position Switch Circuit Short to Ground

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors the driver seat track position sensor circuits. If the RCM detects a short to ground, it will store diagnostic trouble code (DTC) C1947 in memory and illuminate the air bag warning indicator.

Possible Causes

A driver seat track position sensor short to ground fault can be caused by:

- damaged wiring, terminals or connectors.
- a faulty driver seat track position sensor.
- RCM is faulted.

PINPOINT TEST P: DTC C1947 — FRONT DRIVER'S SEAT TRACK POSITION SWITCH CIRCUIT SHORT TO GROUND

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough Inspection and Verification before proceeding with the Pinpoint Test.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
P1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs	
• Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC C1947 retrieved?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to P2 . **No** This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. GO to P5 .
P2 CHECK SEAT TRACK POSITION SENSOR FOR A SHORT TO GROUND	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Seat Track Position Sensor C356. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the driver seat track position sensor disconnected, an open circuit fault would normally be retrieved. • **Did the driver seat track position switch on-demand DTC change from indicating C1947 to C1946?**	**Yes** INSTALL a new driver seat track position sensor. REFER to Seat Position Sensor in this section. GO to P6 . **No** GO to P3 .
P3 CHECK CIRCUIT VR215 (YE/VT) FOR A SHORT TO GROUND BETWEEN THE RCM AND SEAT TRACK POSITION SENSOR	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b. • Measure the resistance between driver seat track position sensor C356-2, circuit VR215 (YE/VT) and ground.	**Yes** GO to P4 . **No** REPAIR circuit VR215 (YE/VT). GO to P6 .

 N0056815 • **Is the resistance greater than 1,000,000 ohms?**	
P4 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Seat Track Position Sensor C356. • Connect: RCM C310a and C310b. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC C1947 retrieved?**	**Yes** INSTALL a new RCM and CARRY OUT programmable module installation (PMI). REFER to Restraints Control Module (RCM) in this section. GO to P6 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. GO to P5 .
P5 CHECK FOR AN INTERMITTENT FAULT	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Belt Buckle Pretensioner C3201. • Disconnect: Driver Side Air Bag Module C3051. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC C1947 retrieved?**	**Yes** This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to P2 . **No** CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to P6 .
P6 CHECK FOR ADDITIONAL DTCs	
• Refer to the continuous memory DTCs recorded during Step P1. • **Were any continuous memory DTCs retrieved during Step P1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No**

	RECONNECT the system. If previously directed to depower the system, REPOWER the system. REFER to Supplemental Restraint System (SRS) Depowering and Repowering in this section. PROVE OUT the system. CLEAR all RCM DTCs.

Pinpoint Test Q: DTC C1948 — Front Driver's Seat Track Position Switch Circuit Resistance Out of Range

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors the driver seat track position sensor circuits. If the RCM detects a current out of range condition, it will store diagnostic trouble code (DTC) C1948 in memory and illuminate the air bag warning indicator.

Possible Causes

A driver seat track position sensor circuit resistance out of range fault can be caused by:

- damaged wiring, terminals or connectors.
- a faulty driver seat track position sensor.
- RCM is faulted.

PINPOINT TEST Q: DTC C1948 — FRONT DRIVER'S SEAT TRACK POSITION SWITCH CIRCUIT RESISTANCE OUT OF RANGE

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough Inspection and Verification before proceeding with the Pinpoint Test.

NOTE: Due to the seat track position sensor being a Hall-effect type sensor, this pinpoint test will be diagnosing a current out of range fault instead of the current diagnostic trouble code (DTC) definition for a resistance out of range fault.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
Q1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs	
• Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC C1948 retrieved?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to Q2 . **No** This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. GO to Q4 .
Q2 CHECK DRIVER SEAT TRACK POSITION SENSOR	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Seat Track Position Sensor C356. • Connect a jumper wire between driver seat track position sensor C356-2, circuit VR215 (YE/VT), harness side and C356-1, circuit GD133 (BK), harness side. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the driver seat track position sensor circuits shorted together, a short to ground fault would normally be retrieved. • **Did the driver seat track position sensor on-demand DTC change from indicating C1948 to C1947?**	**Yes** INSTALL a new driver seat track position sensor. REFER to Seat Position Sensor in this section. GO to Q5 . **No** GO to Q3 .
Q3 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are	**Yes** INSTALL a new RCM and CARRY OUT programmable module installation (PMI).

connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Driver Seat Track Position Sensor C356. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC C1948 retrieved?**	REFER to Restraints Control Module (RCM) . GO to Q5 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. GO to Q4 .
Q4 CHECK FOR AN INTERMITTENT FAULT	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Belt Buckle Pretensioner C3201. • Disconnect: Driver Side Air Bag Module C3051. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC C1948 retrieved?**	**Yes** This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to Q2 . **No** CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to Q5 .
Q5 CHECK FOR ADDITIONAL DTCs	
• Refer to the continuous memory DTCs recorded during Step Q1. • **Were any continuous memory DTCs retrieved during Step Q1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. If previously directed to depower the system, REPOWER the system. REFER to Supplemental Restraint System (SRS) Depowering and Repowering in this section. PROVE OUT the system. CLEAR all RCM DTCs.

Pinpoint Test R: DTC C1981 — Front Driver's Seat Track Position Switch Circuit Fault

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors the driver seat track position sensor circuits. If the RCM detects a short to battery, it will store diagnostic trouble code (DTC) C1981 in memory and illuminate the air bag warning indicator.

Possible Causes

A driver seat track position sensor short to battery fault can be caused by:

- damaged wiring, terminals or connectors.
- RCM is faulted.

PINPOINT TEST R: DTC C1981 — FRONT DRIVER'S SEAT TRACK POSITION SWITCH CIRCUIT FAULT

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough Inspection and Verification before proceeding with the Pinpoint Test.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
R1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs	
• Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC C1981 retrieved?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to R2 . **No** This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this

	time. GO to R4 .
R2 CHECK CIRCUIT VR215 (YE/VT) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b. • Disconnect: Driver Seat Track Position Sensor C356. • Disconnect: Driver Side Air Bag Module C3051. • Disconnect: Driver Safety Belt Buckle Pretensioner C3201. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Key in ON position. • Measure the voltage between driver seat track position sensor C356-2, circuit VR215 (YE/VT), harness side and ground.  A0088603 • **Is the voltage less than 0.2 volt?**	**Yes** GO to R3 . **No** REPAIR circuit VR215 (YE/VT). GO to R5 .
R3 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: RCM C310a and C310b. • Connect: Driver Seat Track Position Sensor C356. • Repower the system. **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC C1981 retrieved?**	**Yes** INSTALL a new RCM and CARRY OUT programmable module installation (PMI). REFER to Restraints Control Module (RCM) in this section. GO to R5 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. GO to R4 .
R4 CHECK FOR AN INTERMITTENT FAULT	
• Key in OFF position. • Depower the system. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Belt Buckle Pretensioner C3201. • Disconnect: Driver Side Air Bag Module C3051. • Repower the system. **Do not** prove out the system at this	**Yes** This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to R2 . **No**

time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the diagnostic tool: Self Test/Retrieve and Record On-Demand and Continuous Memory DTCs. • **Was on-demand DTC C1981 retrieved?**	CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to R5 .
R5 CHECK FOR ADDITIONAL DTCs	
• Refer to the continuous memory DTCs recorded during Step R1. • **Were any continuous memory DTCs retrieved during Step R1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. If previously directed to depower the system, REPOWER the system. REFER to Supplemental Restraint System (SRS) Depowering and Repowering in this section. PROVE OUT the system. CLEAR all RCM DTCs.

Supplemental Restraint System (SRS) Depowering and Repowering

Printable
View (91 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Depowering Procedure

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Turn all vehicle accessories OFF.
2. Turn the ignition switch to OFF.
3. At the smart power distribution junction box (SPDJB), located in the RH lower kick panel, remove the cover and the restraints control module (RCM) fuse 32 (10A) from the SPDJB. For additional information, refer to the Wiring Diagram Manual.
4. Turn the ignition ON and visually monitor the air bag warning indicator for at least 30 seconds. The air bag warning indicator will remain lit continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain lit continuously, remove the correct RCM fuse before proceeding.
5. Turn the ignition switch to OFF.
6. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

The front impact severity sensor is located on the bottom of the radiator support bracket.

The front door side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

The C-pillar side impact sensors (if equipped) are located on the C-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped). Failure to follow these instructions may increase the risk of personal injury or death in a crash.

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to Section 414-01 .

Repowering Procedure

1. Make sure that all supplemental restraint system (SRS) components are connected.

2. Turn the ignition switch from OFF to ON.

3. Install restraints control module (RCM) fuse 32 (10A) to the SPDJB and close the cover.

4. **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected. Failure to follow these instructions may increase the risk of personal injury or death in a crash.**

   Connect the battery ground cable.

5. Prove out the SRS as follows:
   Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag warning indicator will either:
   - fail to light.
   - remain lit continuously.
   - flash.

   The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and an SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator will need to be repaired before diagnosis can continue.
   Clear all continuous memory DTCs from the restraints control module using a scan tool.

Supplemental Restraint System (SRS) Deactivation and Reactivation

Printable
View (579 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Deactivation

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Do not set a live air bag module down with the trim cover face down. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: Never probe the connectors on the safety canopy module. Doing so can result in safety canopy deployment, which can result in personal injury.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

All vehicles

1. Turn all vehicle accessories off.

2. Turn the ignition switch to OFF.

3. At the smart power distribution junction box (SPDJB), located in the RH lower kick panel, remove the cover and the restraints control module (RCM) fuse 32 (10A) from the SPDJB. For additional information, refer to the Wiring Diagram Manual.

4. Turn the ignition ON and visually monitor the air bag warning indicator for at least 30 seconds. The air bag warning indicator will remain lit continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain lit continuously, remove the correct RCM fuse before proceeding.

5. Turn the ignition OFF.

6. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located on the bottom of the radiator support bracket.

   The front door side impact sensors are located in the first row doors, behind the door trim panel.

   The C-pillar side impact sensors (if equipped) are located on the C-pillar.

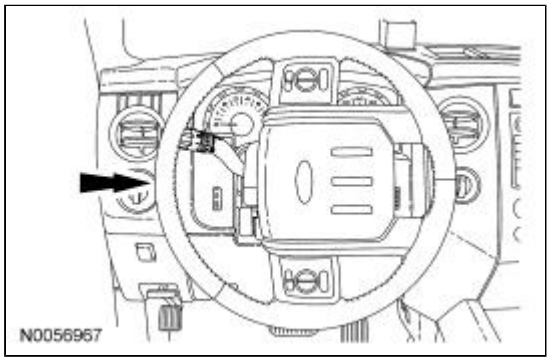
   To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped). Failure to follow these instructions may increase the risk of personal injury or death in a crash.

   Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

7. Make sure the road wheels are in the straight-ahead position.

8. Center the tilt steering column.

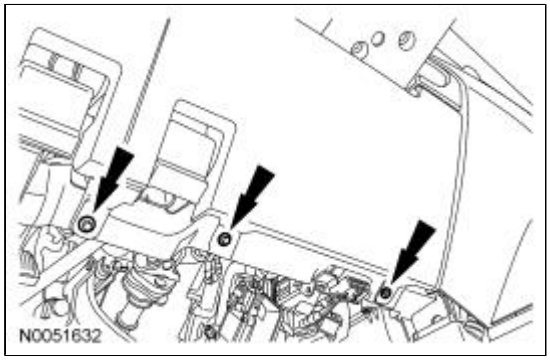
9. Turn the steering wheel so the top of the wheel is 90 degrees to the left (at the 9 o'clock position).



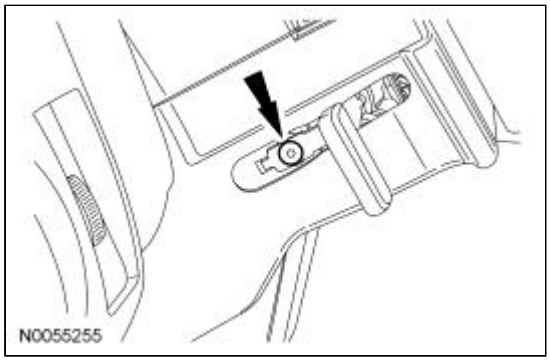
Vehicles with manual tilt wheel

10. Remove the lower steering column opening cover.

- Remove the 3 screws and pull out to release the top retaining clips and remove the lower steering column opening cover.



11. Remove the screw and steering column manual tilt lever.



All vehicles

12. Remove the 3 steering column lower shroud screws.

13. Release the clips and remove the steering column upper shroud.

14. Remove the steering column lower shroud.
    - If equipped, disconnect the power tilt steering column switch located on the lower shroud.

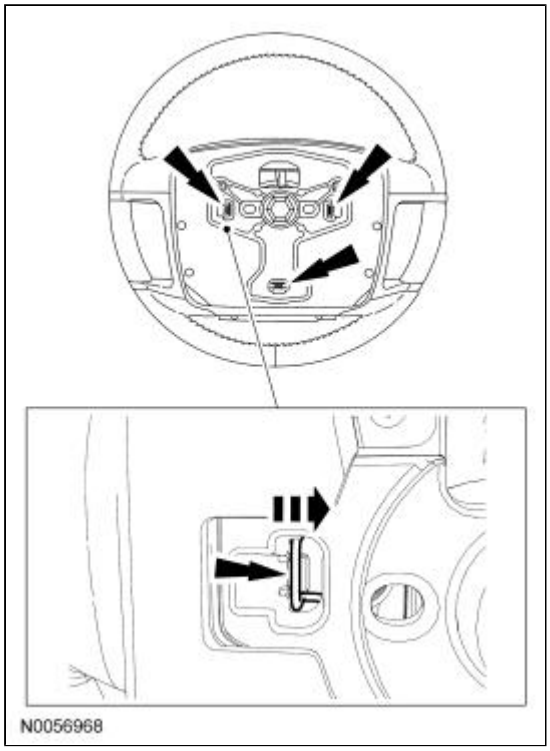
15. **CAUTION: Make sure each of the 3 driver air bag module wire clips are disengaged from each of the 3 steering wheel hooks before removing the driver air bag module from the steering wheel. Failure to do so will damage the driver air bag module and steering wheel.**

    NOTE: Steering wheel is removed for clarity. The rear of the steering wheel is shown.

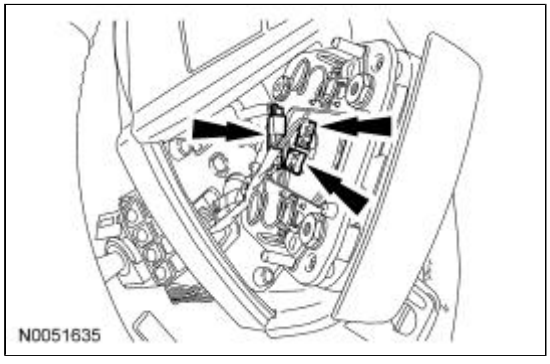
    NOTE: Use a mirror to look at the rear of the steering wheel to locate where the 3 driver air bag module wire clips attach to the steering wheel hooks.

    NOTE: Note the position of the 2 driver air bag module locator pins to the steering wheel for installation.

    Using a screwdriver or a suitable tool, release each of the 3 driver air bag module wire clips from the steering wheel hooks.
    - Access the 3 driver air bag module wire clips through the back of the steering wheel cover and push the wire clips toward the center of the steering wheel to release.



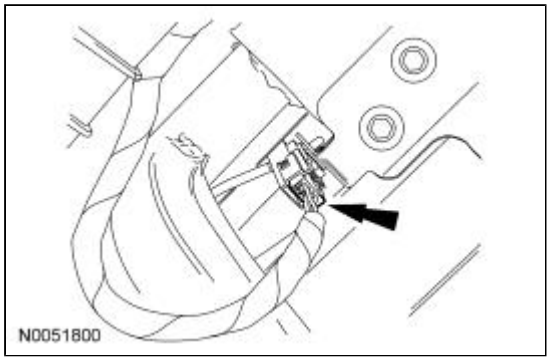
16. Disconnect the 2 driver air bag module electrical connectors, then disconnect the horn switch electrical connector and remove the driver air bag module.



17. Turn the steering wheel so the top of the wheel is back in the straight ahead position (the 12 o'clock position).

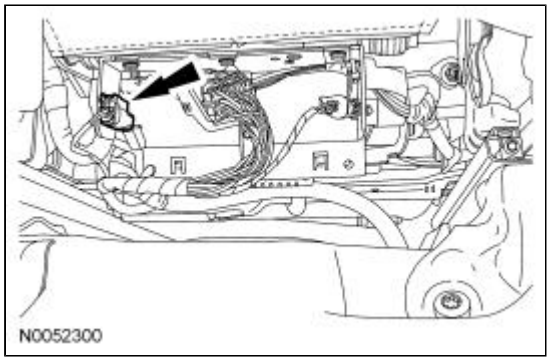
18. Open and lower the glove compartment door.
    - If equipped, disconnect the glove compartment door dampener.

19. Disconnect the passenger air bag module electrical connector.

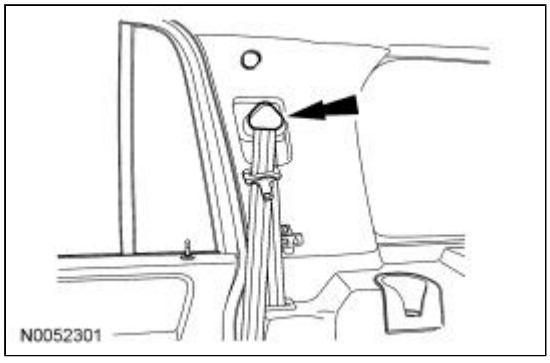


20. **NOTE:** There are 2 similar connectors under the passenger seat. The passenger seat side air bag module electrical connector is located toward the seat outboard position.

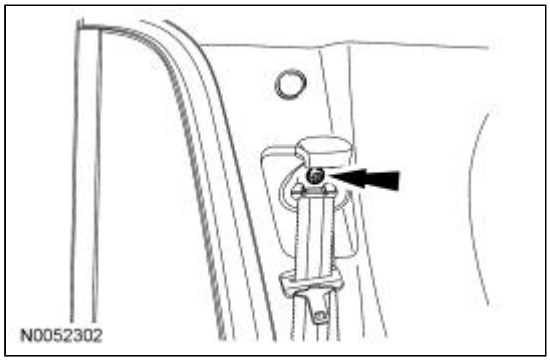
    Remove the passenger front seat cushion panel shield and disconnect the passenger seat side air bag module electrical connector.



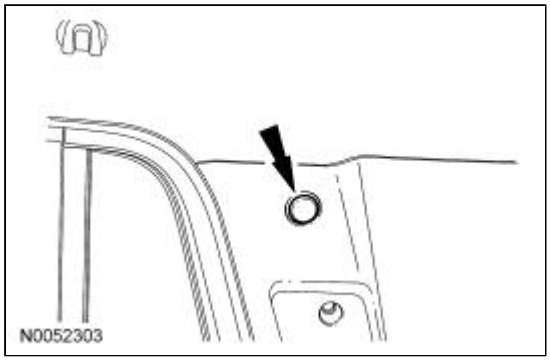
21. Release the passenger side second row safety belt retractor D-ring cover.



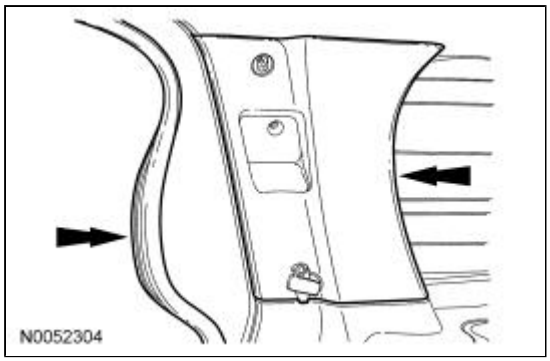
22. Remove the bolt and the passenger side second row safety belt retractor D-ring.



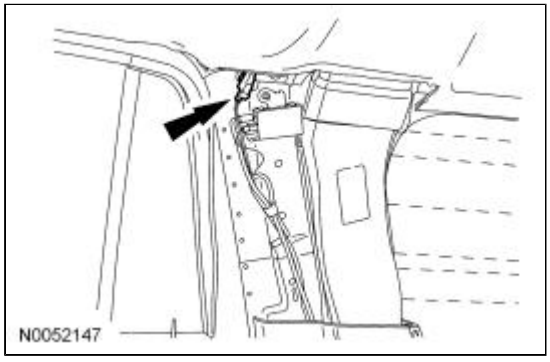
23. Remove the cover and the passenger side C-pillar trim panel nut.



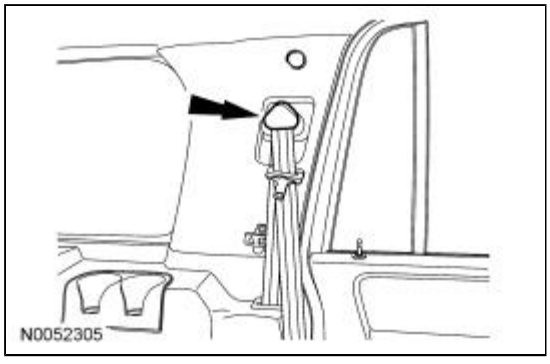
24. Release the rear door weatherstrip and remove the passenger side C-pillar trim panel.



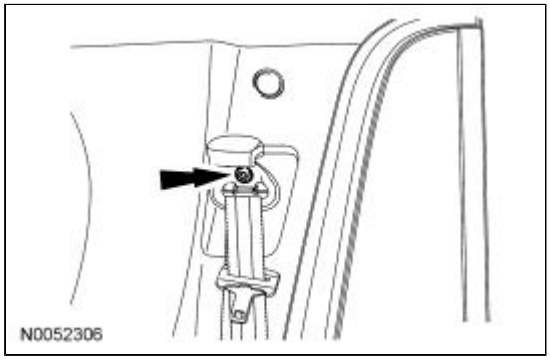
25. Disconnect the passenger side safety canopy module electrical connector.



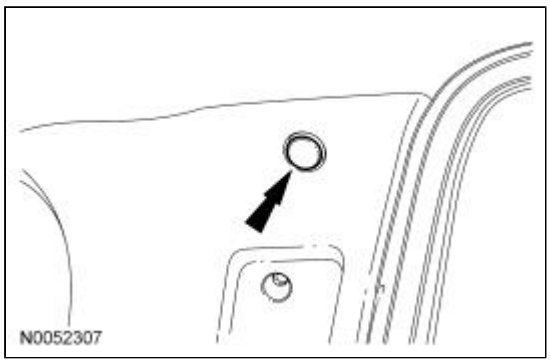
26. Release the driver side second row safety belt retractor D-ring cover.



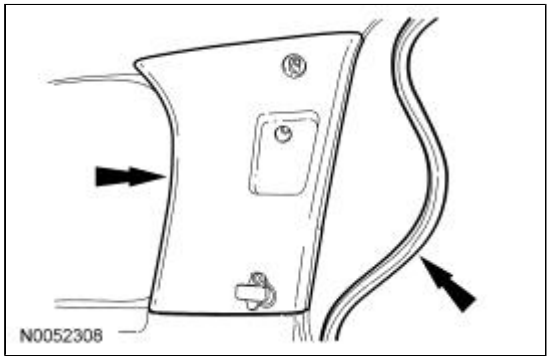
27. Remove the bolt and the driver side second row safety belt retractor D-ring.



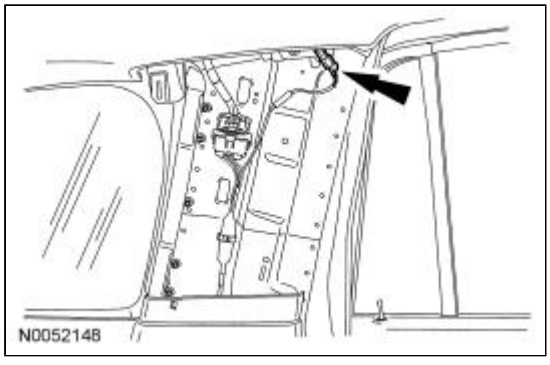
28. Remove the cover and the driver side C-pillar trim panel nut.



29. Release the rear door weatherstrip and remove the driver side C-pillar trim panel.

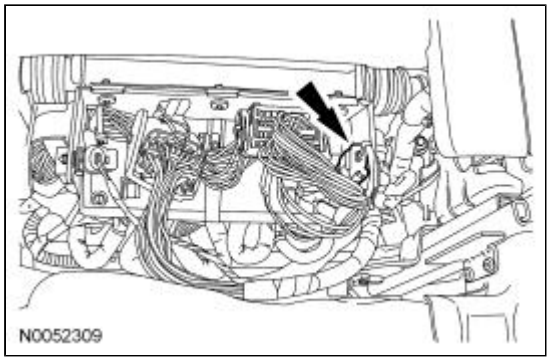


30. Disconnect the driver side safety canopy module electrical connector.



31. **NOTE:** There are 2 similar connectors under the driver seat. The driver seat side air bag module electrical connector is located toward the seat outboard position.

    Remove the driver front seat cushion panel shield and disconnect the driver seat side air bag module electrical connector.



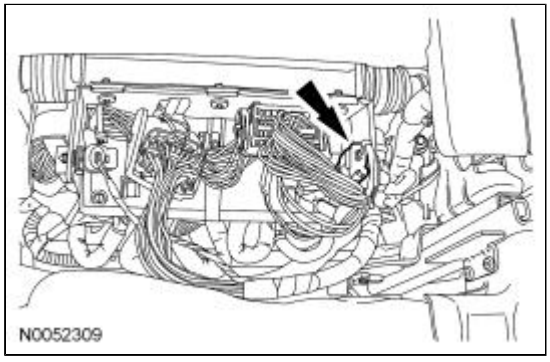
32. Install the RCM fuse 32 (10A) to the SPDJB.

33. Connect the battery ground cable. For additional information, refer to Section 414-01 .

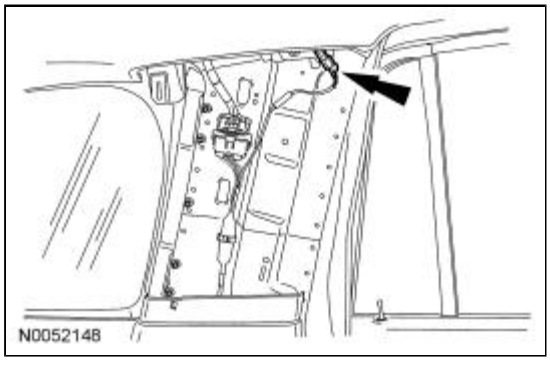
Reactivation

All vehicles

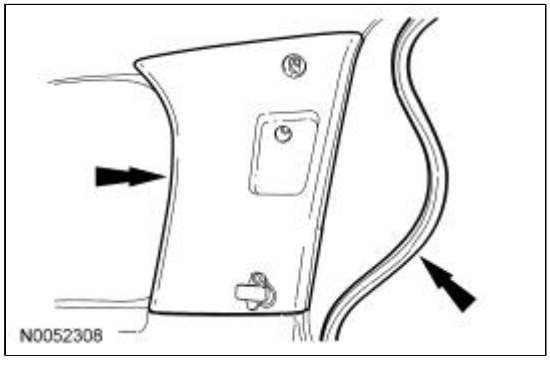
1. Remove the RCM fuse 32 (10A) from the SPDJB.
2. Disconnect the battery ground cable and wait at least one minute.
3. Connect the driver seat side air bag module electrical connector and install the driver front seat cushion panel shield.



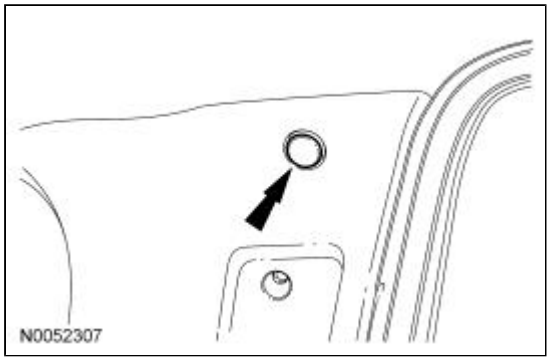
4. Connect the driver side safety canopy module electrical connector.



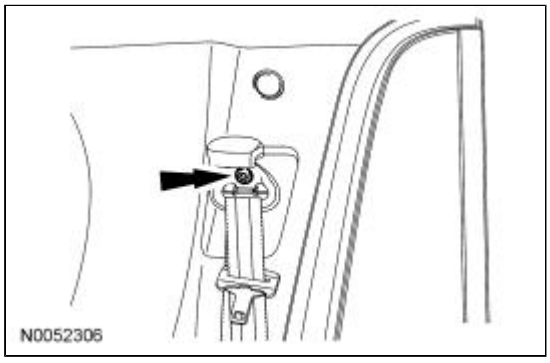
5. Install the driver side C-pillar trim panel and attach the rear door weatherstrip.



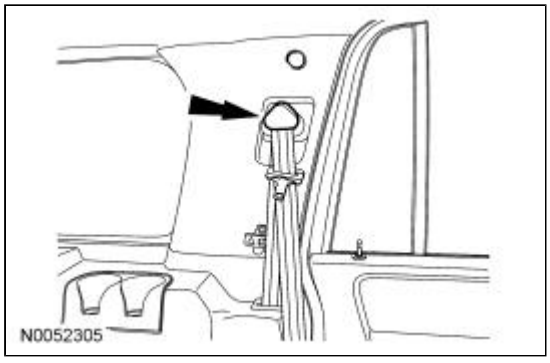
6. Install the driver side C-pillar trim panel nut and cover.



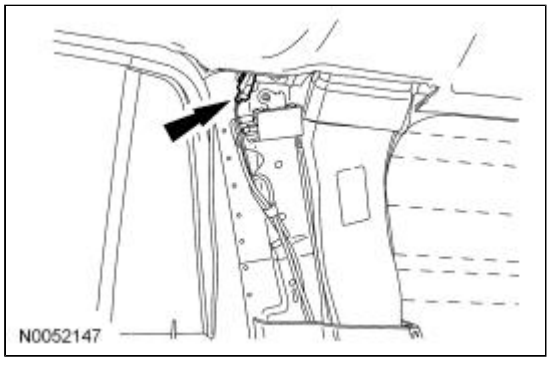
7. Install the driver side second row safety belt retractor D-ring and bolt.
    - Tighten to 40 Nm (30 lb-ft).



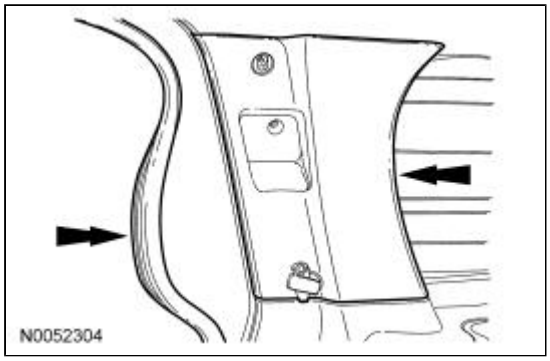
8. Attach the driver side second row safety belt retractor D-ring cover.
    - Verify the safety belt retractor operates without excessive effort or binding.



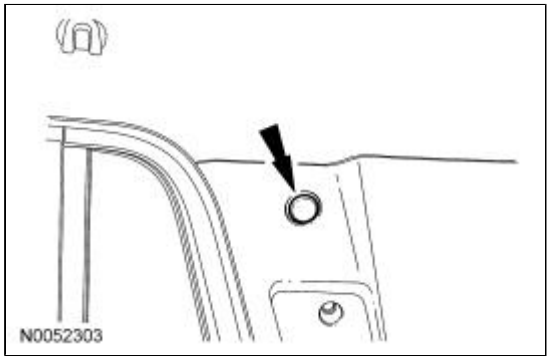
9. Connect the passenger side safety canopy module electrical connector.



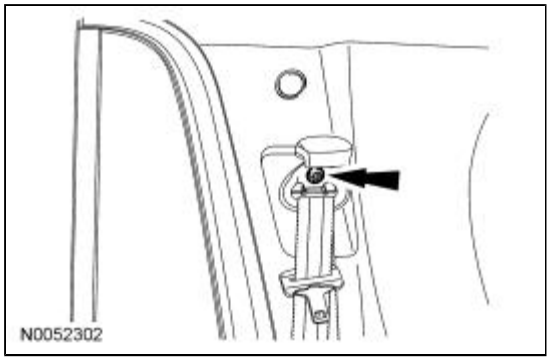
10. Install the passenger side C-pillar trim panel and attach the rear door weatherstrip.



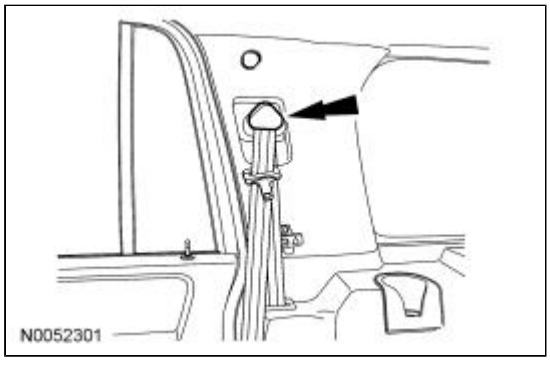
11. Install the passenger side C-pillar trim panel nut and cover.



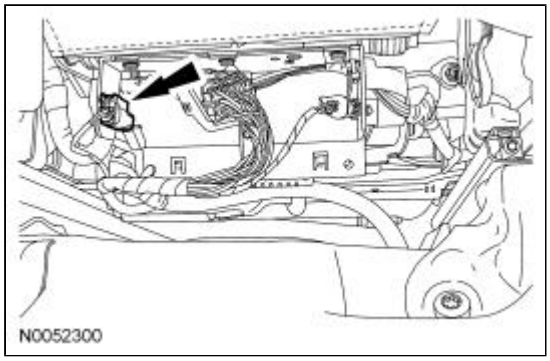
12. Install the passenger side second row safety belt retractor D-ring and bolt.
    - Tighten to 40 Nm (30 lb-ft).



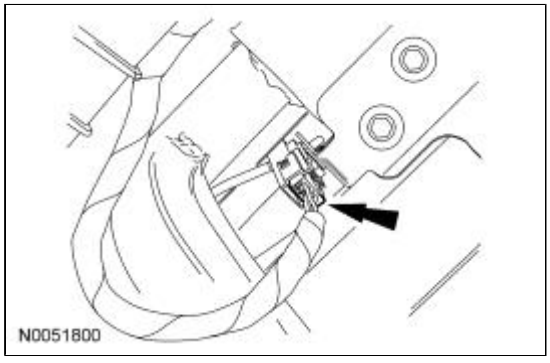
13. Attach the passenger side second row safety belt retractor D-ring cover.
    - Verify the safety belt retractor operates without excessive effort or binding.



14. Connect the passenger seat side air bag module electrical connector and install the passenger front seat cushion panel shield.



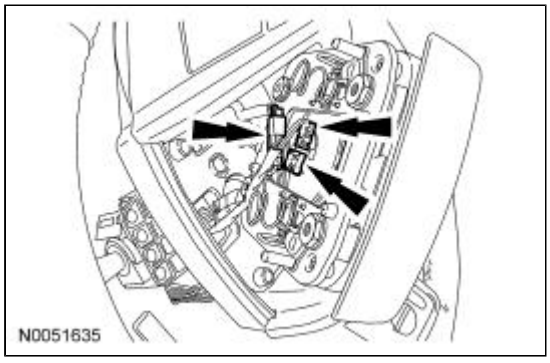
15. Connect the passenger air bag module electrical connector.



16. Close the glove compartment door.
    - If equipped, connect the glove compartment door dampener.

17. **CAUTION: The clockspring electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module.**

    Connect the horn switch electrical connector, then connect the 2 driver air bag module electrical connectors.



18. Position the driver air bag module to the steering wheel, lining up the locator pins.

19. **NOTE:** Make sure that all 3 driver air bag module wire clips are fully engaged and seated correctly to the steering wheel.

    NOTE: Audible clicks will be heard when the 3 driver air bag module wire clips are fully engaged.

    Firmly press the driver air bag module to the steering wheel, seating the 3 driver air bag module wire clips to the steering wheel hooks.

- Check the driver air bag module trim cover to the steering wheel for an even gap clearance and correct movement.

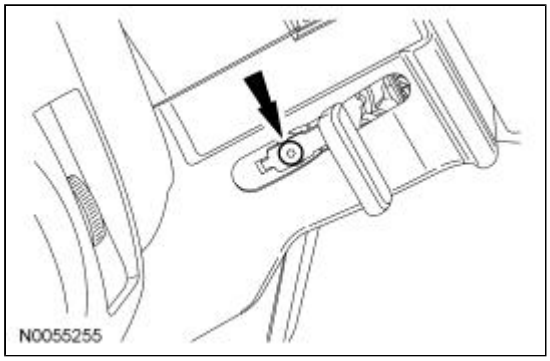
20. Install the steering column lower shroud.
    - If equipped, connect the power tilt steering column switch located on the lower shroud.

21. Install the steering column upper shroud.

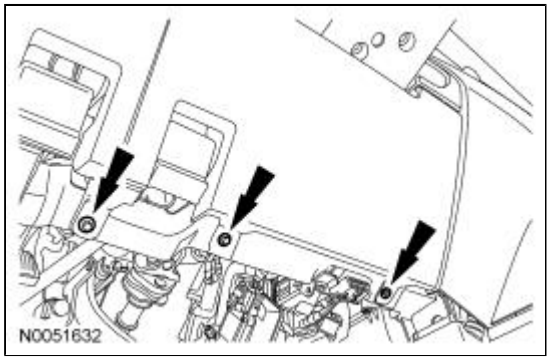
22. Install the 3 steering column lower shroud screws.

Vehicles with manual tilt wheel

23. Install the steering column manual tilt lever and screw.
    - Tighten to 6 Nm (53 lb-in).



24. Install the lower steering column opening cover and the 3 screws.



All vehicles

25. Turn the ignition switch from OFF to ON.

26. Install the RCM fuse 32 (10A) to the SPDJB and install the cover.

27. **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.**

    Connect the battery ground cable.

28. Prove out the SRS as follows:
    Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag warning indicator will either:

- fail to light.
- remain lit continuously.
- flash.

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and an SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator will need to be repaired before diagnosis can continue.

Clear all continuous memory DTCs from the restraints control module using a scan tool.

Inspection and Repair After a Supplemental Restraint System (SRS) Deployment

Printable View (85 KB)

WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

NOTE: After diagnosing or repairing a supplemental restraint system (SRS), **the restraint system diagnostic tools (if required) must be removed before operating the vehicle over the road.**

NOTE: After diagnosing or repairing a seat system, **the restraint system diagnostic tools (if required) must be removed before operating the vehicle over the road.**

NOTE: Deployable devices (such as air bag modules, pretensioners) may deploy alone or in various combinations depending on the impact event.

NOTE: Always refer to the appropriate workshop manual procedures prior to carrying out vehicle repairs affecting the supplemental restraint system (SRS) and safety belt system.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

All vehicles

1. **NOTE:** Refer to the correct removal and installation procedure for all SRS components being installed.

   When any deployable device or combination of devices are deployed and/or the restraints control module (RCM) has the diagnostic trouble code (DTC) B1231 (Crash Data Memory Full) in memory, the repair of the vehicle's SRS is to include the removal of all deployed devices and the installation of new deployable devices, the removal and installation of new impact sensors, and the removal and installation of a new RCM. DTCs must cleared from all required modules after repairs are carried out.

Vehicles with occupant classification sensor (OCS) system

2. **NOTE:** After installation of new occupant classification sensor (OCS) components carry out the OCS System Reset procedure as instructed in the workshop manual. Refer to the appropriate workshop manual (WSM) for OCS system removal and installation procedure.

   When a vehicle has been involved in a collision and the occupant classification sensor (OCS) module has DTC B1231 stored in memory, the repair of the OCS system is to include the following procedures for the specified system:
   - For rail type OCS system, inspect the passenger side floorpan for damage and repair as necessary. Install new OCS rails.
   - For weight sensor bolt type OCS system, inspect the passenger side floorpan for damage and repair as necessary. Install a new seat track with OCS weight sensor bolts.
   - **NOTE:** Most bladder type OCS modules do not store a DTC B1231 in memory after deployment. The DTC B1231 is stored only by the RCM.

     For bladder type OCS system, inspect for damage and repair as necessary. If installation of an OCS component is required, an OCS service kit must be installed.

All vehicles

3. When any damage to the impact sensor mounting points or mounting hardware has occurred, repair or install new mounting points and mounting hardware as needed.

4. When the driver air bag module has deployed, a new clockspring must be installed.

5. New driver and/or front passenger safety belt systems (including retractors, buckles and height adjusters) must be installed if the vehicle is involved in a collision that results in deployment of the driver and/or front passenger safety belt pretensioners. For additional information, refer to Section 501-20A .

6. Inspect the entire vehicle for damage, including the following components:
    - Steering column (deployable column if equipped)
    - Instrument panel knee bolsters and mounting points
    - Instrument panel braces and brackets
    - Instrument panel and mounting points
    - Seats and seat mounting points
    - Safety belts, safety belt buckles and safety belt retractors. For additional information, refer to Section 501-20A
    - SRS wiring, wiring harnesses and connectors

7. After carrying out the review and inspection of the entire vehicle for damage, repair or install new components as needed.

Pyrotechnic Device Disposal

Printable View (346 KB)

Disposal of Deployable Devices and Pyrotechnic Devices That Are Undeployed/Inoperative

NOTE: All inoperative air bag modules and safety belt pretensioners have been placed on the Mandatory Return List. All discolored or damaged air bag modules must be treated the same as any inoperative live air bag being returned.

1. Depower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. Remove the undeployed/inoperative device. For additional information, refer to the appropriate procedure in this section or Section 501-20A .

3. **NOTE:** When installing a new air bag module, a prepaid return postcard is provided with the replacement air bag module. The serial number for the new part and the vehicle identification number (VIN) must be recorded and sent to Ford Motor Company.

   If installing a new air bag module record the necessary information and return the inoperative air bag module to Ford Motor Company.

Disposal of Deployable Devices and Pyrotechnic Devices That Are Deployed

1. Depower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. Remove the deployed device. For additional information, refer to the appropriate procedure in this section or Section 501-20A .

3. **NOTE:** If a dual stage driver or passenger air bag module has deployed due to a crash event, the air bag module requires manual deployment to make sure both stages have deployed before scrapping the vehicle or disposing of the air bag module. To determine if a vehicle is equipped with dual stage driver or passenger air bag modules, refer to the Description and Operation portion of this section.

   Dispose of the deployed device in the same manner as any other part to be scrapped.

Disposal of Deployable Devices and Pyrotechnic Devices That Require Manual Deployment

1. Safety and environmental concerns require consideration and treatment of restraints system deployable and pyrotechnic devices when disposing of vehicles, deployable devices or pyrotechnic devices. Deploying deployable and pyrotechnic devices before scrapping a vehicle or the device eliminates the potential for hazardous exposures or reactions during processing. If special handling procedures are followed, deployable and pyrotechnic devices can be deployed safely and recycled with the vehicle, shipped separately to a recycling facility or disposed of safely.

   NOTE: To determine the deployable devices a vehicle is equipped with, refer to the Description

and Operation portion of this section.

A vehicle equipped with any of the following deployable devices requires manual deployment of the devices before scrapping the vehicle or component. For additional information, refer to the appropriate portion of this procedure.

- Driver air bag module
- Passenger air bag module
- Seat side air bag modules
- Safety canopy modules
- Side air curtain modules

2. **NOTE:** To determine the pyrotechnic devices a vehicle is equipped with, refer to the Description and Operation portion of this section.

   A vehicle equipped with any of the following pyrotechnic devices requires manual deployment of the devices before scrapping the vehicle or component. For additional information, refer to the appropriate portion of this procedure.
   - Safety belt buckle pretensioners
   - Safety belt retractor pretensioners
   - Adaptive load limiting retractors
   - Deployable steering column

3. **NOTE:** To determine if a vehicle is equipped with dual stage driver or passenger air bag modules, refer to the Description and Operation portion of this section.

   If a dual stage driver or passenger air bag module has deployed due to a crash event, the air bag module requires manual deployment to make sure both stages have deployed before scrapping the vehicle or disposing of the air bag module. For additional information, refer to Driver Air Bag Module, Passenger Air Bag Module and Seat Side Air Bag Modules — Remote Deployment in this procedure.

Driver Air Bag Module, Passenger Air Bag Module and Seat Side Air Bag Modules — Remote Deployment

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Do not set a live air bag module down with the trim cover face down. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Carry a live seat side air bag module with the air bag and tear seam pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Deployment is to be carried out outdoors with all personnel at least 9.14 meters

(30 feet) away to make sure of personal safety. Due to the loud report which occurs when the air bag is deployed, hearing protection is required.

WARNING: After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

NOTE: For air bag modules with multiple squibs, all the squibs on the air bag module must be deployed.

NOTE: Some driver and passenger front air bags have 2 deployment stages. After a crash event it is possible that Stage 1 has deployed and Stage 2 has not.

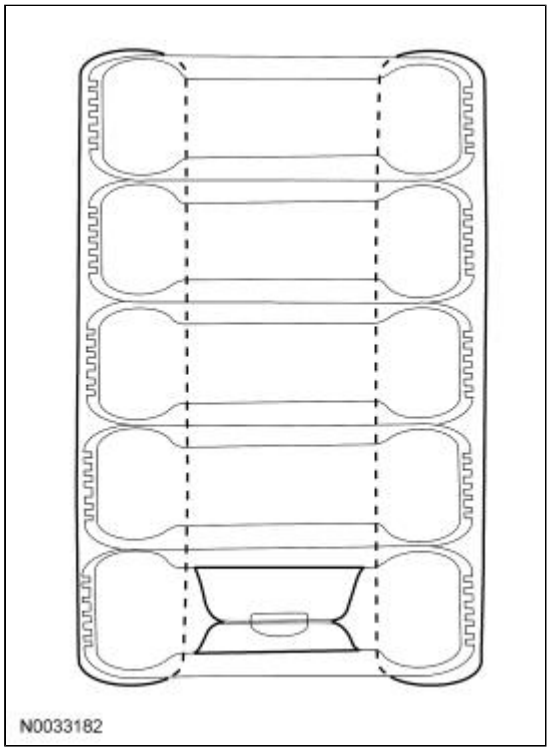
If a front air bag module has deployed, it is **mandatory** that the front air bag module be remotely deployed using the appropriate air bag disposal procedure.

NOTE: A typical air bag disposal is shown that is similar for all vehicles.

All driver, passenger and seat side air bag modules

1. Make a container to house the air bag module for deployment.
    - **NOTE:** The tires must be of sufficient size to accommodate the air bag module.

      Obtain a tire and wheel assembly and an additional 4 tires (without wheels) of the same size.
    - With the tire and wheel assembly on the bottom, stack the tires.
    - Securely tie all of the tires together.



2. Depower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

3. Remove the air bag module. For additional information, refer to the appropriate procedure in this section.

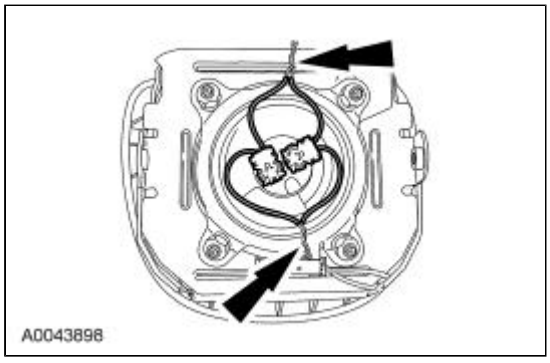
4. **NOTE:** If the air bag module does not have a hard-wired pigtail, it will be necessary to cut the wires and connector(s) from the vehicle wire harness and reconnect to the air bag module.

   Cut each of the air bag module wires near the electrical connector that connects to the vehicle wire harness.

5. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.

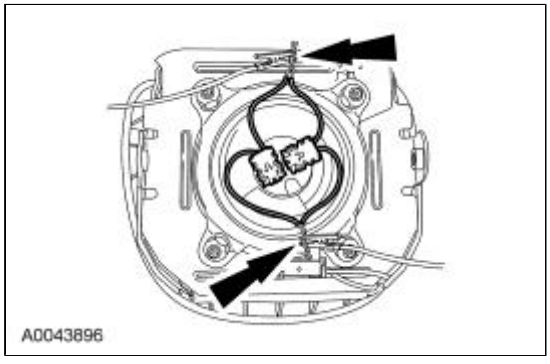
6. **NOTE:** Typical driver air bag module with 2 squibs shown, other air bag modules with multiple squibs similar.

   For air bag modules with multiple squibs, twist together a wire from each squib then repeat for the remaining wires from each squib.



7. Make a jumper harness to deploy the air bag module.
   - Obtain 2 wires (20 gauge minimum) at least 9.14 meters (30 feet) long and strip both ends of each wire.
   - At one end of the jumper harness, connect the wires together.

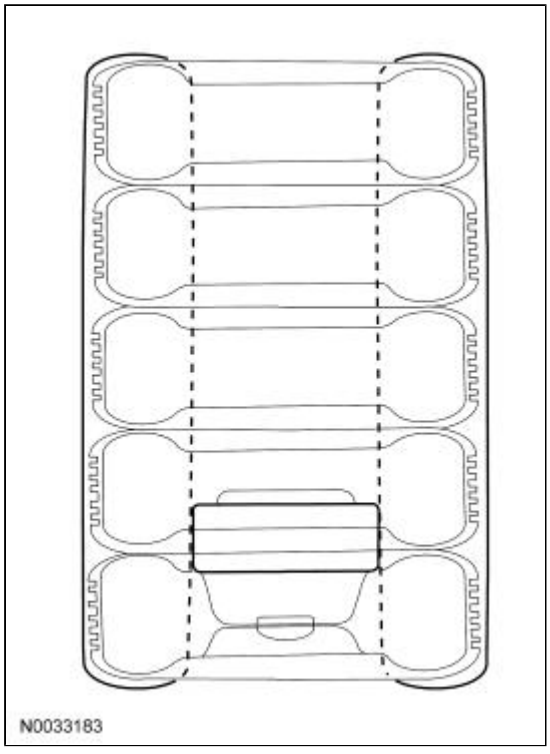
8. Using the end of the jumper harness that the wires are not connected together, attach each wire of the jumper harness to each wire of the air bag module or to the twisted-together wires if multiple squibs. Use tape or other insulating material to make sure that the leads do not make contact with each other.



Driver air bag modules

9. **NOTE:** Make sure to maintain the connections to the air bag module.

   With the stack of tires upright and the wheel on the bottom, carefully place the driver air bag module, with the trim cover facing up, on the wheel.

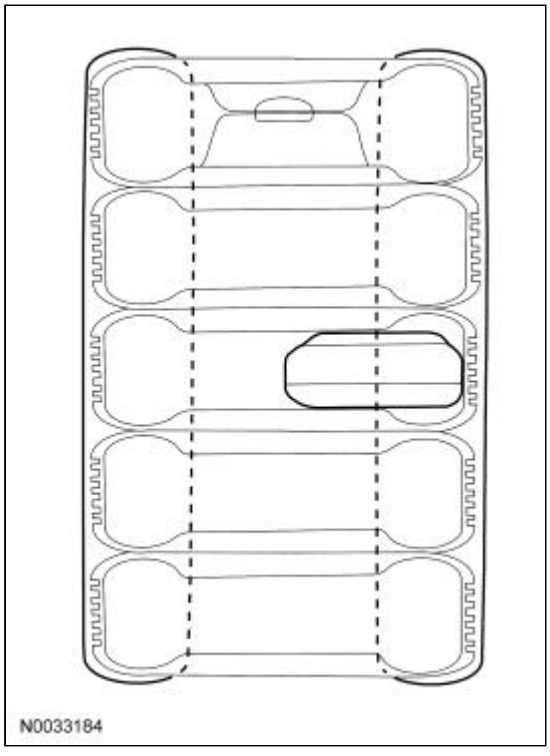


Passenger and seat side air bag modules

10. **NOTE:** Make sure to maintain the connections to the air bag module.

    Tip the stack of tires on its side and place the air bag module inside the center tire, making sure that there are 2 tires beneath the tire containing the air bag module and 2 tires (including the tire and wheel assembly) above the tire containing the air bag module.

11. Place the tire stack upright, with the wheel on top.



All driver, passenger and seat side air bag modules

12. Remain at least 9.14 meters (30 feet) away from the air bag module.

13. From the end of the jumper harness that is not connected to the air bag module, disconnect the 2 wires of the jumper harness from each other.

14. Deploy the air bag module by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.

15. To allow for cooling, wait at least 10 minutes before approaching the deployed air bag module.

16. Dispose of the deployed air bag module in the same manner as any other part to be scrapped.

Safety Belt Buckle Pretensioners, Safety Belt Retractor Pretensioners and Adaptive Load Limiting Safety Belt Retractors — Remote Deployment

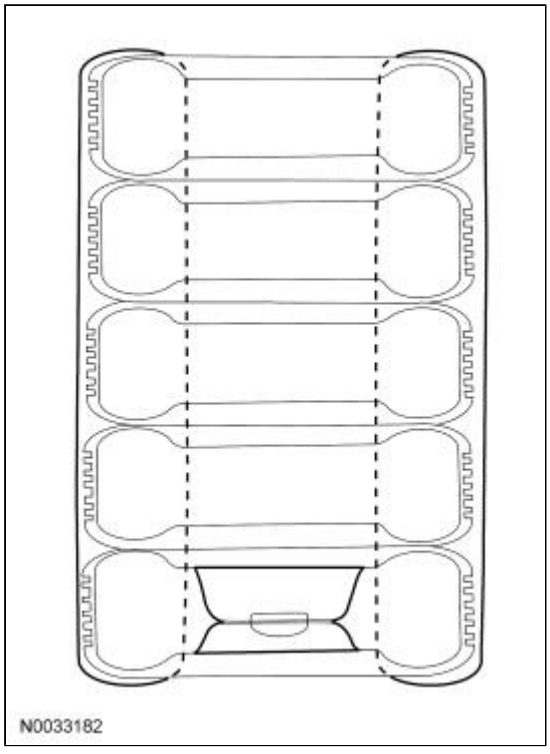
WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: Deployment is to be carried out outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when the pretensioner or adaptive load limiting retractor is deployed, hearing protection is required.

NOTE: A typical safety belt buckle and retractor disposal is shown that is similar for all vehicles.

1. Make a container to house the safety belt buckle or retractor for deployment.
    - **NOTE:** The tires must be of sufficient size to accommodate the safety belt buckle or retractor.

      Obtain a tire and wheel assembly and an additional 4 tires (without wheels) of the same size.
    - With the tire and wheel assembly on the bottom, stack the tires.
    - Securely tie all of the tires together.



2. Depower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

3. Remove the safety belt buckle or retractor. For additional information, refer to the appropriate procedure in Section 501-20A .
   - When deploying a safety belt buckle pretensioner, install a nut and bolt of sufficient length and of the same diameter as was used to retain it to the seat.

4. **NOTE:** If the safety belt buckle or retractor does not have a hard-wired pigtail, it will be necessary to cut the wires and connector(s) from the vehicle wire harness and reconnect to the safety belt buckle or retractor.

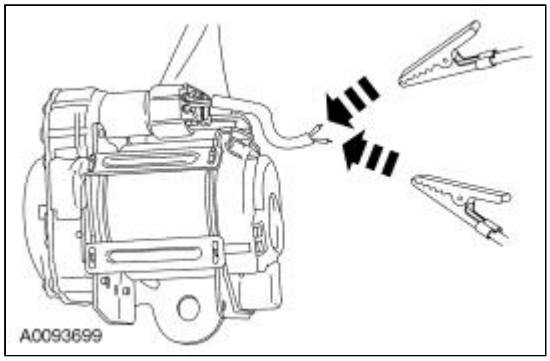
   Cut each of the safety belt buckle or retractor wires near the electrical connector that connects to the vehicle wire harness.

5. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.

6. Make a jumper harness to deploy the safety belt buckle or retractor.
   - Obtain 2 wires (20 gauge minimum) at least 9.14 meters (30 feet) long and strip both ends of each wire.
   - At one end of the jumper harness, connect the wires together.

7. **NOTE:** Typical safety belt retractor pretensioner shown, other safety belt buckle pretensioners and load limiting retractors similar.

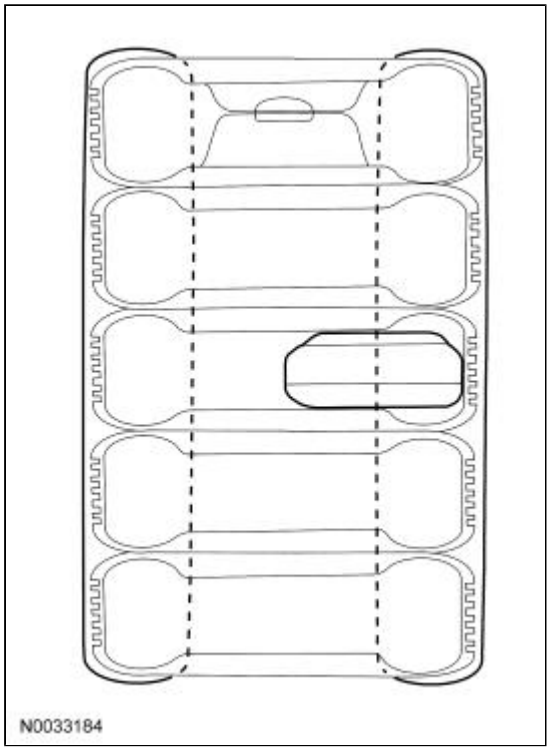
   Using the end of the jumper harness that the wires are not connected together, attach each wire of the jumper harness to each wire of the safety belt buckle or retractor. Use tape or other insulating material to make sure that the leads do not make contact with each other.



8. **NOTE:** Make sure to maintain the connections to the safety belt buckle or retractor.

   Tip the stack of tires on its side and place the safety belt buckle or retractor inside the center tire, making sure that there are 2 tires beneath the tire containing the safety belt buckle or retractor and 2 tires (including the tire and wheel assembly) above the tire containing the safety belt buckle or retractor.

9. Place the tire stack upright, with the wheel on top.



10. Remain at least 9.14 meters (30 feet) away from the safety belt buckle or retractor.

11. From the end of the jumper harness that is not connected to the safety belt buckle or retractor, disconnect the 2 wires of the jumper harness from each other.

12. Deploy the safety belt buckle or retractor by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.

13. To allow for cooling, wait at least 10 minutes before approaching the deployed safety belt buckle or retractor.

14. Dispose of the deployed safety belt buckle or retractor in the same manner as any other part to be scrapped.

Safety Belt Buckle Pretensioners, Safety Belt Retractor Pretensioners and Load Limiting Safety Belt Retractors — In-Vehicle Deployment

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: Deployment is to be carried out outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when the pretensioner or adaptive load limiting retractor is deployed, hearing protection is required.

NOTE: A typical safety belt buckle and retractor disposal is shown that is similar for all vehicles.

1. Depower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. Access the safety belt buckle or retractor electrical connectors. For additional information, refer to Section 501-20A .

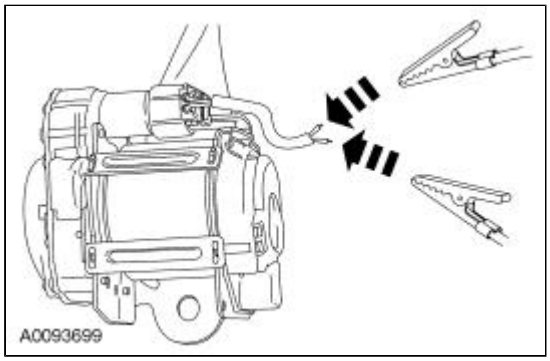
3. Cut each of the safety belt buckle or retractor wires, leaving at least 4 inches to work with.

4. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.

5. Make a jumper harness to deploy the safety belt buckle or retractor.
   - Obtain 2 wires (20 gauge minimum) at least 9.14 meters (30 feet) long and strip both ends of each wire.
   - At one end of the jumper harness, connect the wires together.

6. **NOTE:** Typical safety belt retractor pretensioner shown, other safety belt buckle pretensioners and load limiting retractors are similar.

   Using the end of the jumper harness that the wires are not connected together, attach each wire of the jumper harness to each wire of the safety belt buckle or retractor. Use tape or other insulating material to make sure that the leads do not make contact with each other.



7. Remain at least 9.14 meters (30 feet) away from the safety belt buckle or retractor.

8. From the end of the jumper harness that is not connected to the safety belt buckle or retractor, disconnect the 2 wires of the jumper harness from each other.

9. Deploy the safety belt buckle or retractor by touching the ends of the 2 wires of the jumper

harness to the terminals of a 12-volt battery.

10. To allow for cooling, wait at least 10 minutes before approaching the deployed safety belt buckle or retractor.

11. Dispose of the deployed safety belt buckle or retractor in the same manner as any other part to be scrapped.

Safety Canopy Modules and Side Air Curtain Modules — In-Vehicle Deployment

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

WARNING: Deployment is to be carried out outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when the safety canopy or side air curtain is deployed, hearing protection is required.

NOTE: The safety canopy module deployment for a scrapped vehicle will occur in its installed position in the vehicle.

NOTE: A typical safety canopy module disposal is shown that is similar for all vehicles.

1. Depower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

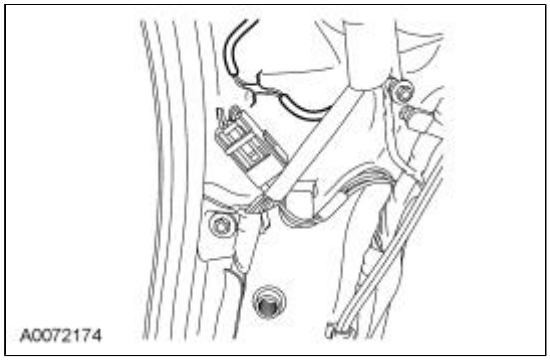
2. Access the safety canopy/side air curtain module electrical connectors. For additional information, refer to the appropriate procedure in this section.

3. Cut each of the safety canopy/side air curtain module wires leaving at least 4 inches to work with.

4. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.

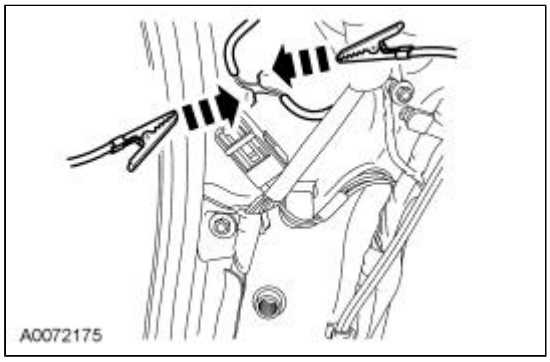
5. **NOTE:** Typical safety canopy/side air curtain module with 2 squibs shown, other safety canopy/side air curtain modules with 2 squibs are similar.

   For safety canopy/side air curtain modules with multiple squibs, twist together a wire from each squib then repeat for the remaining wires from each squib.



6. Make a jumper harness to deploy the safety canopy/side air curtain module.
    - Obtain 2 wires (20 gauge minimum) at least 9.14 meters (30 feet) long and strip both ends of each wire.
    - At one end of the jumper harness, connect the wires together.

7. Using the end of the jumper harness that the wires are not connected together, attach each wire of the jumper harness to each wire of the safety canopy/side air curtain module or to the twisted-together wires if multiple squibs. Use tape or other insulating material to make sure that the leads do not make contact with each other.



8. From the end of the jumper harness that is not connected to the safety canopy/side air curtain module, disconnect the 2 wires of the jumper harness from each other.

9. Deploy the safety canopy/side air curtain module by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.

10. To allow for cooling, wait at least 10 minutes before approaching the deployed safety canopy/side air curtain module.

11. Dispose of the deployed safety canopy/side air curtain module in the same manner as any other part to be scrapped.

Deployable Steering Column — In-Vehicle Deployment

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Deployment is to be carried out outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when the deployable steering column is deployed, hearing protection is required.

1. Depower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. **NOTE:** It may be necessary to lower or remove the deployable steering column from the instrument panel to access the deployable steering column electrical connector.

   Access the deployable steering column electrical connector.

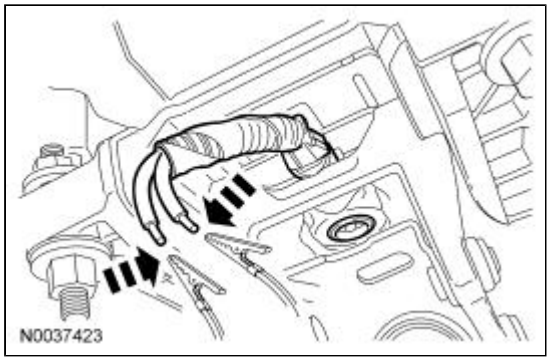
3. **NOTE:** If the deployable steering column does not have a hard-wired pigtail, it will be necessary to cut the wires and connector(s) from the vehicle wire harness and reconnect to the deployable steering column.

Cut each of the deployable steering column wires, leaving at least 4 inches to work with.

4. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.

5. Make a jumper harness to deploy the deployable steering column.
   - Obtain 2 wires (20 gauge minimum) at least 9.14 meters (30 feet) long and strip both ends of each wire.
   - At one end of the jumper harness, connect the wires together.

6. Using the end of the jumper harness that the wires are not connected together, attach each wire of the jumper harness to each wire of the deployable steering column. Use tape or other insulating material to make sure that the leads do not make contact with each other.



7. Remain at least 9.14 meters (30 feet) away from the deployable steering column.

8. From the end of the jumper harness that is not connected to the deployable steering column, disconnect the 2 wires of the jumper harness from each other.

9. Deploy the deployable steering column by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.

10. To allow for cooling, wait at least 10 minutes before approaching the deployed steering column.

11. Dispose of the deployed steering column in the same manner as any other part to be scrapped.

Rivet Nut Replacement

Printable View (112 KB)

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

CAUTION: If the safety canopy module has deployed, the tether cord rivet nut must be inspected and replaced if damaged before installing a new safety canopy.

NOTE: The air bag warning lamp illuminates when the RCM fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

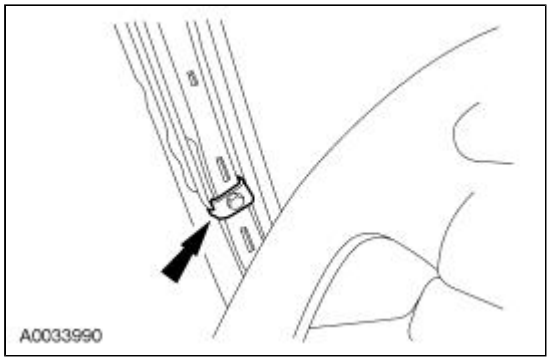
NOTE: A typical rivet nut replacement is shown that is similar for all vehicles.

NOTE: The left-hand drive driver side is shown, all others are similar.

1. Depower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.

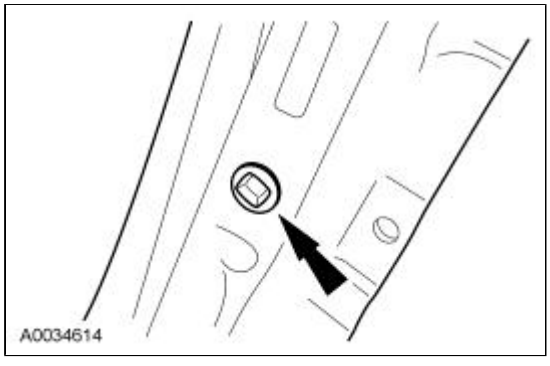
2. Remove the A-pillar trim panel. For additional information, refer to Section 501-05 .

3. Remove the bolt and bracket for the tether cord from the A-pillar.



4. Position and secure the side air curtain tether cord and bracket assembly out of the way.

5. Using the appropriate service tool, sand the rivet nut shoulder until the shoulder surface is removed.



6. Punch the remaining portion of the rivet nut through the rivet nut hole.

7. **NOTE:** Use only Ford Motor Company factory-authorized replacement parts for rivet nut repair procedure.

   Obtain the correct square shank rivet nut for the vehicle application from the Ford Master Parts Catalog, and insert it into the rivet nut hole.

8. Using a suitable rivet nut installing tool, install the rivet nut. For additional information, refer to the tool manufacturer's operating instructions.

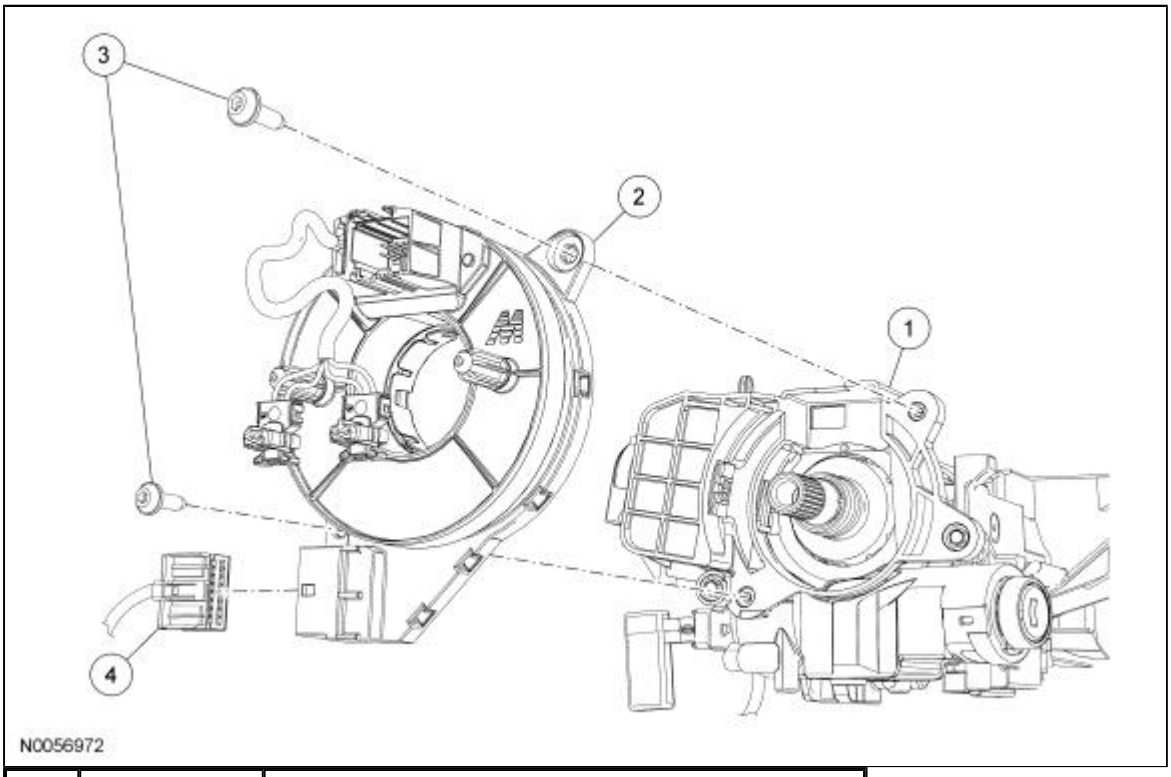
9. Position the A-pillar tether cord. Install the bolt. See the appropriate component removal and installation procedure or Specifications for the correct torque specification.

10. **NOTE:** The tether cord must be positioned correctly in place before installing the A-pillar trim panel.

    Install the A-pillar trim panel. For additional information, refer to Section 501-05.

Clockspring

Printable View (249 KB)



Item	Part Number	Description
1	3F791	Multi-function switch carrier
2	14A644	Clockspring
3	W506943	Clockspring screws (2 required)
4	—	Clockspring electrical connector (part of 14401)

Removal

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

1. Center the tilt steering column.

2. Depower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

3. Remove the driver air bag module. For additional information, refer to Driver Air Bag Module in this section.

4. **NOTE:** Make sure the road wheels are in the straight-ahead position.

   Remove the steering wheel. For additional information, refer to Section 211-04 .

5. Disconnect the clockspring electrical connector.

6. Remove the 2 screws and remove the clockspring.

Installation

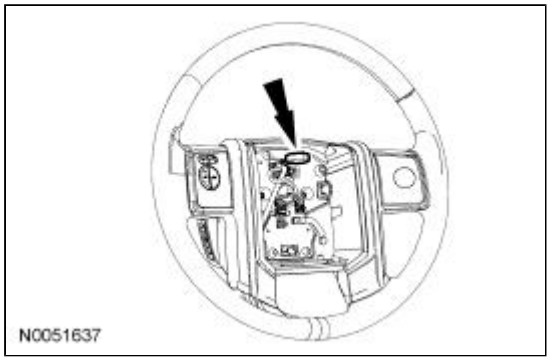
All vehicles

1. Install the clockspring and the 2 screws.

2. Connect the clockspring electrical connector.

Vehicles installing a new clockspring

3. Install the steering wheel. For additional information, refer to Section 211-04 .
   - After the steering wheel installation, remove the clockspring sealing key.



Vehicle repairs reusing the same clockspring

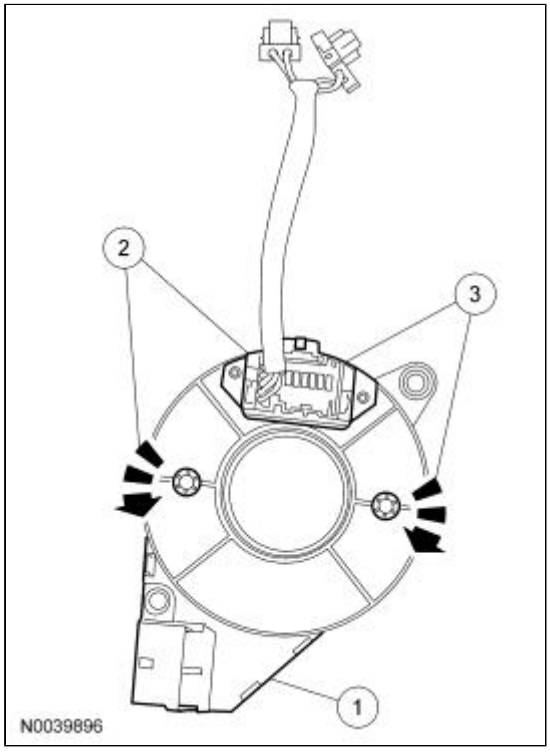
4. **WARNING: Incorrect centralization may result in premature component failure. If in doubt when centralizing the clockspring, repeat the centralizing procedure. Failure to follow this instruction may result in personal injury.**

   CAUTION: Make sure the road wheels are in the straight-ahead position.

   If the vehicle's clockspring has rotated out of center, follow these steps to center the clockspring.
   1. Hold the clockspring outer housing stationary.
   2. **CAUTION: Overturning will destroy the clockspring. The internal ribbon wire acts as the stop and can be broken from its internal connection.**

      While turning the rotor counterclockwise, carefully feel for the ribbon wire to run out of length and for a slight resistance. Stop turning at this point.
   3. Turn the clockspring clockwise (approximately 2 turns) until the clockspring rotor wiring and connector are in the 12 o'clock position. clockspring is now centered.

- Do not allow the rotor to turn from this position.



5. **CAUTION: If the vehicle is left unattended by the technician between centralizing the clockspring and installing the steering wheel, the centralizing procedure must be repeated.**

   Install the steering wheel. For additional information, refer to Section 211-04 .

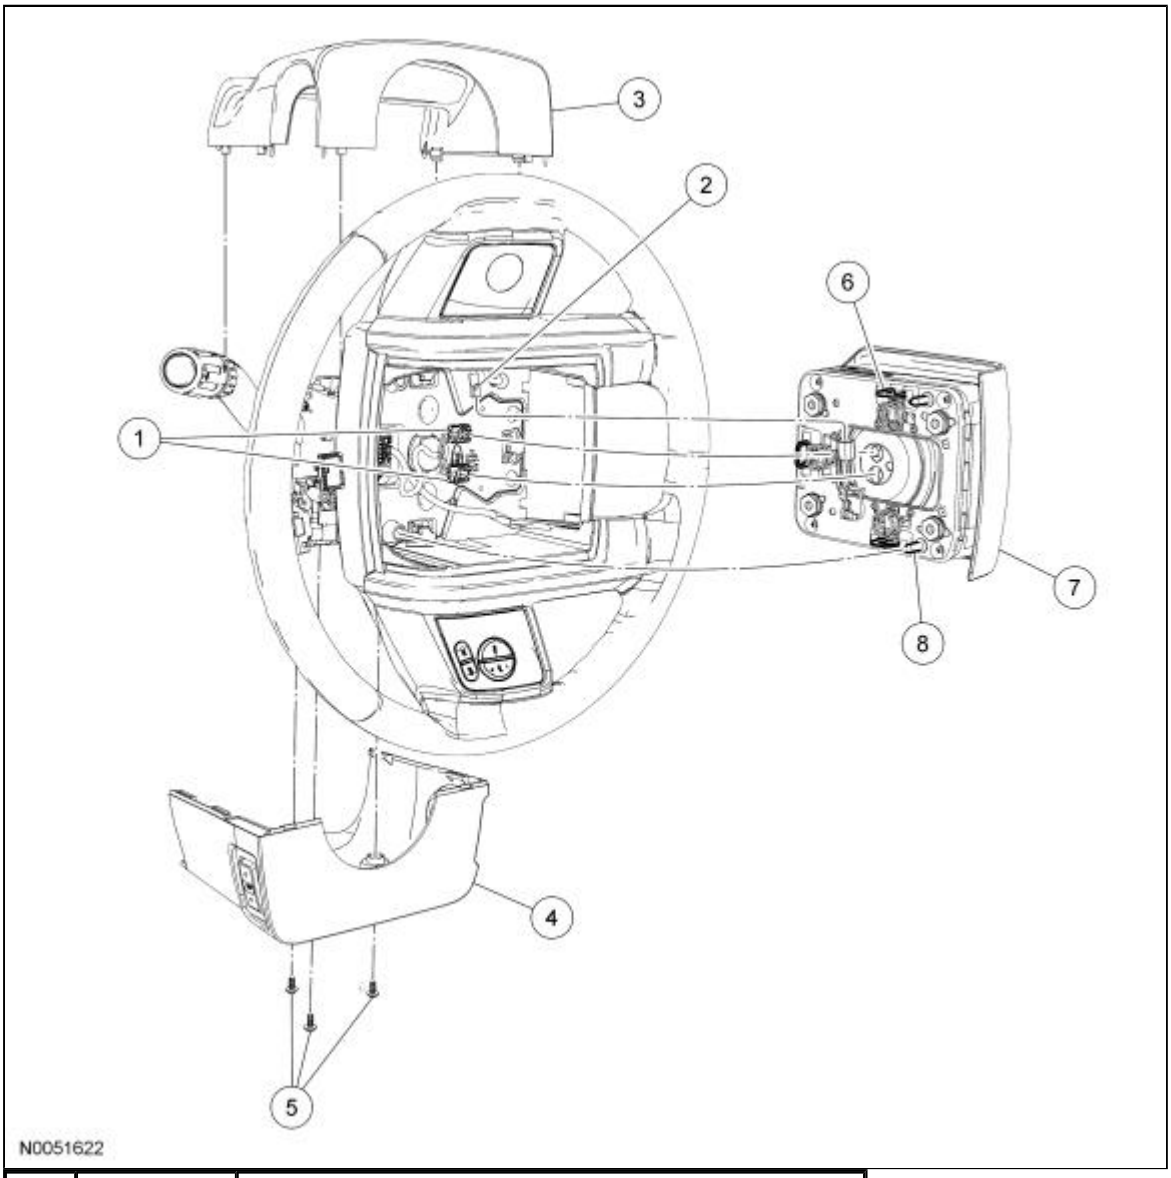
All vehicles

6. Install the driver air bag module. For additional information, refer to Driver Air Bag Module in this section.

7. Repower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

Driver Air Bag Module

Printable View (367 KB)



Item	Part Number	Description
1	—	Driver air bag module electrical connectors (part of 14A664) (2 required)
2	—	Horn switch electrical connector (part of 3600)
3	3530	Steering column upper shroud
4	3K512	Steering column lower shroud
5	W710485	Steering column lower shroud screws (3 required)
6	—	Driver air bag module wire clip (part of 043B13) (3 required)
7	043B13	Driver air bag module
8	—	Driver air bag module locator pin (2 required) (part

		of 043B13)

Removal and Installation

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Do not set a live air bag module down with the trim cover face down. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

CAUTION: Make sure each of the 3 driver air bag module wire clips are disengaged from each of the 3 steering wheel hooks before removing the driver air bag module from the steering wheel. Failure to do so will damage the driver air bag module and steering wheel.

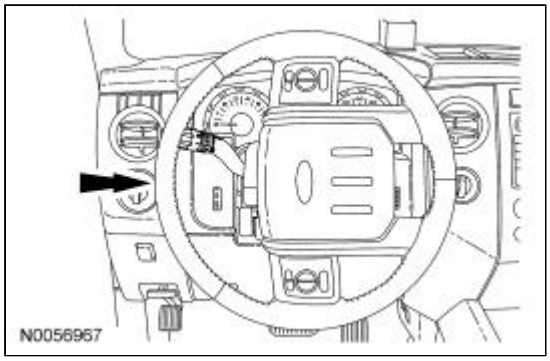
NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

All vehicles

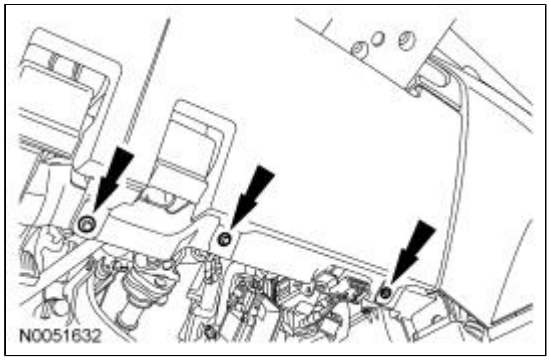
1. Make sure the road wheels are in the straight-ahead position.
2. Center the tilt steering column.
3. Turn the steering wheel so the top of the wheel is 90 degrees to the left (at the 9 o'clock position).



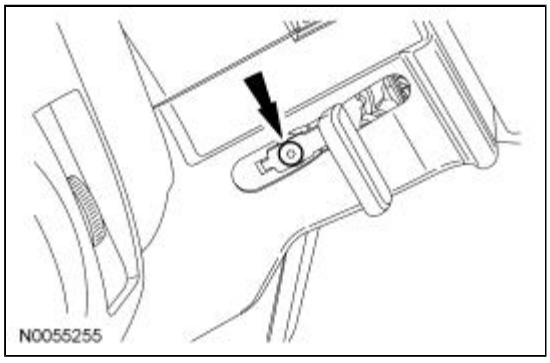
4. Depower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

Vehicles with manual tilt wheel

5. Remove the lower steering column opening cover.
   - Remove the 3 screws and pull out to release the top retaining clips and remove the lower steering column opening cover.



6. Remove the screw and steering column manual tilt lever.



All vehicles

7. Remove the 3 steering column lower shroud screws.

8. Release the clips and remove the steering column upper shroud.

9. Remove the steering column lower shroud.
   - If equipped, disconnect the power tilt steering column switch located on the lower shroud.

10. **CAUTION: Make sure each of the 3 driver air bag module wire clips are disengaged**

from each of the 3 steering wheel hooks before removing the driver air bag module from the steering wheel. Failure to do so will damage the driver air bag module and steering wheel.

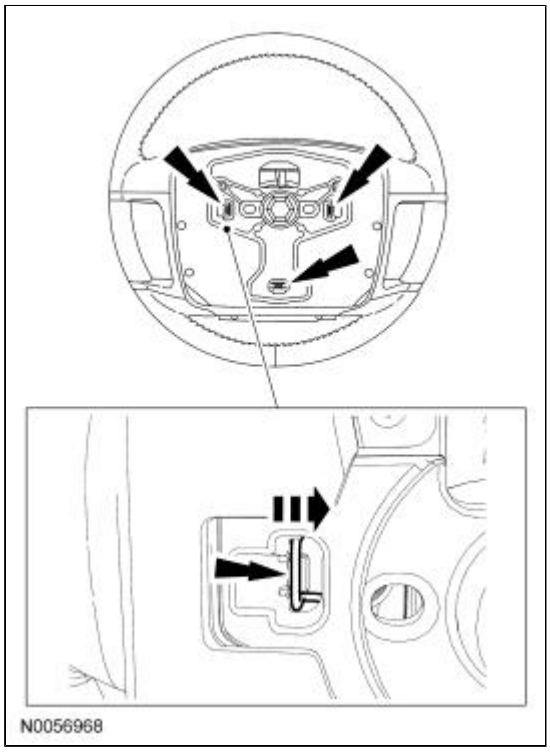
NOTE: Steering wheel is removed for clarity. The rear of the steering wheel is shown.

NOTE: Use a mirror to look at the rear of the steering wheel to locate where the 3 driver air bag module wire clips attach to the steering wheel hooks.

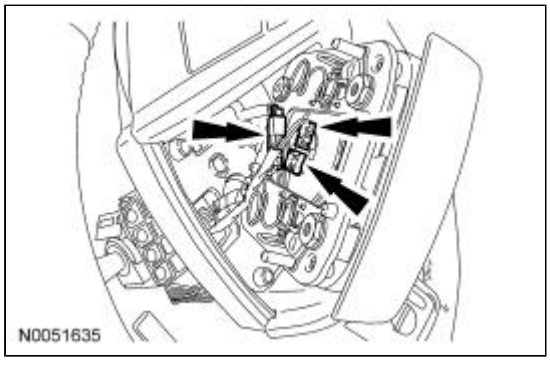
NOTE: Note the position of the 2 driver air bag module locator pins to the steering wheel for installation.

Using a screwdriver or a suitable tool, release each of the 3 driver air bag module wire clips from the steering wheel hooks.

- Access the 3 driver air bag module wire clips through the back of the steering wheel cover and push the wire clips toward the center of the steering wheel to release.



11. Disconnect the 2 driver air bag module electrical connectors, then disconnect the horn switch electrical connector and remove the driver air bag module.



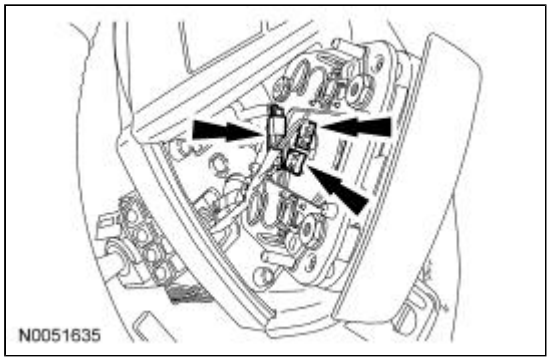
12. Turn the steering wheel so the top of the wheel is back in the straight ahead position (the 12 o'clock position).

Installation

All vehicles

1. **CAUTION: The clockspring electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module.**

   Connect the horn switch electrical connector, then connect the 2 driver air bag module electrical connectors.

2. Position the driver air bag module to the steering wheel lining up the locator pins.

3. **NOTE:** Make sure that all 3 driver air bag module wire clips are fully engaged and seated correctly to the steering wheel.

   NOTE: Audible clicks will be heard when the 3 driver air bag module wire clips are fully engaged.

   Firmly press the driver air bag module to the steering wheel, seating the 3 driver air bag module wire clips to the steering wheel hooks.
   - Check the driver air bag module trim cover to the steering wheel for an even gap clearance and correct movement.

4. Install the steering column lower shroud.
   - If equipped, connect the power tilt steering column switch.

5. Install the steering column upper shroud.

6. Install the 3 steering column lower shroud screws.

Vehicles with manual tilt wheel

7. Install the steering column manual tilt lever and screw.
   - Tighten to 6 Nm (53 lb-in).

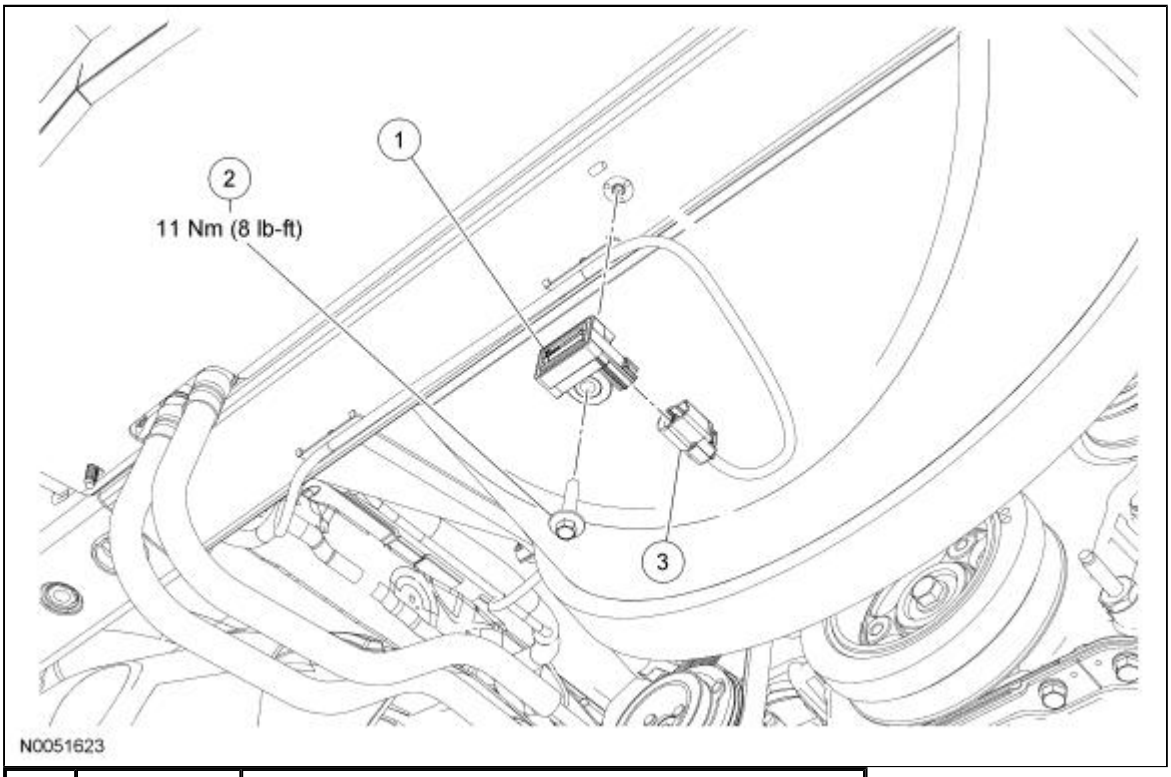
8. Install the lower steering column opening cover and the 3 screws.

All vehicles

9. Repower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

Front Impact Severity Sensor

Printable View (195 KB)



Item	Part Number	Description
1	14B004	Front impact severity sensor
2	W711619	Front impact severity sensor bolt
3	—	Front impact severity sensor electrical connector (part of 14290)

Removal and Installation

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag supplemental restraint system SRS is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. Install and correctly position the sensor or any other damaged SRS components whether or not the air bag is deployed.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

NOTE: The front impact severity sensor is located on the bottom of the lower radiator support.

1. Depower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. Disconnect the front impact severity sensor electrical connector.

3. **WARNING: The tightening torque of the air bag front impact severity sensor retaining bolt is critical for correct system operation.**

   NOTE: Make sure the radiator support and front impact severity sensor mating surfaces are clean and free of foreign material.

   NOTE: Note position of the locator tab on the front impact severity sensor for installation.

   Remove the bolt and front impact severity sensor.
   - To install, tighten to 11 Nm (8 lb-ft).

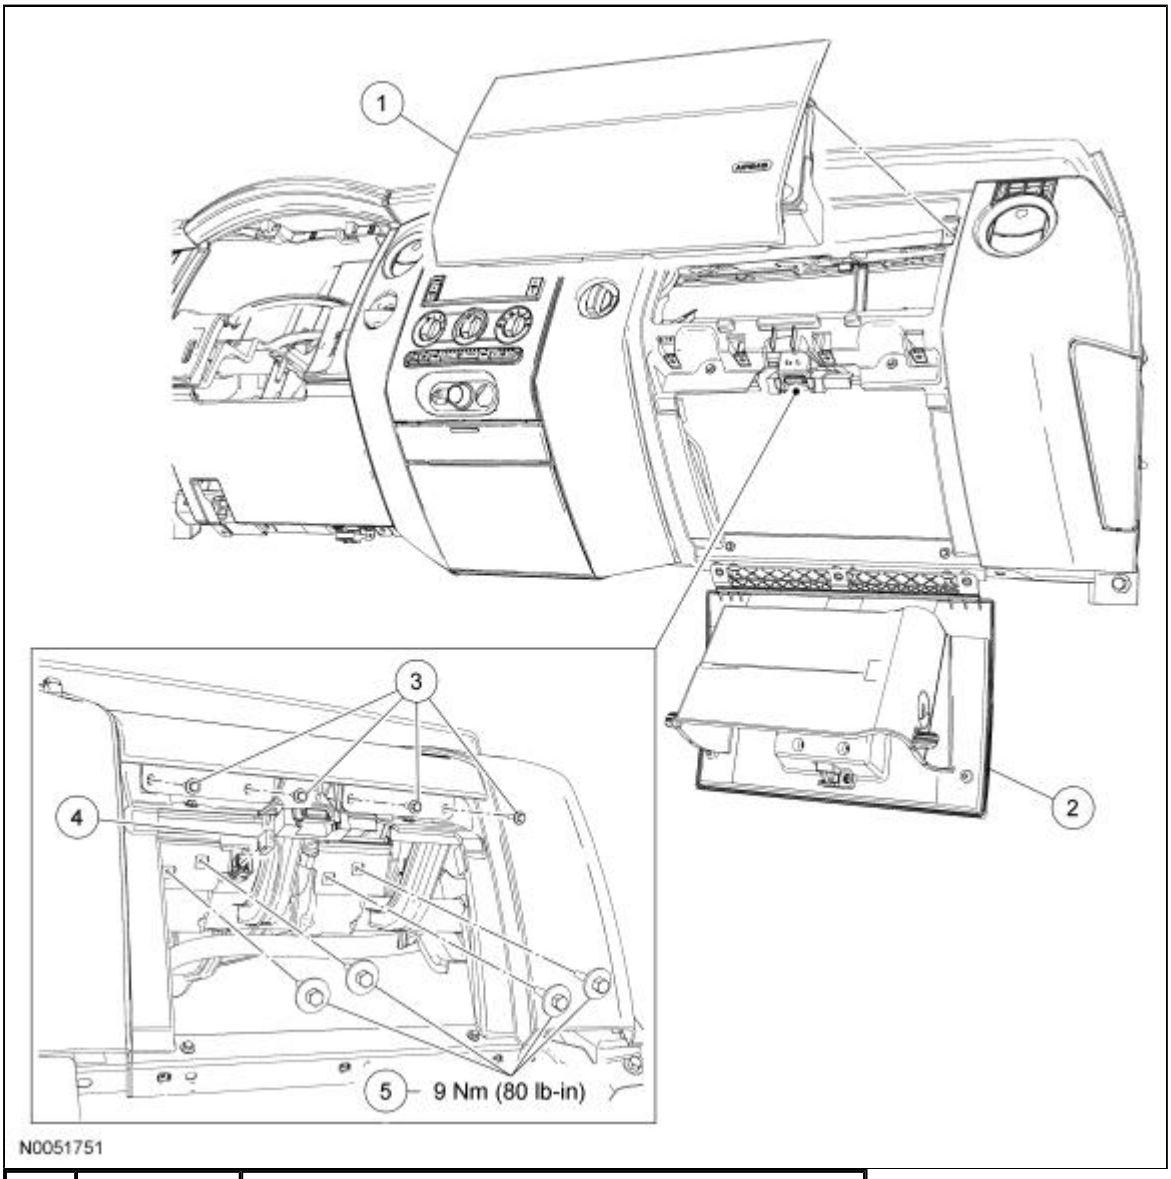
4. To install, reverse the removal procedure.

5. Repower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

Passenger Air Bag Module

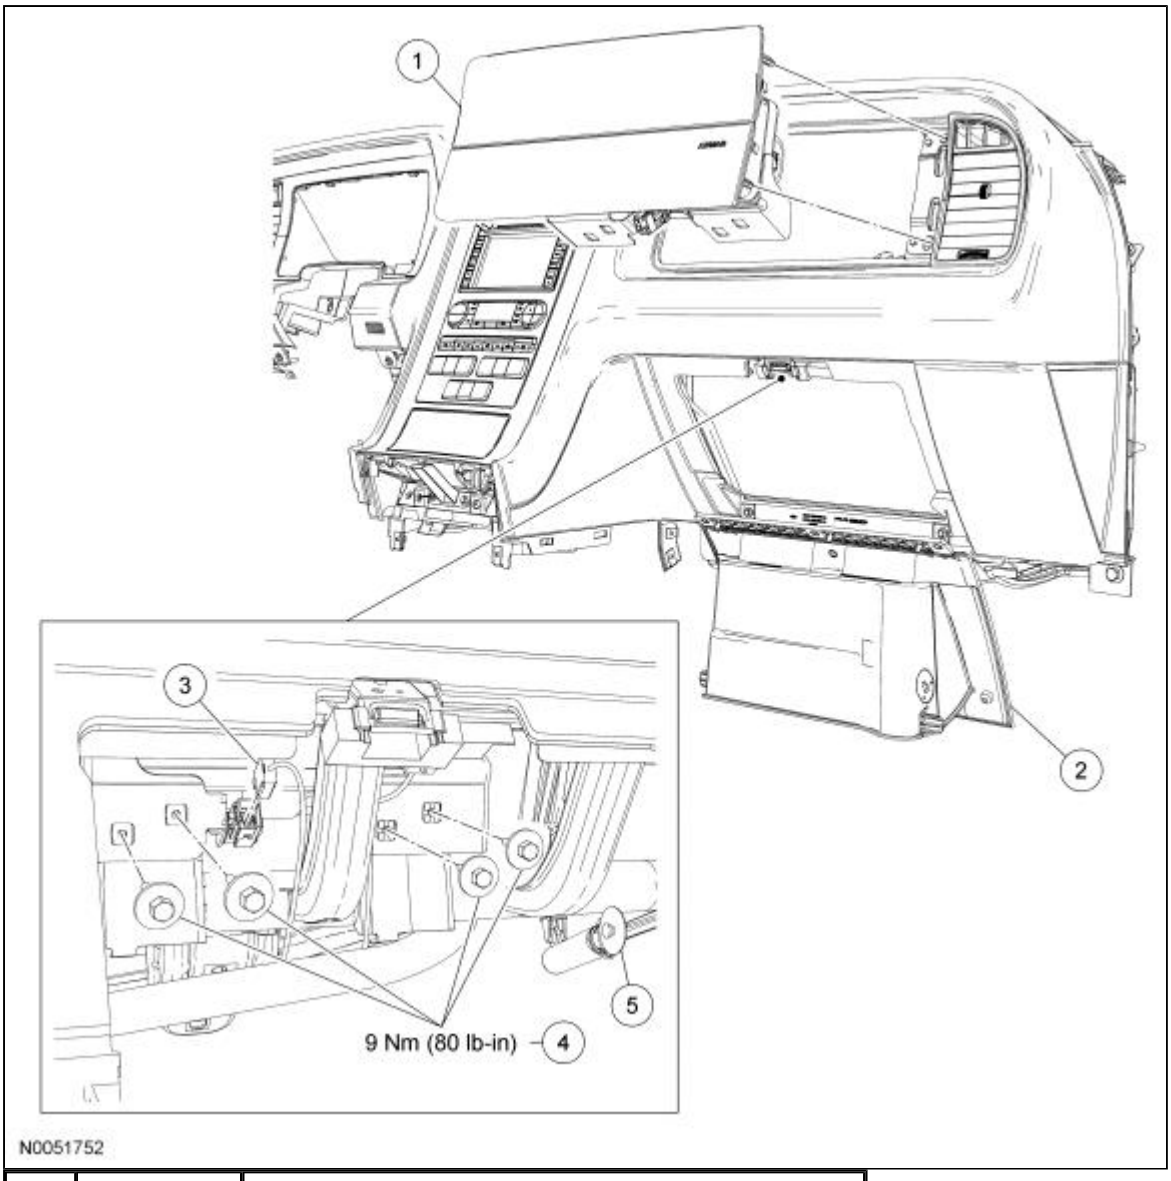
Printable View (404 KB)

Expedition Passenger Air Bag



Item	Part Number	Description
1	044A74	Passenger air bag module
2	—	Glove compartment door
3	W707628	Passenger air bag module deployment door screws (4 required)
4	—	Passenger air bag module electrical connector (part of 14401)
5	W709027	Passenger air bag module bolts (4 required)

Navigator Passenger Air Bag



Item	Part Number	Description
1	044A74	Passenger air bag module
2	—	Glove compartment door
3	—	Passenger air bag module electrical connector (part of 14401)
4	W709027	Passenger air bag module bolts (4 required)
5	—	Glove box door dampener (if equipped)

Removal and Installation

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Carry a live air bag module with the air bag and deployment door pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Do not set a live air bag module down with the deployment door face down. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: Air bag modules with discolored or damaged deployment doors must be replaced, not repainted.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

All vehicles

1. Depower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. Open and lower the glove compartment door.
   - If equipped, disconnect the glove compartment door dampener.

3. Disconnect the passenger air bag module electrical connector.

Expedition vehicles

4. Remove the 4 passenger air bag module deployment door screws.

All vehicles

5. Remove the 4 passenger air bag module bolts.
   - To install, tighten to 9 Nm (80 lb-in).

6. **CAUTION: Do not handle the passenger air bag module by grabbing the edges of the deployment door.**

   Reaching one hand into the glove box opening, push out on the bottom of the passenger air bag module deployment door releasing the bottom clips. Then remove the passenger air bag module from the instrument panel.

7. **NOTE:** During passenger air bag module installation, make sure all the deployment door clips are fully seated into the instrument panel.

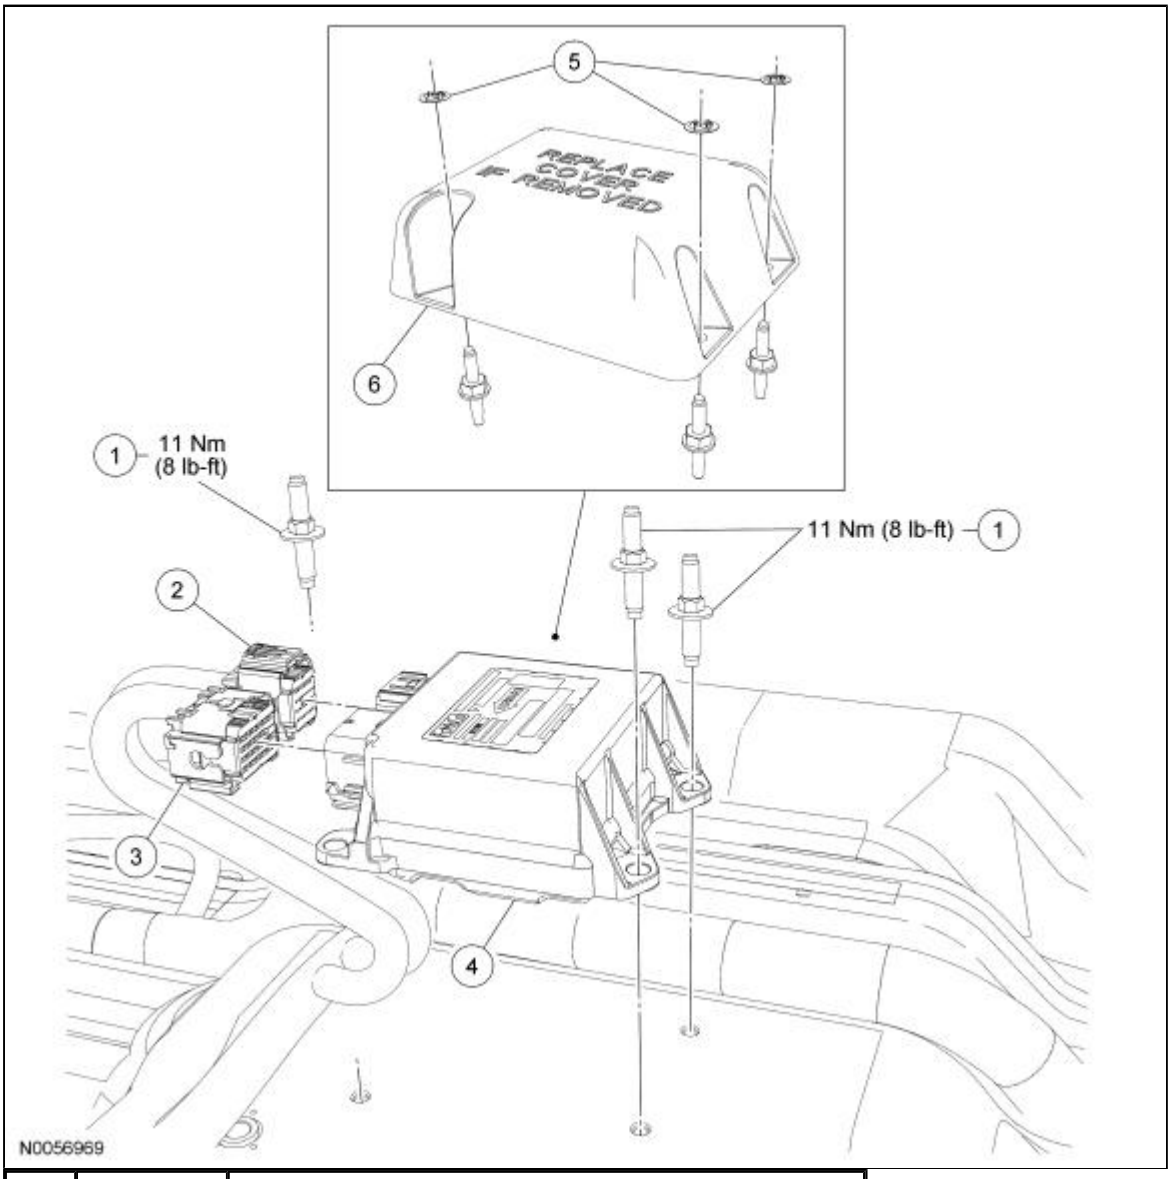
   To install, reverse the removal procedure.

8. Repower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

Restraints Control Module (RCM)

Printable View (365 KB)

NOTE: Seats removed for clarity.



Item	Part Number	Description
1	W710898	Restraints control module (RCM) bolts (3 required)
2	—	Small RCM electrical connector (part of 14A005)
3	—	Large RCM electrical connector (part of 14A005)
4	14B321	RCM
5	W623482	RCM cover push-nut retainers (3 required) (vehicles with bucket seats and no center console only)
6	14A099	RCM cover (vehicles with bucket seats and no center console only)

Removal

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.

WARNING: The RCM orientation is critical for proper air bag SRS operation. If a vehicle equipped with an SRS system has been involved in a collision in which the center tunnel area has been damaged, inspect the mounting and bracket for deformation. If damaged, a new RCM must be installed whether or not the air bags have deployed. In addition, make sure the area of the RCM mounting is restored to its original condition.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage can result.

CAUTION: When installing a new RCM, it is necessary to carry out programmable module installation (PMI). For additional information, refer to Section 418-01 .

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: When installing a new RCM, always make sure the correct RCM is being installed. If an incorrect RCM is installed, erroneous DTCs will result.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

All vehicles

1. If installing a new restraints control module (RCM), carry out the steps necessary to prepare for programmable module installation (PMI). For additional information, refer to Section 418-01 .

2. Depower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

Vehicles with a center console

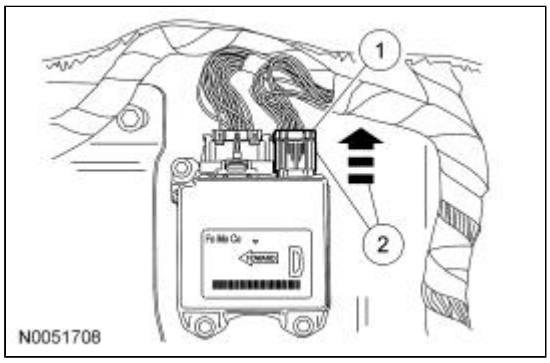
3. Remove the center console. For additional information, refer to Section 501-12 .

Vehicles with bucket seats and no center console

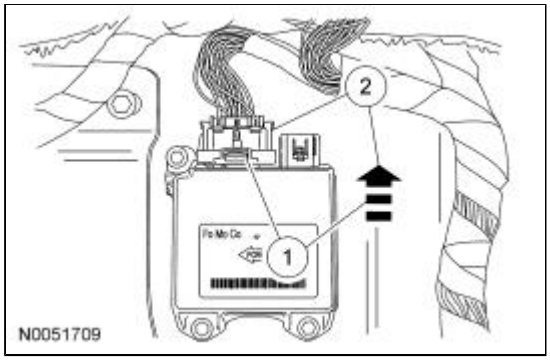
4. Remove the 3 RCM push-nut retainers and the RCM cover.

All vehicles

5. Disconnect the small RCM electrical connector.
    1. Push down to release the retaining tab.
    2. While releasing the retaining tab, pull out and disconnect the small RCM electrical connector.



6. Disconnect the large RCM electrical connector.
    1. Pinch the thumb tab and pivot the connector position assurance lever away from the RCM, disengaging the lever.
    2. Pull out and disconnect the large RCM electrical connector.



7. Remove the 3 bolts and RCM.

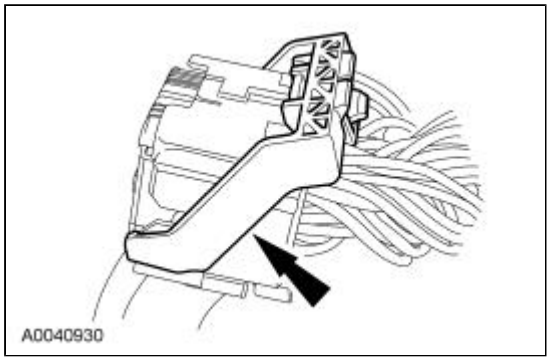
Installation

All vehicles

1. **WARNING: The tightening torque of the air bag RCM retaining bolts is critical for correct system operation.**

   Install the RCM and 3 bolts.
   - Tighten to 11 Nm (8 lb-ft).

2. Make sure the connector position assurance lever is in the full release position before attempting to connect the connector.

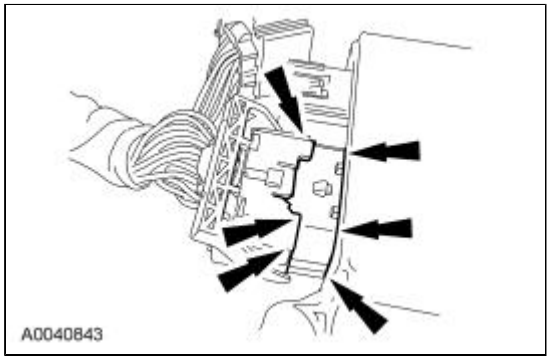


3. **CAUTION: Putting the large RCM electrical connector into the RCM on an angle can cause bad electrical connections and damage components.**

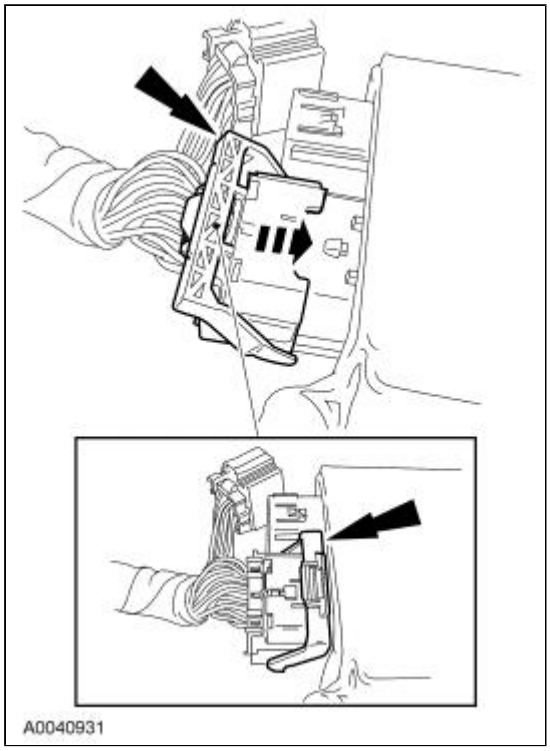
   Position the large RCM electrical connector into the RCM.

   - **CAUTION: Do not push the connector on to where the lever pivots and seats itself. Light pressure is needed to get the connector into position on the RCM before using the lever to fully seat the connector.**

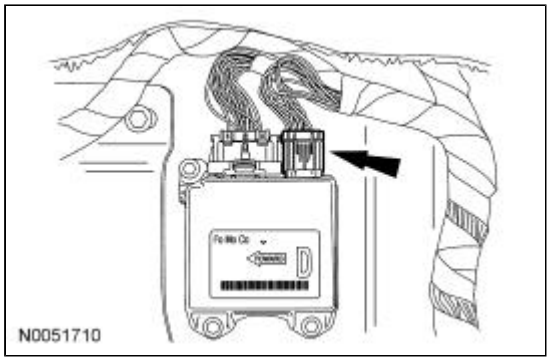
     With the large RCM electrical connector uniformly aligned to the RCM, lightly push in until a subtle audible click is heard and slight resistance is felt.



4. Connect the RCM electrical connector.
   - Pivot the connector position assurance lever toward the RCM, drawing the connector in to the RCM.
     - Make sure the thumb tab is engaged to the retainer on the RCM and locked in place.



5. Connect the small RCM electrical connector.



Vehicles with bucket seats and no center console

6. Install the 3 RCM push-nut retainers and the RCM cover.

Vehicles with a center console

7. Install the center console. For additional information, refer to Section 501-12 .

All vehicles

8. Repower the SRS. **Do not prove out the SRS at this time.** For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

9. When installing a new RCM, carry out the steps necessary to complete programmable module installation (PMI). For additional information, refer to Section 418-01 .

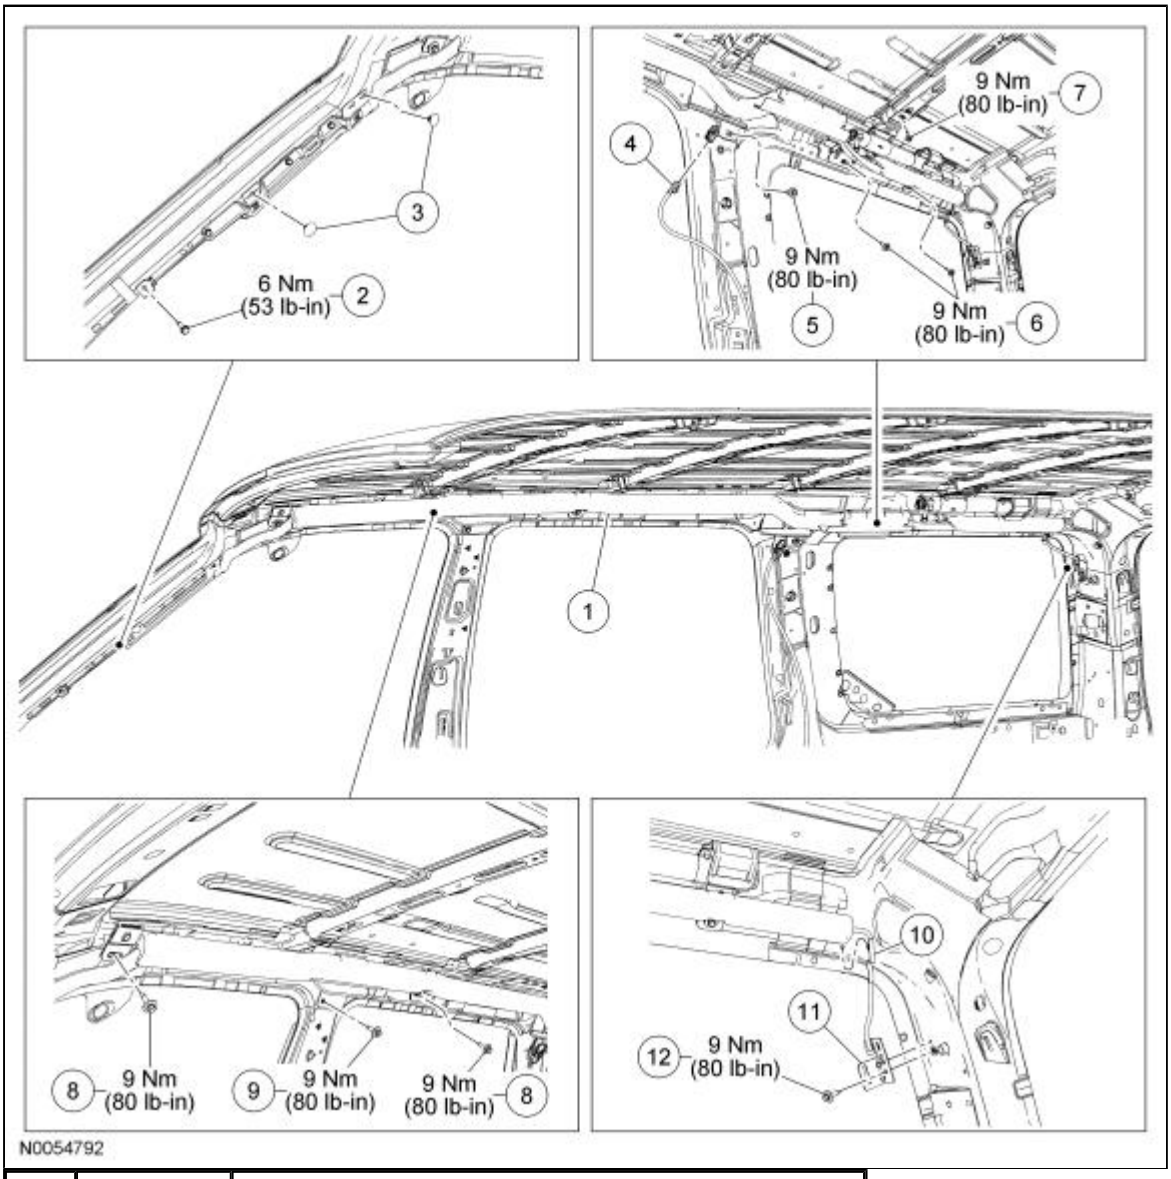
10. Prove out the supplemental restraint system (SRS) as follows:
Turn the ignition switch from ON to OFF. Wait 10 seconds, then turn the ignition switch back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn OFF. If an

air bag SRS fault is present, the air bag warning indicator will:
— fail to light.
— remain lit continuously.
— flash.
The air bag warning indicator might not light until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.
Clear all continuous memory diagnostic trouble codes (DTCs) from the RCM.

Safety Canopy Module

Printable View (434 KB)

NOTE: Expedition shown, Navigator, Expedition EL and Navigator L similar.



Item	Part Number	Description
1	042D94	Safety canopy module
2	—	Front tether cord bracket bolt (part of 042D94)
3	—	Front tether cord pin-type retainers (2 required) (part of 042D94)
4	—	Safety canopy module electrical connector (part of 14A005)
5	W706681	Safety canopy module C-pillar bolt
6	W706681	Safety canopy module rear bolts (2 required)

7	W706681	Safety canopy module roof bracket bolt
8	W706681	Safety canopy module front bolts (2 required)
9	W706681	Safety canopy module B-pillar bracket bolt
10	—	Safety canopy module rear tether cord routing clip pin-type retainer (part of 042D94)
11	—	Safety canopy module rear tether cord anchor bracket (part of 042D94)
12	W706681	Safety canopy module rear tether cord anchor bracket bolt

Removal

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: To reduce the risk of personal injury from an accidental deployment, always carry or place a live safety canopy module with the safety canopy and tear seam pointed away from your body. Failure to do so can result in personal injury in the event of a safety canopy module deployment.

WARNING: After deployment, the surface of the safety canopy can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

WARNING: Never probe the connector on the safety canopy module. Doing so can result in safety canopy deployment which can result in personal injury.

WARNING: Anytime the safety canopy has deployed, the headliner, and all A, B, C, and D-pillar upper trim panels and attaching hardware must be replaced along with any other damaged components and hardware. Failure to do so can result in personal injury in the event of a safety canopy deployment.

WARNING: Vehicles equipped with safety canopy modules require a specific headliner. When installing a new headliner on a vehicle equipped with safety canopy modules, make sure a headliner for safety canopy modules is being used. The word AIRBAG will appear on the headliner where it meets each B-pillar trim panel. Failure to do so can result in personal injury in the event of a safety canopy module deployment.

WARNING: Before installing the safety canopy module, inspect the roofline for any damage. If necessary, the sheet metal must be reworked to its original condition and structural integrity. All damaged fasteners must be replaced and any foreign objects removed. Failure to do so may result in personal injury in the event of a safety canopy deployment.

WARNING: Inspect the safety canopy before installation. If the safety canopy is damaged or the cover has separated or safety canopy material has been exposed, a new safety canopy module must be installed. Do not attempt to repair the safety canopy module. Failure to follow these instructions can result in personal injury in the event of a safety canopy module deployment.

WARNING: To reduce the risk of injury, do not obstruct or place objects in the deployment path of the safety canopy module. Failure to follow these instructions can result in personal injury in the event of a safety canopy module deployment.

WARNING: Never put any type of fastener or tie strap around any part of the safety canopy module or interior trim panel. This will prevent the safety canopy module from deploying correctly. Failure to do so can result in personal injury in the event of a safety canopy module deployment.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and perform the diagnostic procedure again.

NOTE: The passenger side safety canopy module is shown, driver side similar.

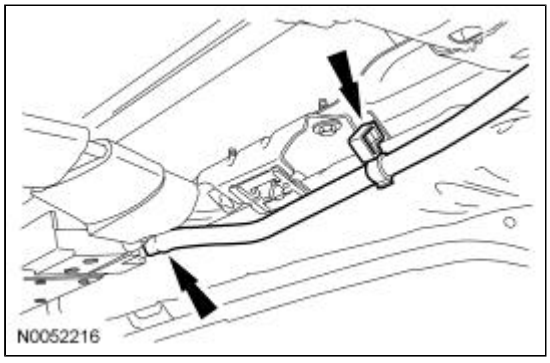
All vehicles

1. Depower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. Remove the headliner. For additional information, refer to Section 501-05 .

Vehicles with a moon roof

3. Disconnect the moon roof rear drain hose and release the drain hose retainer from the coat hook bracket.



All vehicles

4. Disconnect the safety canopy module electrical connector.

5. **NOTE:** Note the locator tab on the front tether anchor bracket to the A-pillar sheetmetal for installation.

   Remove the front tether cord bolt and bracket from the A-pillar.

6. Remove the 2 front tether cord pin-type retainers from the A-pillar sheetmetal.

7. Remove the 2 safety canopy module front bolts and the one B-pillar bracket bolt.

Expedition/Navigator vehicles

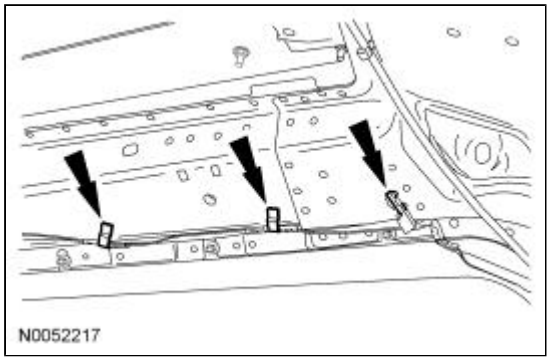
8. Detach the safety canopy module rear tether cord routing clip pin-type retainer from the sheetmetal.

9. **NOTE:** Note the locator tab on the rear tether cord anchor bracket to the D-pillar sheetmetal for installation.

   Remove the bolt and the safety canopy module rear tether cord anchor bracket from the D-pillar.

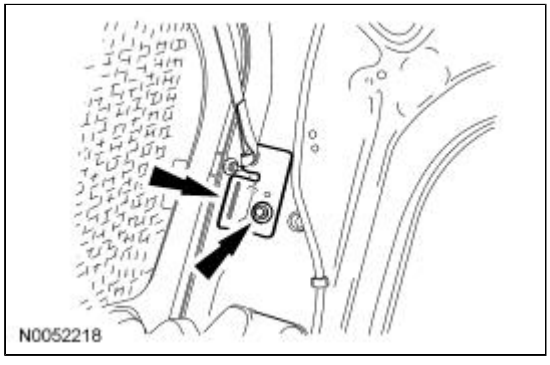
Expedition EL/Navigator L vehicles

10. Detach the 3 safety canopy module rear tether cord routing clip pin-type retainers from the sheetmetal.



11. **NOTE:** Note the locator tab on the rear tether cord anchor bracket to the D-pillar sheetmetal for installation.

    Remove the bolt and the safety canopy module rear tether cord anchor bracket from the D-pillar.

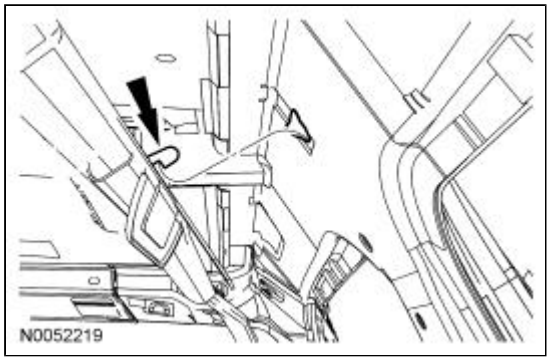


All vehicles

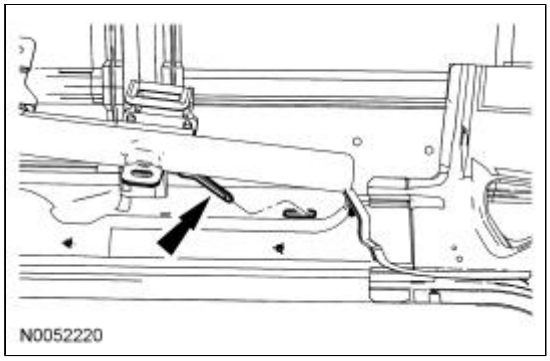
12. Remove the C-pillar safety canopy module bolt.

13. Remove the 2 safety canopy module rear bolts and the one roof bracket bolt.

14. Gently lift the safety canopy module up and inward at the B-pillar to release the bracket hook from the sheetmetal.



15. Move the safety canopy module forward to release the rear bracket hook from the sheetmetal and remove the safety canopy module.



Installation

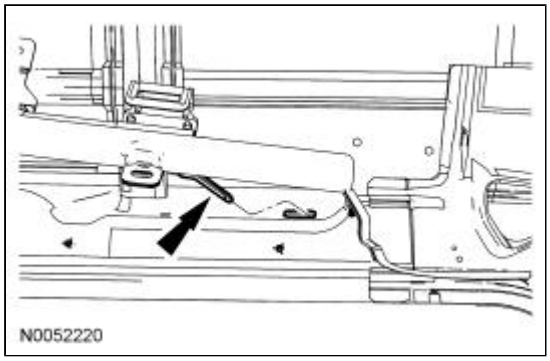
All vehicles

1. **WARNING: Before installing the safety canopy module, inspect the roofline for any damage. If necessary, the sheet metal must be reworked to its original condition and structural integrity. All damaged fasteners must be replaced and any foreign objects removed. Failure to do so may result in personal injury in the event of a safety canopy module deployment.**

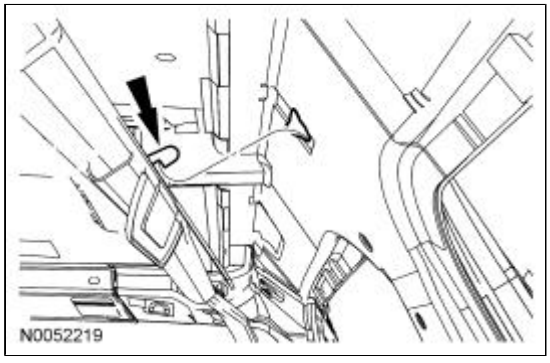
   WARNING: Before installing the safety canopy module, if the module is damaged or the cover has separated or the safety canopy material has been exposed, install a new safety canopy module. Do not attempt to repair the safety canopy. Failure to follow these instructions could result in personal injury in the event of a safety canopy deployment.

   WARNING: Never put any type of fastener or tie strap around any part of the safety canopy module or interior trim panel. This will prevent the safety canopy module from deploying correctly. Failure to do so can result in personal injury in the event of a safety canopy module deployment.

   Position safety canopy module by moving it rearward installing the rear bracket hook in the sheetmetal.



2. Install the safety canopy module B-pillar bracket hook in the sheetmetal.



3. Install the safety canopy module B-pillar bracket bolt.
    - Tighten to 9 Nm (80 lb-in).

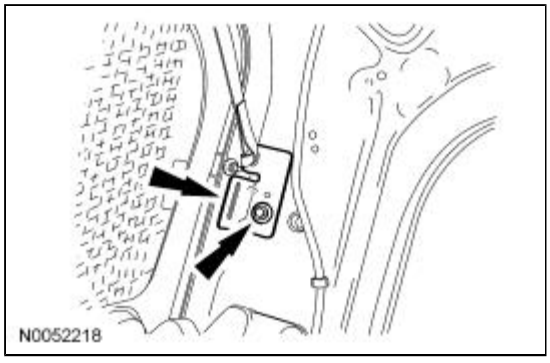
4. Install the safety canopy module roof bracket bolt.
    - Tighten to 9 Nm (80 lb-in).

5. Install the 2 safety canopy module rear bolts.
    - Tighten to 9 Nm (80 lb-in).

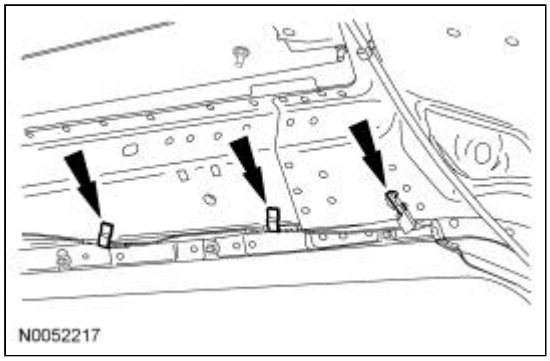
6. Install the C-pillar safety canopy module bolt.
    - Tighten to 9 Nm (80 lb-in).

Expedition EL/Navigator L vehicles

7. Install the safety canopy module rear tether cord anchor bracket and bolt to the D-pillar.
    - Tighten to 9 Nm (80 lb-in).



8. Attach the 3 safety canopy module rear tether cord routing clip pin-type retainers to the sheetmetal.



Expedition/Navigator vehicles

9. Install the safety canopy module rear tether cord anchor bracket and bolt to the D-pillar.
    - Tighten to 9 Nm (80 lb-in).

10. Attach the safety canopy module rear tether cord routing clip pin-type retainer to the sheetmetal.

All vehicles

11. Install the 2 safety canopy module front bolts.
    - Tighten to 9 Nm (80 lb-in).

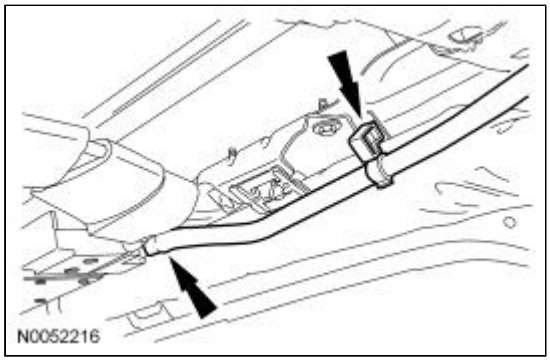
12. Install the 2 front tether cord pin-type retainers to the A-pillar sheetmetal.

13. Install the front tether cord bracket and bolt to the A-pillar.
    - Tighten to 6 Nm (53 lb-in).

14. Connect the safety canopy module electrical connector.

Vehicles with a moonroof

15. Connect the moon roof rear drain hose and attach the drain hose retainer to the coat hook bracket.



All vehicles

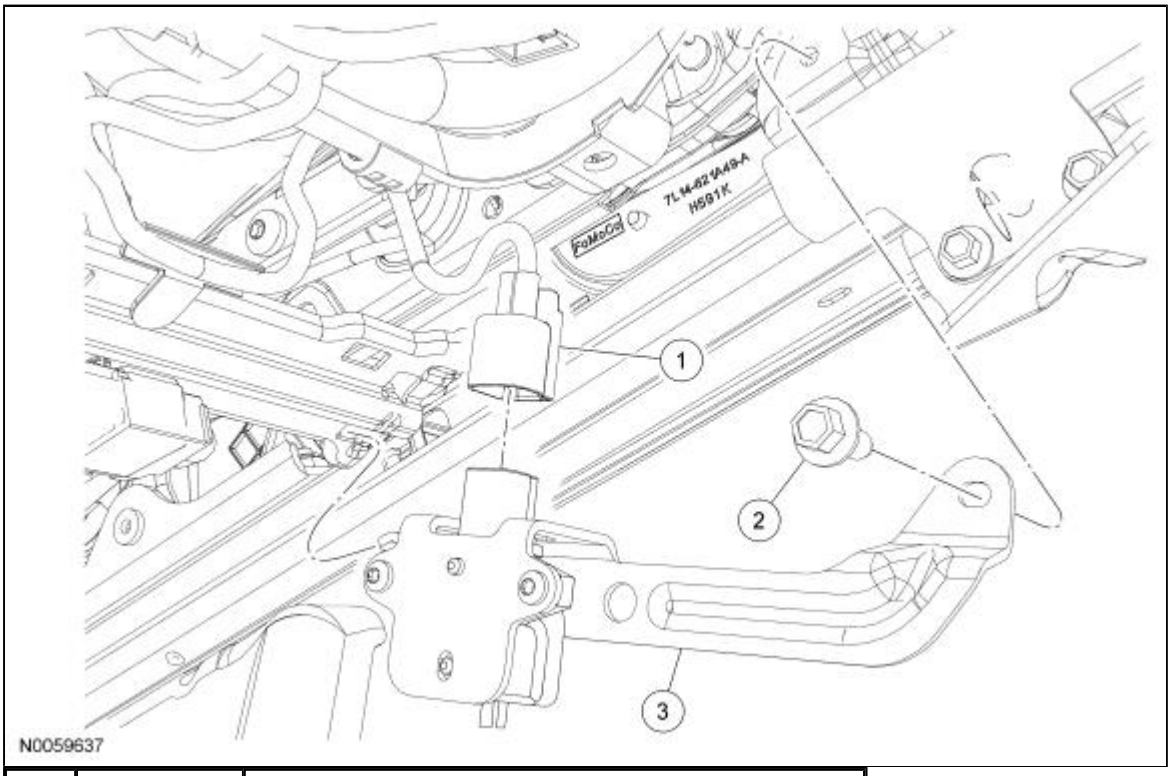
16. Install the headliner. For additional information, refer to Section 501-05 .

17. Repower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

Seat Position Sensor

Printable View (201 KB)

NOTE: Power seat shown, manual similar.



Item	Part Number	Description
1	—	Seat position sensor electrical connector (part of 14A699)
2	—	Seat position sensor and bracket bolt (part of 14B416)
3	14B416	Seat position sensor and bracket

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

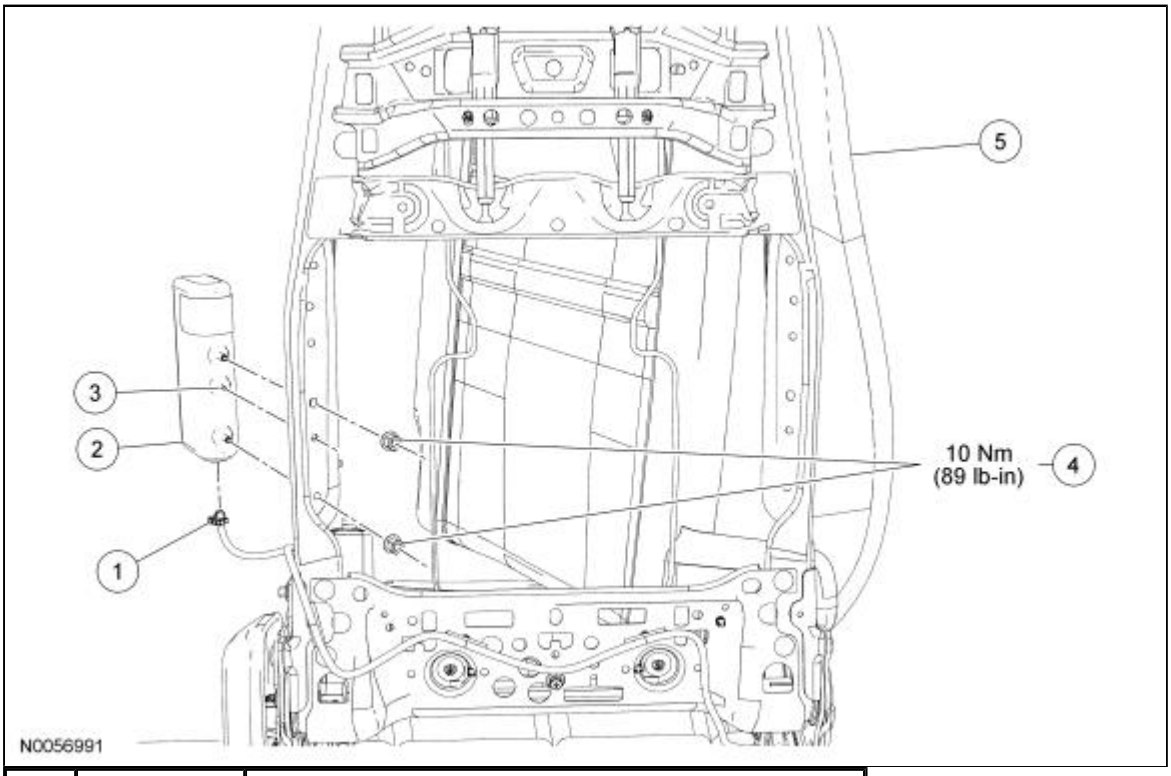
NOTE: Power seat track seat position sensor shown, manual seat track position sensor similar.

1. Raise the driver seat and then position it to the rear of the track.
2. Depower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.
3. Remove the seat position sensor and bracket bolt.
4. Unhook the seat position sensor and bracket from the seat track cross brace.
5. Disconnect the seat position sensor electrical connector and remove the seat position sensor and bracket.
6. To install, reverse the removal procedure.
7. Repower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

Side Air Bag Module

Printable View (232 KB)

NOTE: Driver side shown, passenger similar.



Item	Part Number	Description
1	—	Side air bag module electrical connector (part of 14K155)
2	611D10	Side air bag module
3	—	Side air bag module locator pin (part of 611D10)
4	N620480	Side air bag module nuts (2 required)
5	—	Seat backrest trim cover and foam pad

Removal and Installation

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Carry a live side air bag module with the air bag and tear seam pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Do not set a live side air bag module down on the cover tear seam. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: Side air bag modules with damaged covers must be replaced.

WARNING: Front seat back trim covers installed on seats equipped with side air bags cannot be repaired, they are to be replaced. Cleaning is permissible.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: If a side air bag deployment took place, a new seat back pad, trim cover, side air bag module and nuts must be installed. The seat back frame should be replaced if necessary. For additional information, refer to front seat backrest disassembly and assembly procedure in Section 501-10 .

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system SRS fault.

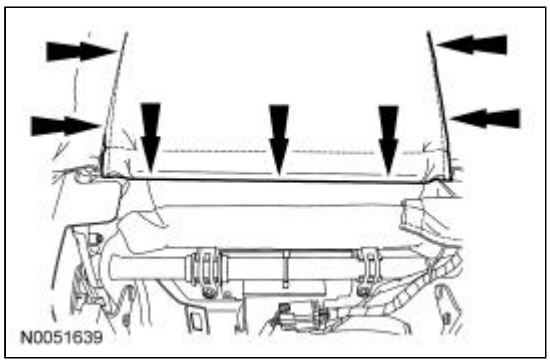
NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

1. Position the affected seat and backrest fully up and forward.

2. Depower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

3. Release the seat backrest cover lower rear J-clip, then unzip the 2 side zippers.

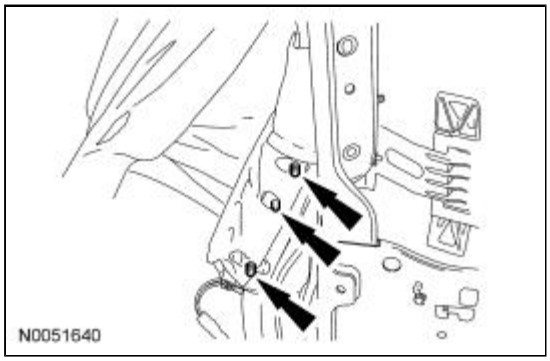


4. **NOTE:** Note the position of the side air bag module locator pin to the seat backrest frame for installation.

   Remove the 2 side air bag module nuts.
   - To install, tighten to 10 Nm (89 lb-in).

5. **NOTE:** Note the position of the side air bag module locator pin and mounting studs in the seat backrest trim cover deployment chute for installation.

Position the seat backrest foam aside and remove the side air bag module from the seat backrest frame. Then slide the side air bag module out of the seat backrest trim cover deployment chute.



6. Disconnect the electrical connector and remove the side air bag module.

7. **WARNING: Check the side air bag module deployment chute for damage. The side air bag module deployment chute must not be repaired. If there is any damage to the side air bag module deployment chute, a new seat back trim cover and side air bag module deployment chute must be installed as a unit.**

   WARNING: Inspect the mounting surfaces of the side air bag module for any foreign objects before installing the side air bag module. If any foreign objects are found, remove them. Failure to do so may result in personal injury, in the event of an air bag deployment.

   WARNING: If the side air bag module cover has separated or the side air bag module material has been exposed, install a new side air bag module. Do not attempt to repair the side air bag module. Failure to do so may result in personal injury in the event of an air bag deployment.

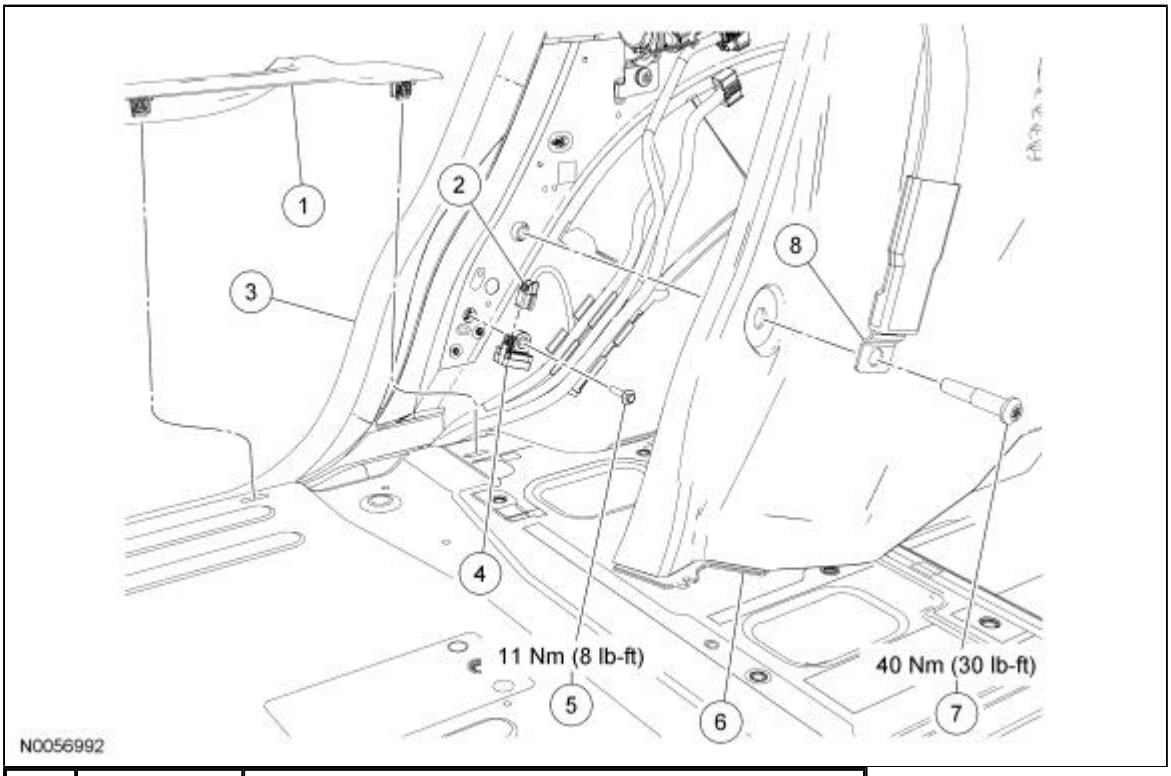
   To install, reverse the removal procedure.

8. Repower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

Side Impact Sensor — C-Pillar

Printable View (185 KB)

NOTE: Expedition/Navigator shown, Expedition EL/Navigator L similar.



Item	Part Number	Description
1	13228	Rear door scuff plate
2	—	Side impact sensor electrical connector (part of 14A005)
3	253A10	Rear door weatherstrip
4	14B345	Side impact sensor
5	W711619	Side impact sensor bolt
6	31012	Quarter trim panel
7	—	Second row safety belt retractor anchor bolt (part of 611B68)
8	—	Second row safety belt retractor anchor (part of 611B68)

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag SRS is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. Install and correctly position the sensor or any other damaged

SRS components whether or not the air bag is deployed.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

NOTE: RH side shown, LH similar.

1. Depower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. Remove the rear door scuff plate.

3. Detach the rear door weatherstrip.

4. **NOTE:** Make sure the second row safety belt retractor belt webbing is not twisted prior to installation.

   Remove the bolt and second row safety belt retractor anchor.
   - To install, tighten to 40 Nm (30 lb-ft).

5. Position aside the quarter trim panel.
   - Pull out on the quarter trim panel at the C-pillar to release the retaining clips to access the C-pillar side impact sensor.

6. **WARNING: The tightening torque of the side impact sensor retaining bolt is critical for correct system operation.**

   NOTE: Note the position of the side impact sensor locating tab for installation.

   NOTE: Make sure the C-pillar and side impact sensor mating surfaces are clean and free of foreign material.

   Remove the side impact sensor bolt.
   - To install, tighten to 11 Nm (8 lb-ft).

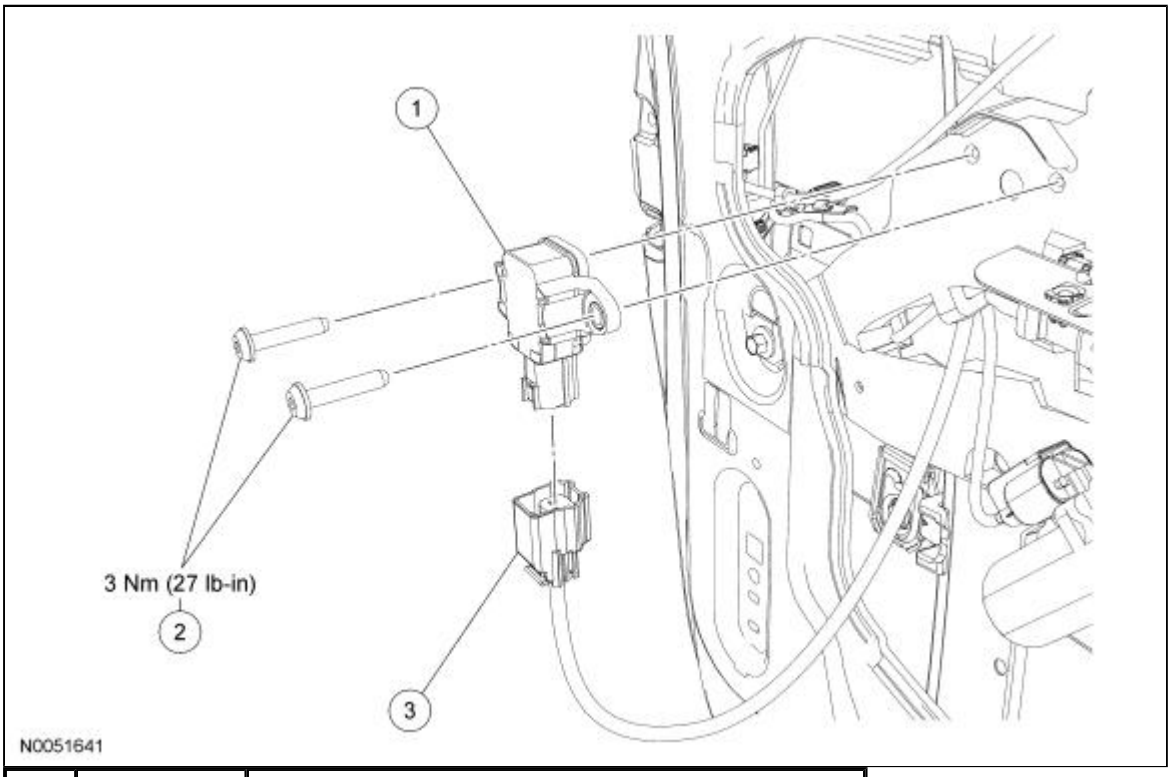
7. Disconnect the electrical connector and remove the side impact sensor.

8. To install, reverse the removal procedure.

9. Repower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

Side Impact Sensor — Front Door

Printable View (206 KB)



Item	Part Number	Description
1	14B345	Side impact sensor
2	W506966	Side impact sensor screws (2 required)
3	—	Side impact sensor electrical connector (part of 14631A)

Removal and Installation

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag SRS is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. Install and correctly position the sensor or any other damaged SRS components whether or not the air bag is deployed.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: Avoid applying corrosion protection to any safety, mechanical and electrical parts, electric motors, speakers, door locks and drain holes.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed

and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

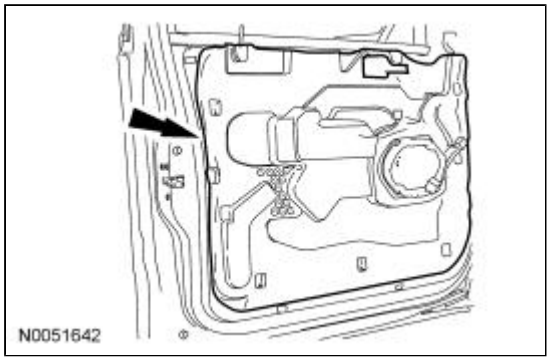
NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

NOTE: Driver side shown, passenger similar.

1. Depower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. Remove the front interior door trim panel on the side with the affected side impact sensor. For additional information, refer to Section 501-05 .

3. Separate the weathershield from the door enough to access the side impact sensor.



4. Disconnect the side impact sensor electrical connector.

5. **WARNING: The tightening torque of the side impact sensor retaining screws is critical for correct system operation.**

   NOTE: Make sure the side impact sensor mating surfaces are clean and free of foreign material.

   NOTE: Note the position of the side impact sensor locating tab for installation.

   Remove the 2 screws and side impact sensor.
   - To install, tighten to 3 Nm (27 lb-in).

6. To install, reverse the removal procedure.

7. Repower the system. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

Body

Printable View (990 KB)

The body consists of the following:

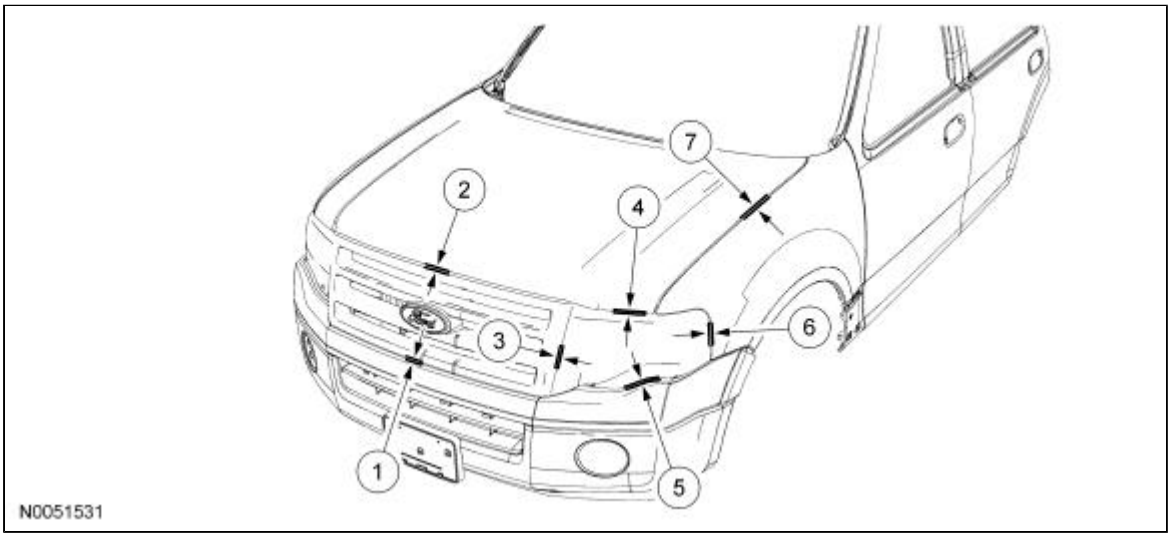
- Body-on full-frame design
- High-strength low alloy (HSLA), high-strength and mild steels
- Unique front structure constructed of high-strength hydroformed steel tubes
- Upper rail of radiator support constructed of magnesium
- Lower rail of radiator support constructed of hydroformed high-strength steel
- Expedition hood constructed of aluminum
- Navigator hood constructed of sheet-molded compound (SMC) plastic
- Bolt-on high-strength front bumper beam
- Expedition and Navigator have unique front fascia, grille and headlamps
- Bolted, removable front fenders, hinged doors, liftgate and hood
- Steel doors
- Steel fenders
- Steel quarter panels
- Expedition and Navigator liftgate constructed of aluminum
- Welded-on high-strength rear bumper beam
- Standard 3,023 mm (119.01 in) and optional 3,327 mm (130.98 in) wheelbase
- Structural adhesive used in rear sill and quarter panel D-pillar inner to outer panel
- Structural foam with nylon insert used in D-pillar

For dimensional information, refer to the following illustrations:

Body Margins

NOTE: Expedition shown, Navigator similar.

NOTE: Dimensions apply to right and left side.

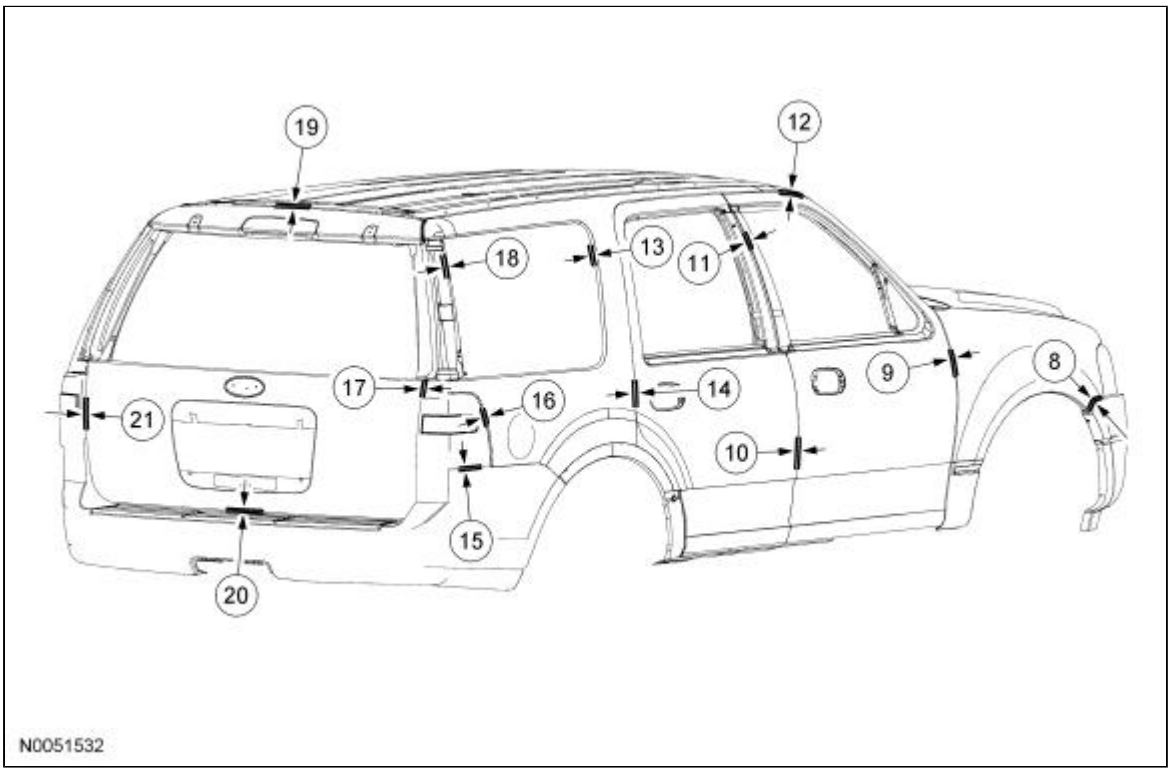


Item	Description	Specification
1	Grille to fascia	2.0 mm (0.07 in) ± 0.5 mm (0.01 in)

2	Hood to grille	6.5 mm (0.25 in) ± 2.5 mm (0.09 in)
3	Headlamp to grille	4.0 mm (0.15 in) ± 2.5 mm (0.09 in)
4	Hood to headlamp	6.5 mm (0.25 in) ± 2.5 mm (0.09 in)
5	Headlamp to fascia	4.0 mm (0.15 in) ± 2.0 mm (0.07 in)
6	Fender to headlamp	4.0 mm (0.15 in) ± 2.0 mm (0.07 in)
7	Hood to fender	4.5 mm (0.17 in) ± 2.0 mm (0.07 in)

Body Margins

NOTE: Dimensions apply to right and left side.

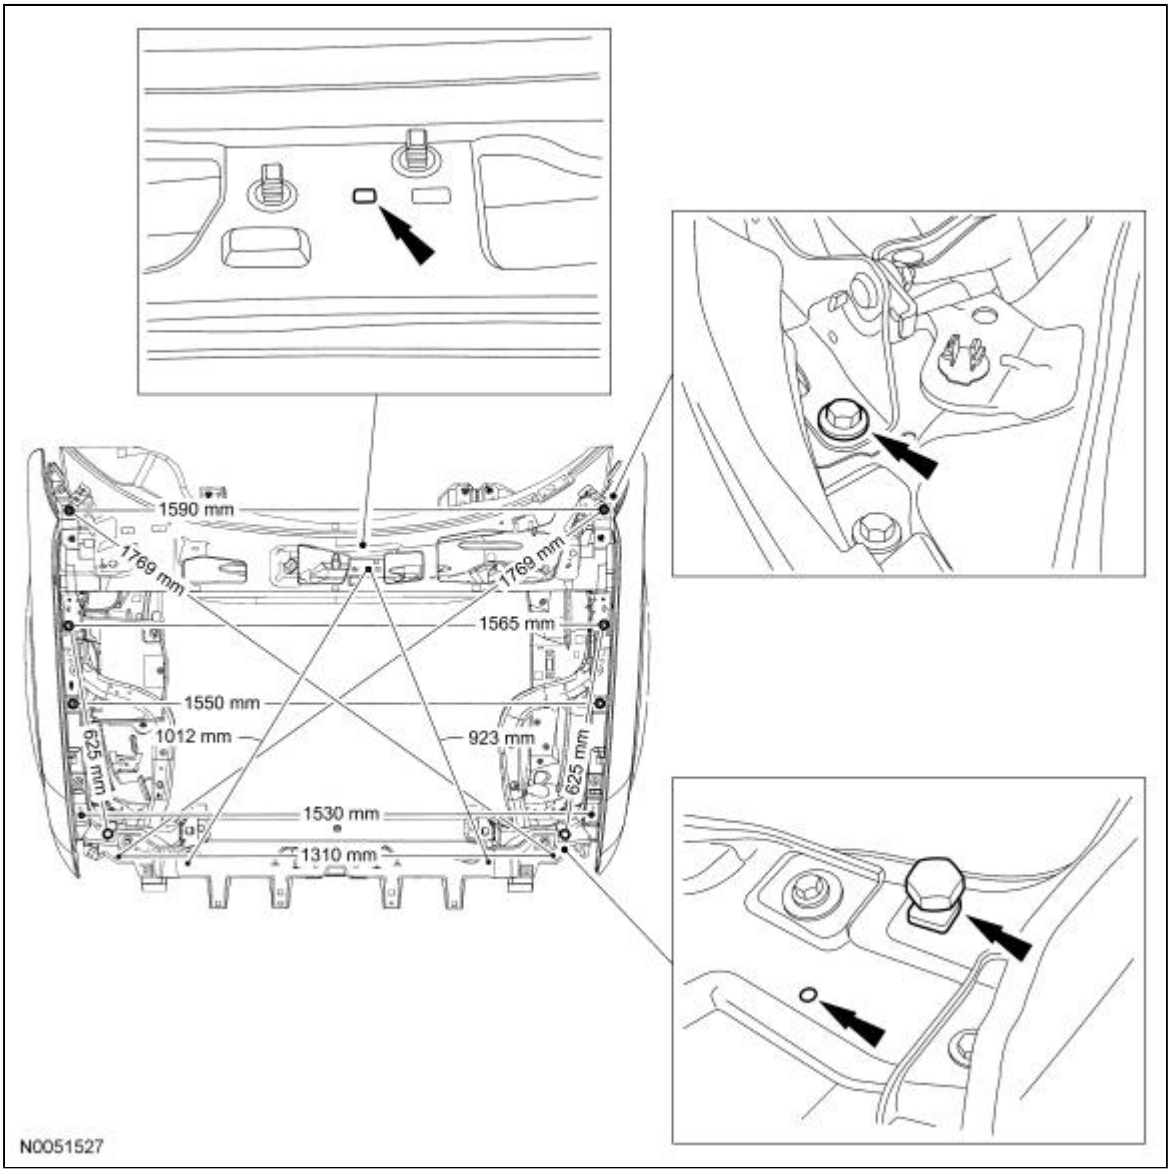


Item	Description	Specification
8	Fascia to fender	0.0 mm (in) ± 1.5 mm (0.05 in)
9	Front door to fender	4.5 mm (0.17 in) ± 2.0 mm (0.07 in)
10	Front door to rear door	4.5 mm (0.17 in) ± 2.0 mm (0.07 in)
11	Front door to rear door (upper)	4.5 mm (0.17 in) ± 2.0 mm (0.07 in)
12	Door to roof	5.0 mm (0.19 in) ± 0.5 mm (0.01 in)
13	Glass to quarter panel	5.0 mm (0.19 in) ± 2.5 mm (0.09 in)
14	Rear door to quarter panel	4.5 mm (0.17 in) ± 2.5 mm (0.09 in)
15	Tail lamp to rear fascia	4.0 mm (0.15 in) ± 2.0 mm (0.07 in)
16	Tail lamp to quarter panel	2.0 mm (0.07 in) ± 1.5 mm (0.05 in)
17	Liftgate to quarter panel	5.0 mm (0.19 in) ± 2.5 mm (0.09 in)
18	Glass to D-pillar outer panel	5.5 mm (0.21 in) ± 2.5 mm (0.09 in)
19	Liftgate to roof	10.0 mm (0.39 in) ± 2.5 mm (0.09 in)
20	Liftgate to fascia	3.0 mm (0.11 in) ± 1.0 mm (0.03 in)

21	Liftgate to quarter panel	5.0 mm (0.19 in) ± 2.5 mm (0.09 in)

Underhood Dimensions

NOTE: Measurements are obtained on center, unless otherwise indicated.

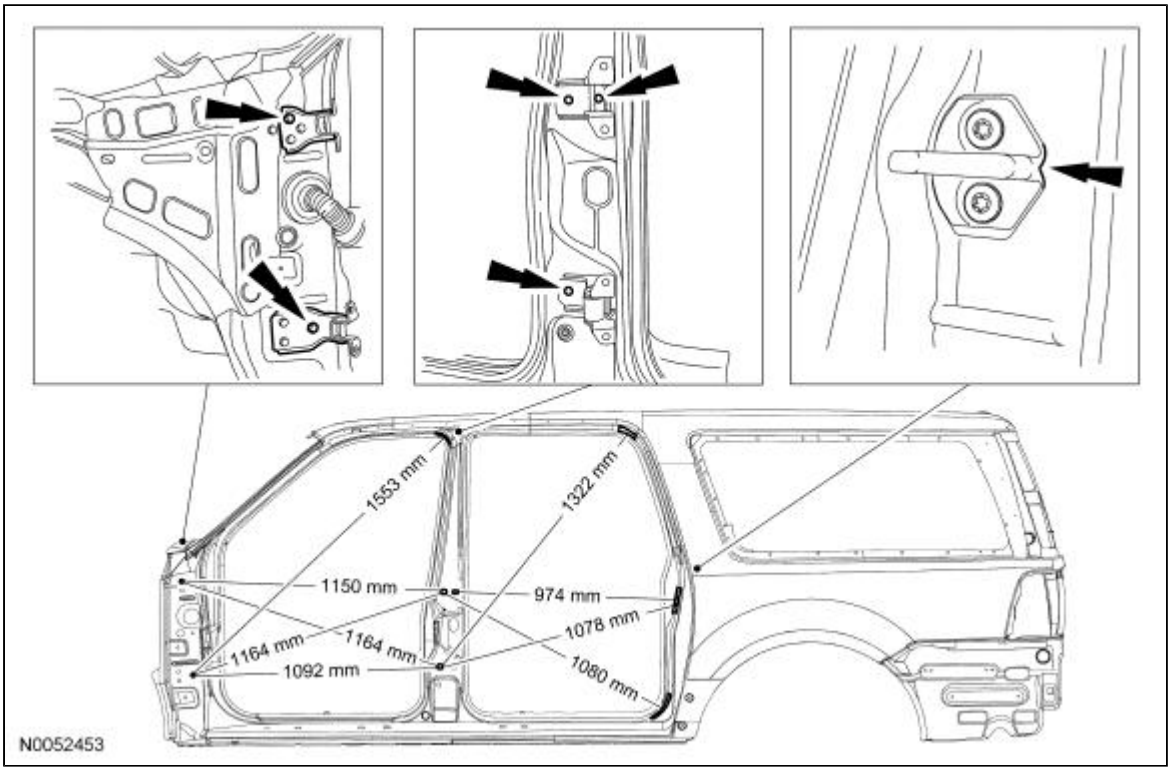


Bodyside Dimensions

NOTE: Measurements are obtained on center, unless otherwise indicated.

NOTE: Expedition 3,327 mm (130.98 in) extended wheelbase shown, front door opening is common to all models.

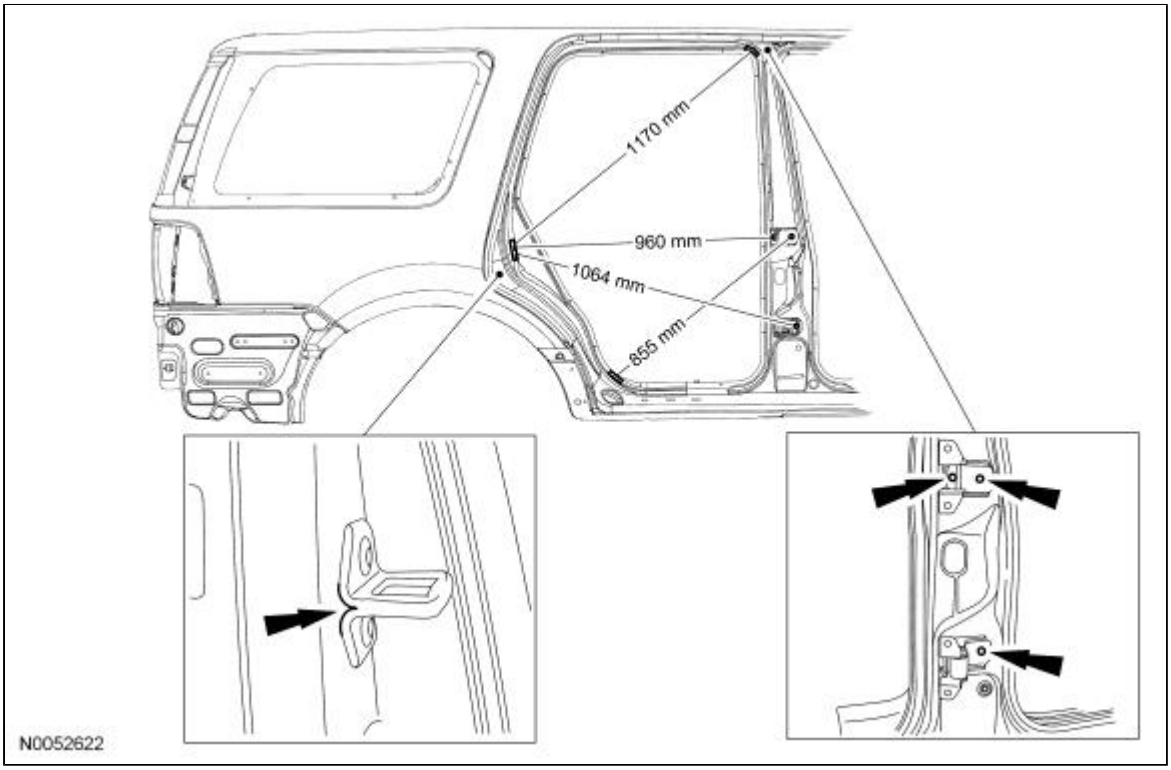
NOTE: Dimensions apply to right and left side.



Rear Door Opening — 3,023 mm (119.01 in) Wheelbase

NOTE: Dimensions apply to right and left side.

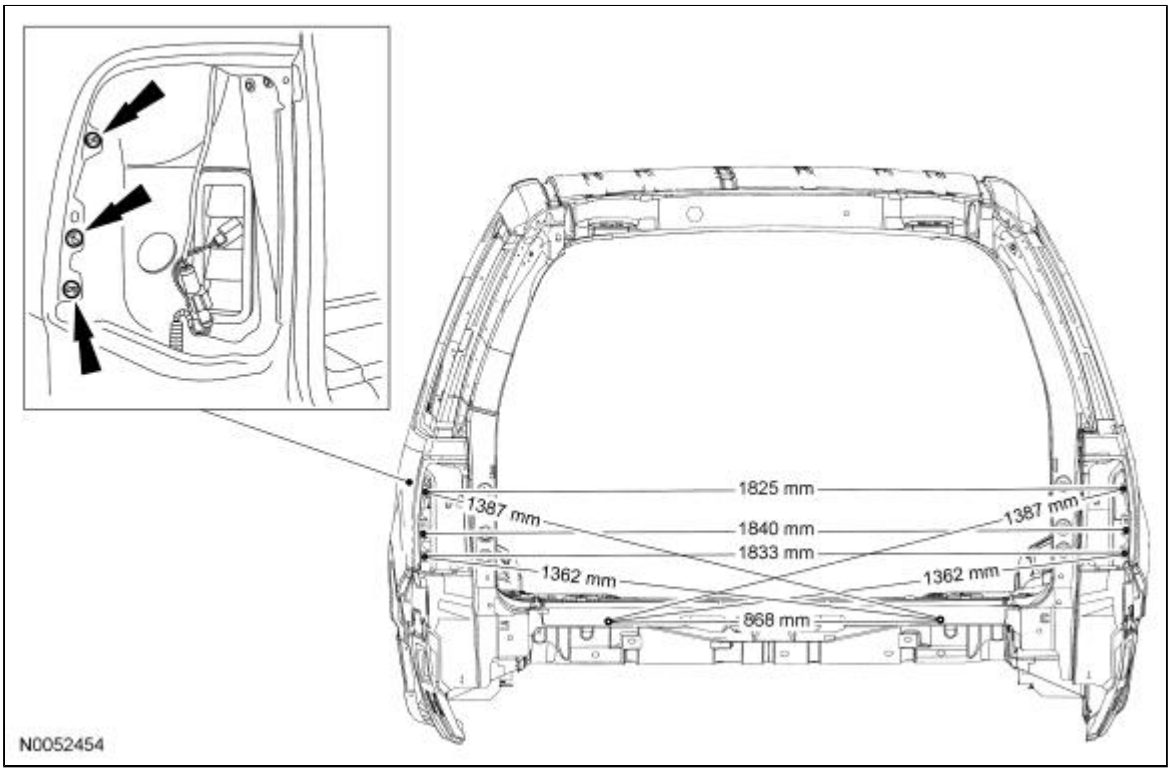
NOTE: Measurements are obtained on center, unless otherwise indicated.



Body Rear Opening Dimensions

NOTE: Dimensions common to all models.

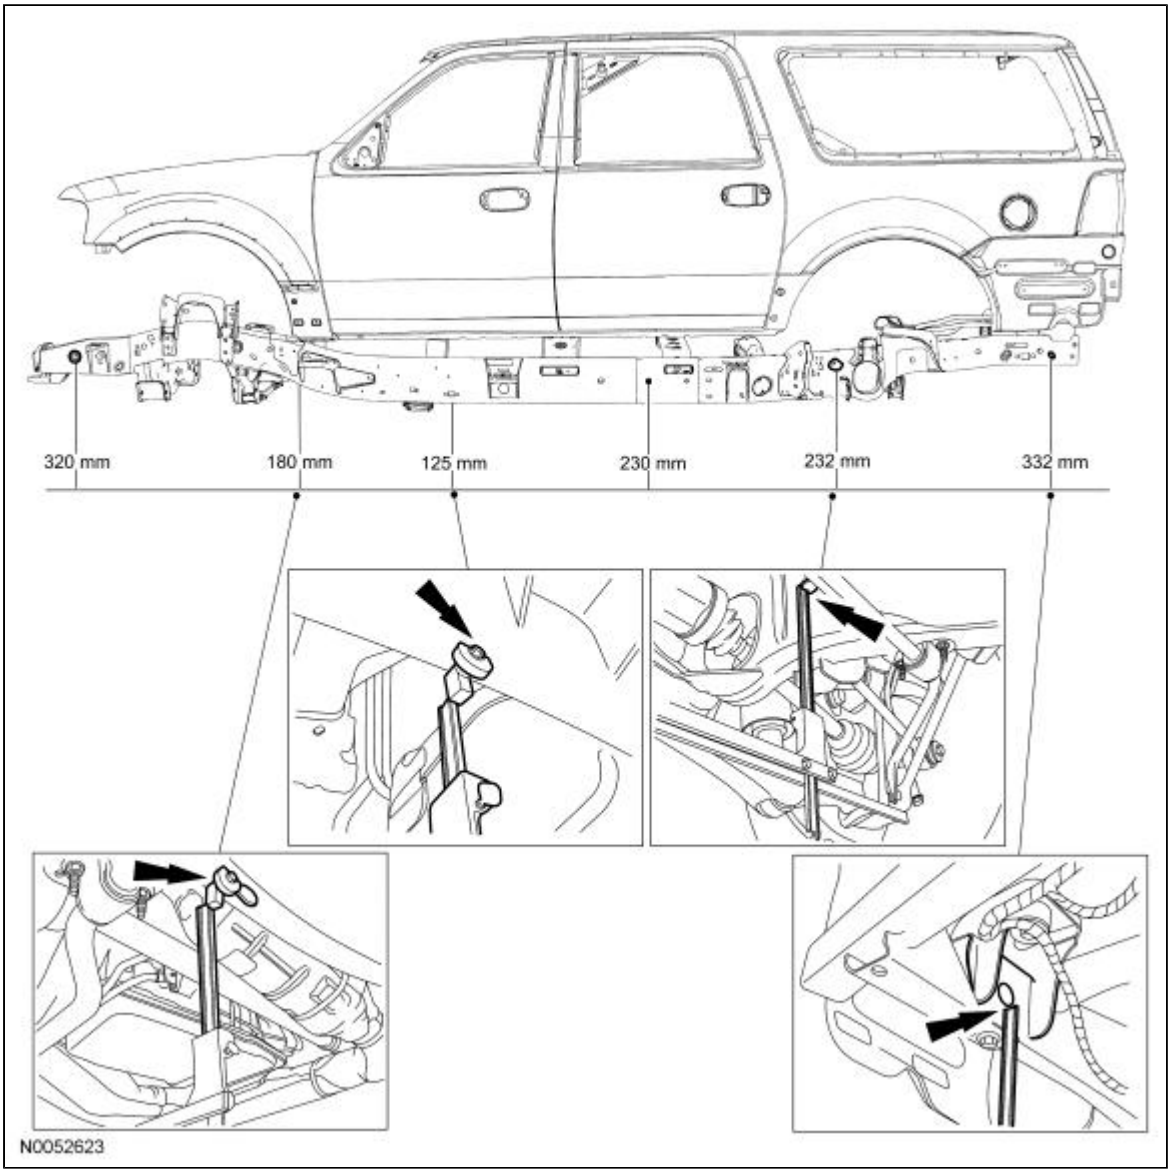
NOTE: Measurements are obtained on center, unless otherwise indicated.



Underbody Dimensions

Frame Datum Height

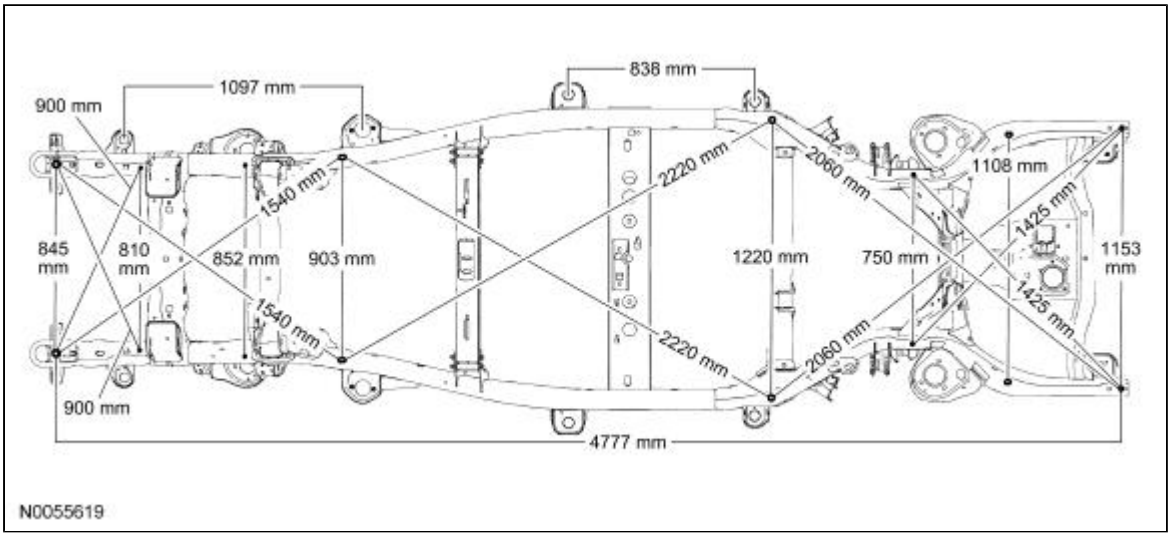
NOTE: Datum measurements indicated from front (No. 1) to the rear (No. 6). The gauge for the No. 3 datum measurement is located 28 mm (1.1 in) rearward from the transmission No. 3 crossmember flange. Inset views indicated from left side.



Frame Dimensions — 3,023 mm (119.01 in) Wheelbase

NOTE: Measurements are obtained on center, unless otherwise indicated.

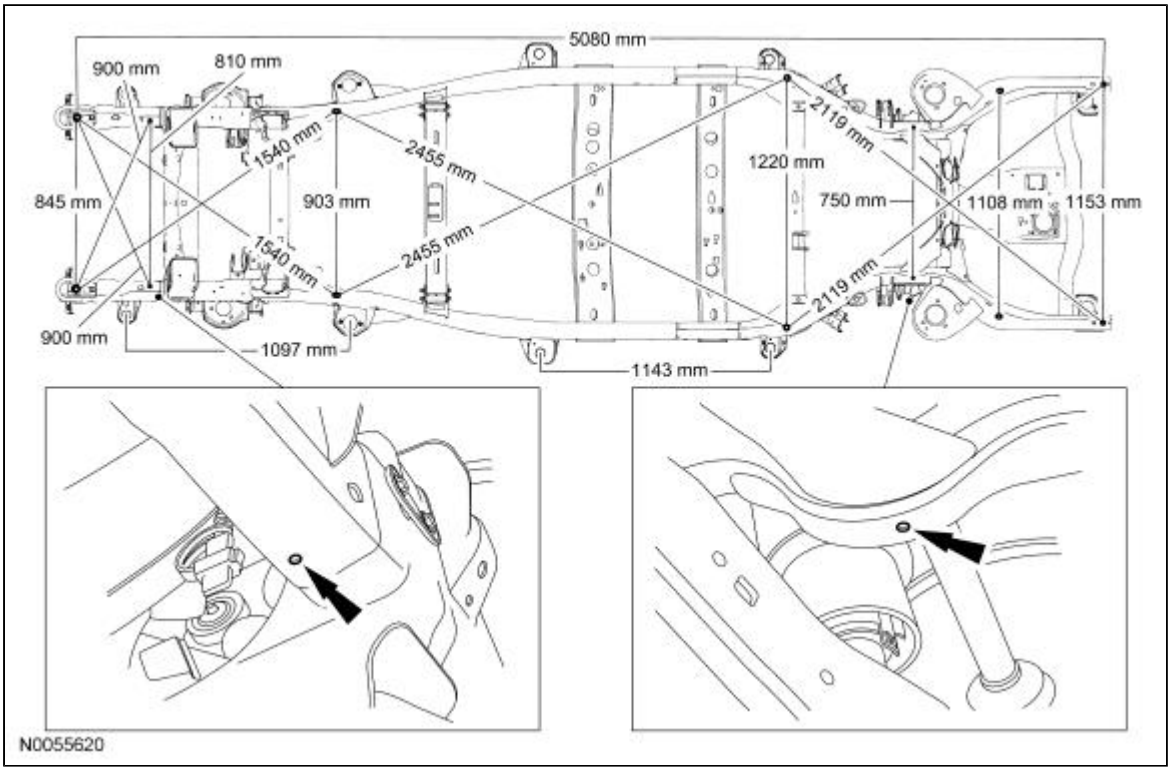
NOTE: A structural frame rail sectioning kit is available for the front frame rail section. It is mandatory to maintain factory frame dimensions when carrying out any repair procedure to the frame. Refer to Frame Members in this section.



Frame Dimensions — 3,327 mm (130.98 in) Wheelbase

NOTE: Measurements are obtained on center, unless otherwise indicated.

NOTE: A structural frame rail sectioning kit is available for the front frame rail section. It is mandatory to maintain factory frame dimensions when carrying out any repair procedure to the frame. Refer to Frame Members in this section.



Welding Precautions — Aluminum

Printable View (64 KB)

Correct equipment and cleaning procedures must be used when welding aluminum. Gas-metal-arc-welding (GMAW) or MIG and Gas-tungsten-arc-welding (GTAW) or TIG are used for welding aluminum and aluminum alloys.

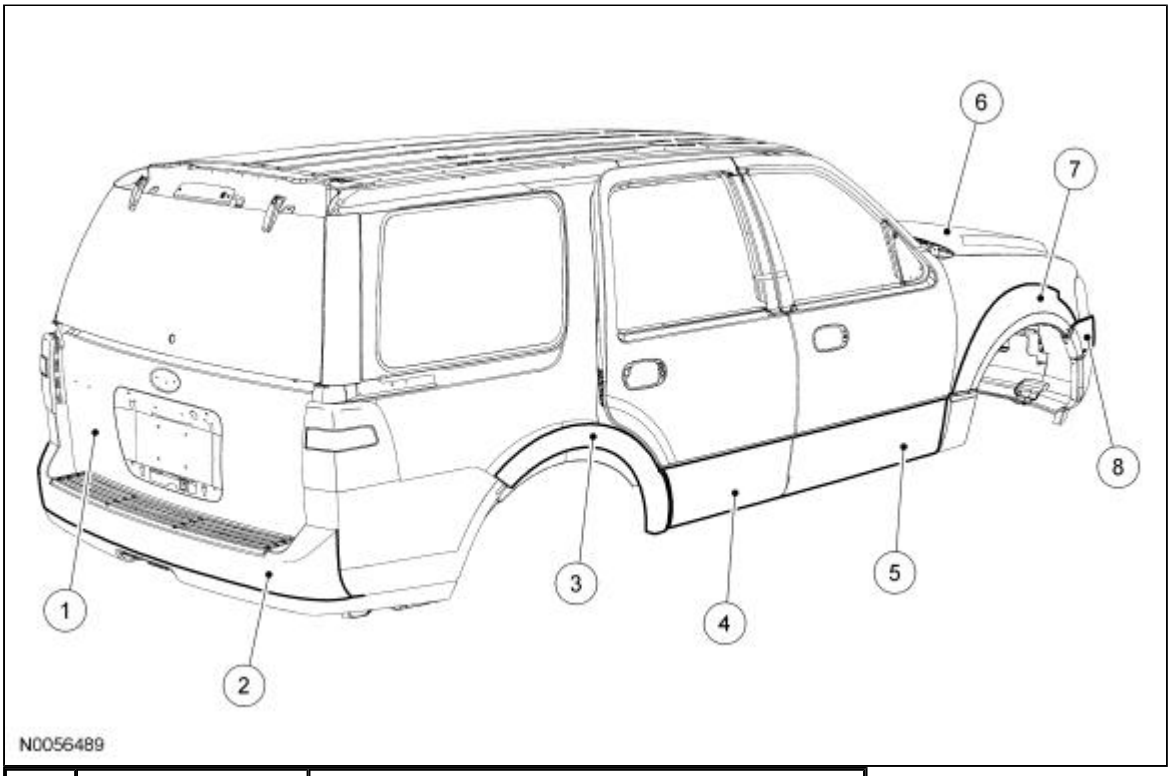
- The correct protective clothing should always be worn.
- Proper ventilation must be provided to avoid the accumulation of poisonous gases.
- Disconnect the battery ground cable from the battery.
- Disconnect on-vehicle modules and protect them from possible heat damage and electrical currents when welding.
- Use a stainless steel wire brush to remove aluminum oxides.
- Make sure the surface is clean and free of foreign materials.
- Use degreasers that do not contain hydrocarbons.
- Do not use a wire brush that has been used on stainless or carbon steel.
- Follow equipment manufacturer's prescribed procedures as aluminum and aluminum alloys have a higher thermal conductivity and lower melting point which can lead to easier burn through.
- A test weld should always be carried out on a test sample.
- Preheating the aluminum workpiece can help prevent weld cracking. The preheating temperature should not exceed 110°C (230°F).
- Use a temperature indicator to prevent overheating.
- Attach the ground clamp as close as possible to the work area.
- Types of filler rods to use when TIG welding aluminum:
  - Aluminum-silicon alloy.
  - Aluminum-magnesium alloy.
- Adequate power supply needs to be used to make sure of correct equipment performance.
- Corrosion protection needs to be restored whenever it is necessary to sand or grind through painted surfaces or E-coat, or when bare metal repairs are carried out. Refer to Restoring Corrosion Protection Following Repair in this section.

Plastic Components

Printable View (162 KB)

Exterior Plastic Components — Painted

NOTE: The following illustration(s) are not all-inclusive of trim levels available. The actual trim level of the vehicle will determine the viability of carrying out a plastic repair.



Item	Part Number	Description
1	40010	Liftgate (Navigator) — Sheet-molded compound (SMC)
2	17K835	Bumper cover (rear) — Thermoplastic polyolefin (TPO)
3	25557 LH/ 25556 RH	Wheel arch molding (rear) — TPO
4	20879 LH/ 20878 RH	Door molding (rear) — TPO
5	20879 LH/ 20878 RH	Door molding (front) — TPO
6	16612	Hood (Navigator) — SMC
7	16039 LH/ 16038 RH	Wheel arch molding (front) — TPO
8	17D597	Bumper cover (front) — TPO

Several considerations will determine viability of plastic repair procedure(s):

- Is the damage cosmetic or structural?

- Can the repair be carried out on the vehicle?
- Is the part readily available?
- Is component repair the most cost effective method?
- Can the component be economically restored to original strength and appearance?
- Will the repair provide for the fastest, highest quality repair?

Several types of plastic are in use for automotive application. However, all plastics will fall into 2 primary categories of thermoplastic or thermosetting plastic.

Thermosetting Plastic

Generally, thermosetting plastics are made with 2-part thermosetting resins. When mixed together, heat is generated, producing a cure that is irreversible. Because of this, thermosetting plastics will require the use of a 2-part adhesive for repair.

Sheet-Molded Compound

Sheet-molded compound (SMC) is a type of thermosetting plastic that uses glass fibers or nylon fibers in combination with thermosetting polyester resins. When fully cured, SMC is strong and rigid.

SMC is similar to, but not identical to, fiberglass. Ford Motor Company uses SMC in components such as fenders, hoods and liftgates.

Thermoplastic Compounds

Thermoplastic compounds are manufactured by a process that is reversible. Thermoplastics can be remolded repeatedly by reheating. This characteristic of thermoplastics makes plastic welding a possible repair alternative. A repair of thermoplastic compounds is still possible through the use of 2-part adhesive and filler repair materials and reinforcements as needed. Thermoplastics are widely used in interior trim components, wheel flares, body side cladding and bumper covers.

Polyolefin

Polyolefins fall into the family of thermoplastics with one unique characteristic, an oily or waxy feel to the material when sanded or ground. Polyolefin lends itself very well to remolding through the use of heat. Because of this, components made of this material lend themselves well to the possibility of plastic welding. Most adhesive repair materials and paint will not bond to a surface of polyolefin unless an adhesion promoter specially formulated for plastic is first applied to the exposed raw surface. Otherwise, polyolefins are repaired like most other thermoplastics. Some typical uses of polyolefins are:

- bumper covers.
- fan shrouds.
- wheel housings.

Correct identification of the various types of plastic is necessary to select the appropriate repair method (s) to carry out high quality plastic repairs. Refer to Plastics Identification in this section.

Welding Precautions — Steel

Printable View (66 KB)

General Specifications

Item	Specification
Low Temperature Anti-Corrosion Coating PM-12-A	—

General Equipment
Pro 230 MIG Welder 208-00030
Heat Treatment Induction Resistance Spot Welder 254-00001

The correct equipment and settings must be used when welding mild or high strength steel. Metal inert gas (MIG) and squeeze-type resistance spot welding (STRW) are the preferred methods. Surfaces must be clean and free of foreign materials.

- Correct eye protection must be worn.
- The correct protective clothing should always be worn.
- Adequate ventilation must be provided to avoid accumulation of poisonous gases.
- A test weld should always be carried out on a test sample.
- Follow equipment manufacturer's prescribed procedures and equipment settings for the type of weld being used.
- Disconnect the battery ground cable from the battery.
- Disconnect on-vehicle modules and protect them from possible heat damage and electrical currents when welding.
- Use grinding discs and wire brushes dedicated to the type of material being welded.
- Follow equipment manufacturer's prescribed procedures and equipment settings for the type of weld being used. ER70S-2 or ER70S-6 wire are typically used for MIG welding steel.
- Components made of high-strength steel should not be heated to straighten or repair. Severely bent or kinked components should be replaced with new ones.
- Factory spot welds may be substituted with either resistance spot welds or MIG plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.

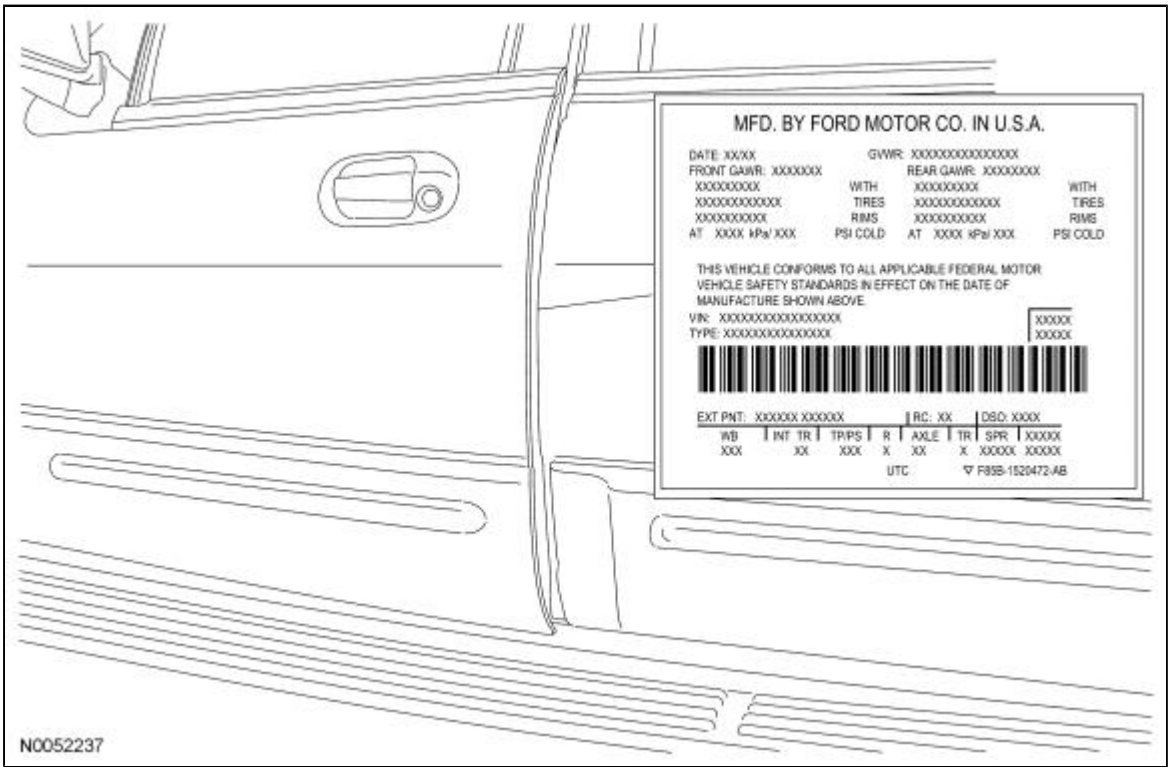
Arc welding is an acceptable method for welding heavier metal components such as frame parts. When arc welding, the following guidelines should be followed:

- Attach the ground clamp as close as possible to the work area.
- Choose welding electrodes according to the type of steel, thickness and polarity of the arc welder (AC or DC).
- Do not use water or compressed air to cool welding. This can cause the metal to become brittle and weak.
- Corrosion protection needs to be restored whenever it is necessary to sand or grind through painted surfaces or E-coat, or when bare metal repairs are carried out. Refer to Restoring Corrosion Protection Following Repair in this section.

Paint Codes

Printable View (180 KB)

Vehicle Certification Label Locator



Vehicle exterior paint codes can be found on the Vehicle Certification Label. All colors are base coat/clear coat.

Paint codes are listed as a 2-part code. The first set of characters listed identifies the vehicle primary paint color. The second set of characters listed (if applicable) identifies the vehicle accent or 2-tone color.

- DX — Dark Blue Pearl
- G2 — Redfire
- G3 — Pueblo Gold
- G4 — Alloy Gray
- JP — Silver Birch Metallic
- PG — Dark Amethyst
- PV — White Chocolate (tri-coat)
- T5 — Dark Copper
- UA — Ebony
- YZ — Oxford White

Sealers

Printable View (63 KB)

Material

Item	Specification
Clear Silicone Rubber TA-32	ESB-M4G92-A
Roof Ditch Sealer TA-15	—
Seam Sealer TA-2	—

The correct sealing of joints is essential to repairing the vehicle correctly. Sealers are used to prevent wind noise, water leaks, exhaust fumes and dust from entering the vehicle. They also provide anti-corrosion barriers. Sealers are applied to areas such as door and rear compartment hem flanges, wheelhouse, quarter outer, floor, cowl, roof and other panel-to-panel attaching points. The following joint sealers are recommended for use depending upon the application:

- Brushable Seam Sealer — A sealer intended to restore the original brushed seam appearance. It is used to seal lap joints in sheet metal that are spot welded (for example, floorpans and cowls).
- Roof Ditch Sealer — A self-leveling sealer used for drip rails, roof seams, quarter panels to rear deck and for water leaks.
- Seam Sealer — A fast curing, non-sag, paintable, permanently flexible sealer typically used for cosmetic seams, truck bed seams, floor pans and door skin seams.
- Clear Silicone Rubber — Used for sealing water leaks, noise concerns, remounting trim and repairing torn weatherstripping.

Sealers should remain flexible after curing and must be paintable. Follow the manufacturer's directions for correct application of these materials.

Any damage to originally sealed joints should be repaired by resealing. Along with attaching points of new panels, open joints that require bridging of sealer to close a gap should be sealed using a heavy-bodied sealer.

Adhesives

Printable View (238 KB)

Material

Item	Specification
Clear Silicone Rubber TA-32	ESB-M4G92-A
Trim and Weatherstrip Adhesive TA-14	—
Plastic Bonding Adhesive TA-9	—
Metal Bonding Adhesive TA-1	—
Metal Patch Panel Adhesive TA-3	—
Motorcraft Metal Surface Cleaner ZC-21	WSE-M5B392-A
Motorcraft Metal Surface Prep ZC-31	—
Seam Sealer TA-2	—

Adhesives are used in a variety of applications. Typical uses for adhesives include roof panels, door skins and quarter panels. Trim applications include body side mouldings, emblems, stationary glass and weatherstripping. Combination sealer/adhesives are also used. Surface preparation is critical to a high quality repair. Following the label instructions for the product is essential.

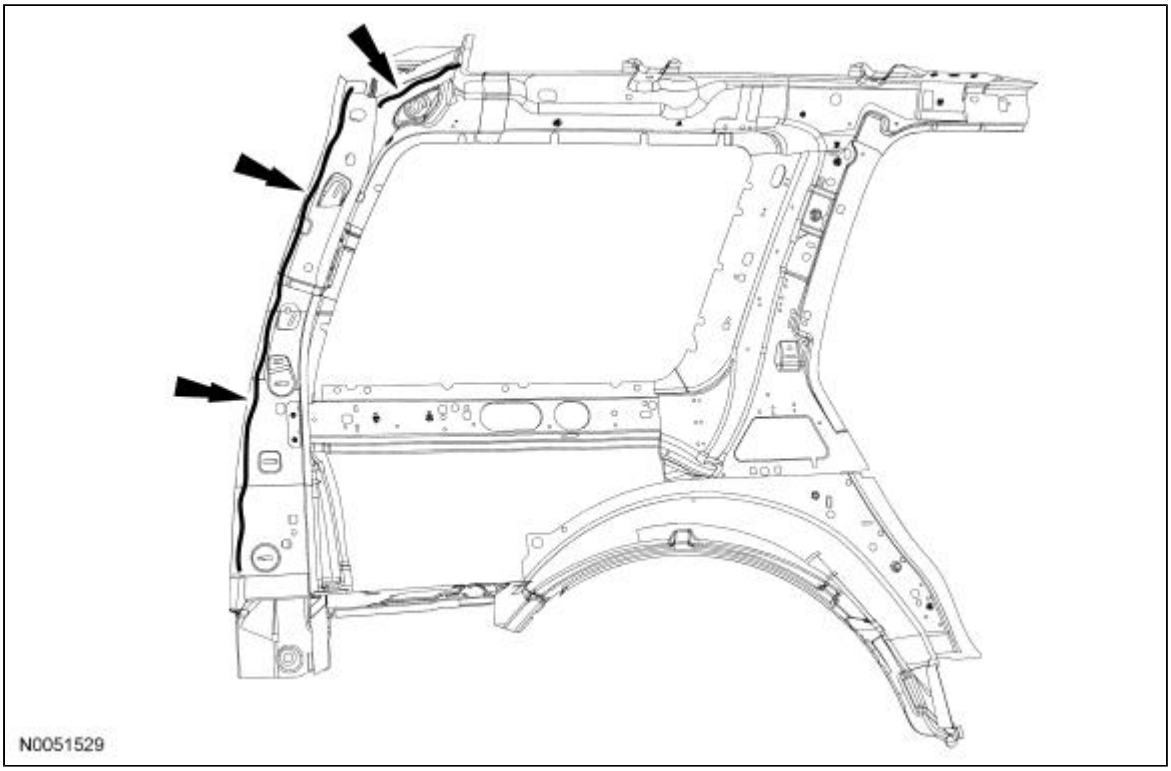
Work in a well-ventilated area and protect adjacent surfaces when working with adhesives. The use of eye protection and protective clothing is also recommended when working with adhesives. Carry out a trial fit, mark and align the surfaces before bonding the materials together.

Seam sealers and corrosion protection may be necessary once the adhesive(s) has cured, depending on the application. The following is a list of adhesives recommended for certain types of applications:

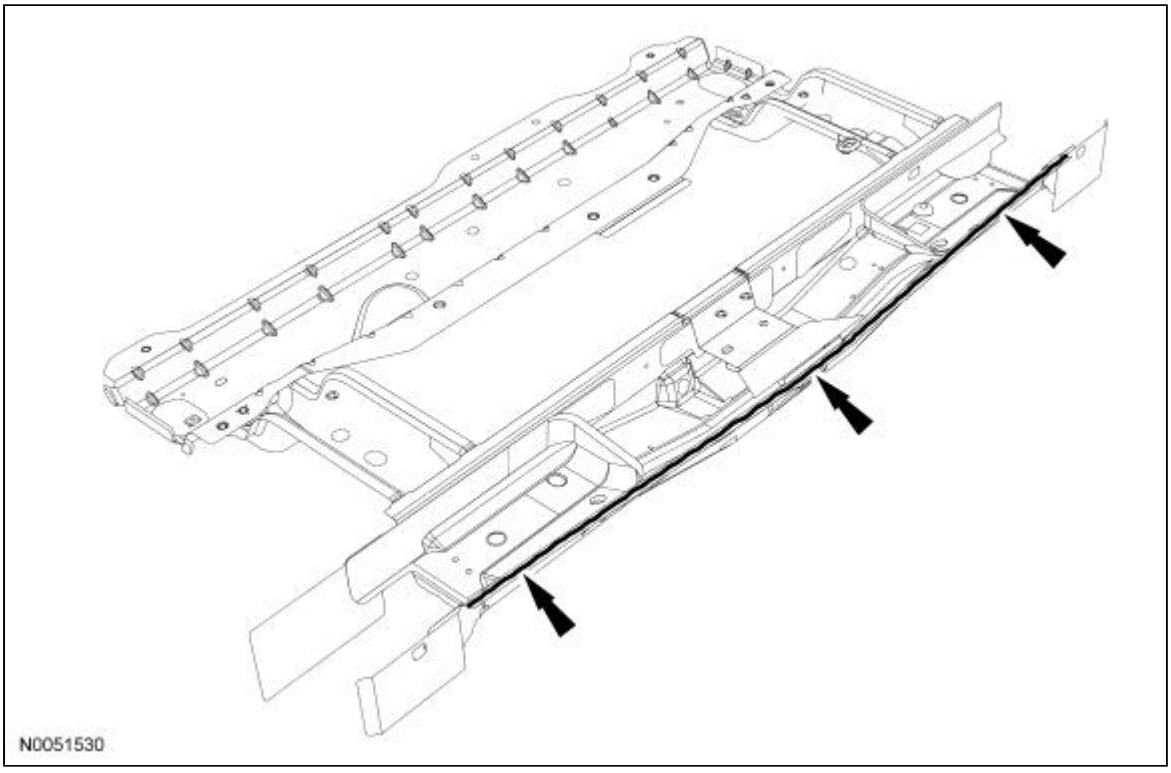
- Metal Bonding Adhesive — For bonding cold-rolled steel, galvanized steel, aluminum and correctly prepared E-coat. It is used for door skin and roof panel replacement and OEM structural adhesive replacement.
- Plastic Bonding Adhesive — For bonding a variety of plastics to plastics and plastics to primed, painted or E-coated metals. Also for general purpose bonding of trim components.
- Seam Sealer — Heavy-bodied, non-sag adhesive/sealer for use on: standing cosmetic seams, truck bed seams, tooled door skin seams and floor pans.
- Trim and Weatherstrip Adhesive — For use on body side moulding, emblems, trim, bumper impact strips and carpeting.
- Clear Silicone Rubber — Used for sealing water leaks, noise concerns, remounting trim and repairing torn weatherstripping.

NOTE: The following illustrations identify structural adhesive locations.

Quarter Panel Corner



Underbody — Rear Sill

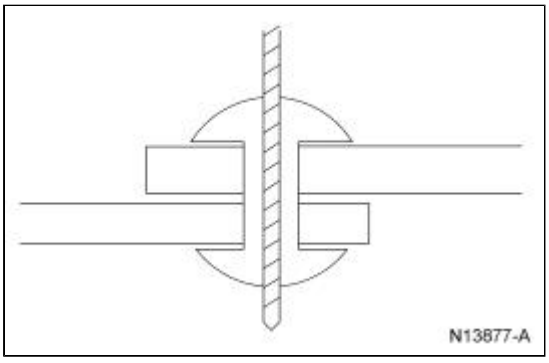


Frame Rivets

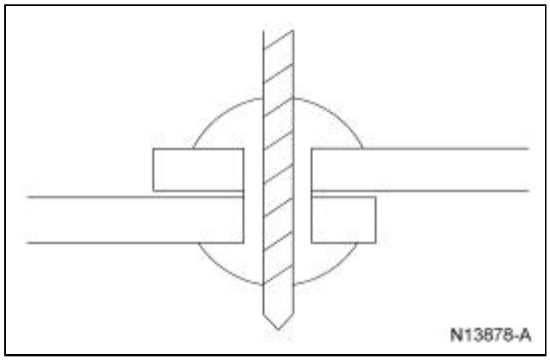
Printable View (114 KB)

Rivet Removal

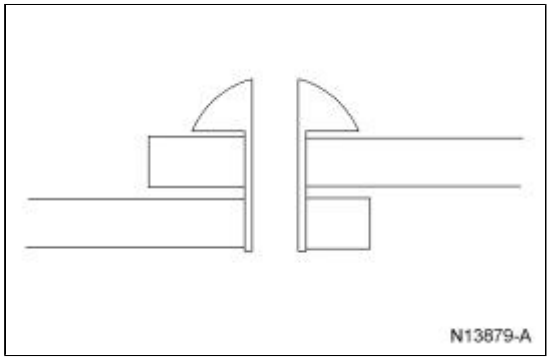
CAUTION: Do not drill outside the rivet into the frame as that will weaken the frame.



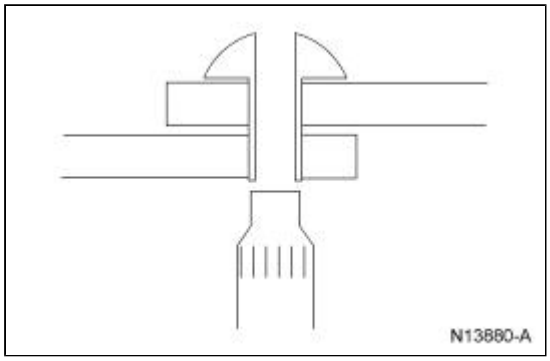
1. Drill a 3.20 mm (1/8 in) pilot hole through the center of the rivet.
2. Drill a 8.5 mm (11/32 in) hole through the pilot hole.



3. Remove the rivet head using an air chisel.



4. Drive out the rivet with a punch.



5. Remove the support.

Replacing Rivets with Bolts

CAUTION: Drill only where a rivet was removed. Drilling outside the rivet hole will weaken the frame.

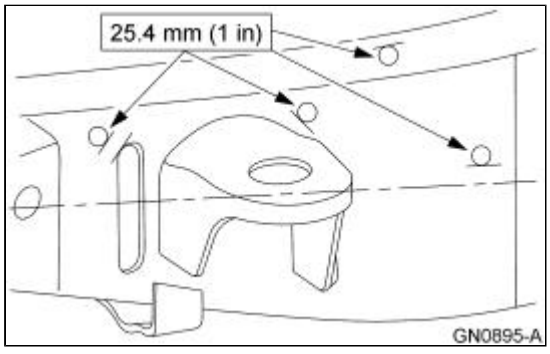
1. Line drill a hole the size of the bolt through the old rivet hole. Example: for a 11.11 mm (7/16 in) diameter rivet, use a 12.7 mm (1/2 in) drill bit.

2. Position the support.

3. Replace the rivets that were removed with the next larger size bolts. Insert the bolts, nuts and washer that are Property Class 9.8 metric (Grade 8) in the drilled holes.

Drilling Precautions

1. Observe the following precautions when carrying out drilling operations.
   - The hole is at least the specified distance from the edge of the nearest hole.
   - The edge of the drilled hole is at least the specified distance from the edge of the flange.
   - The hole is at least the specified distance above the frame centerline.
   - The drilled hole is at least the specified distance from any other existing bracket or component of the frame.



Frame Repairs

Printable View (84 KB)

Material

Item	Specification
Low Temperature Anti-Corrosion Coating PM-12-A	—

Welding Precautions

NOTE: Whenever factory E-coat has been removed by sanding, grinding or weld burn-off, the coating must be restored.

1. If welding must be done on a frame, make sure the following requirements are met:
   - If the frame is attached to the vehicle, the battery ground cable must be disconnected before using any electrical welding equipment. For additional information, refer to Section 414-00 .
   - Do not use gas welding equipment.
   - Use a temperature-indicating crayon to make sure that the temperature does not exceed 750°C (1,400°F).
   - Install new spot-welded components by spot welding where possible. If spot welding is not possible, use puddle welding.

Frame Straightening

WARNING: Straightening of front frame rail convolute is prohibited. Failure to follow these instructions may result in personal injury.

CAUTION: Straightening of severely bent or kinked frame components is prohibited. However, before removing these components, restore dimensionally to a pre-collision condition.

NOTE: Whenever factory E-coat has been removed by sanding, grinding or weld burn-off, corrosion protection must be restored.

1. If heat is needed to straighten a frame member, keep the temperature below 650°C (1,200°F) (a dull red glow). A temperature sensitive thermal melt crayon should be used to monitor heat buildup.
   - Heat should be kept to a minimum area so that the hardness of the metal will not be affected.
   - Straightening should only be attempted on frames that fail to meet specifications, or where damage is apparent. For additional information, refer to Body in this section.
   - Straightening should be limited to parts which are not severely bent.
   - Reposition or shield any fuel lines, brake lines or wiring harnesses or components in heated area.

Underbody Misalignment Check

NOTE: Underbody misalignment can be the result of damage or loose frame components. It can affect front and rear wheel alignment and cause incorrect operation and abnormal wear of tires and chassis parts.

NOTE: For additional information, refer to Body in this section, for dimensional data when carrying out repairs on the frame.

1. Inspect the frame for damage and loose parts before checking the frame alignment.
    - Inspect all cross members for cracks, twists or bends.
    - Inspect all of the welded connections for cracks.
    - Check all of the support brackets for looseness.

Frame Reinforcement

Printable View (95 KB)

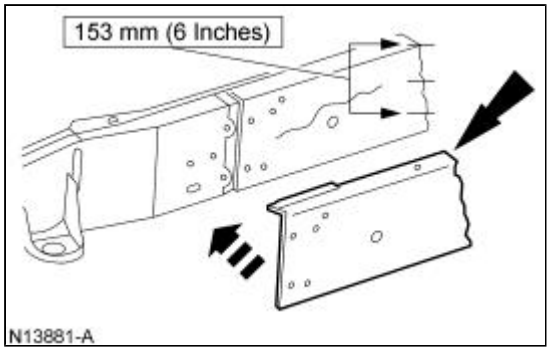
Material

Item	Specification
Low Temperature Anti-Corrosion Coating PM-12-A	—

NOTE: The frame must be straightened before any reinforcing can be started.

NOTE: Whenever factory E-coat has been removed by sanding, grinding or weld burn-off, the Anti-Corrosion coating must be restored.

1. After a bent frame member has been straightened, inspect the frame member closely for cracks. If any cracks show, the frame member should be reinforced or replaced. Reinforcements should be made from angle or flat stock of the same material and thickness as the frame member being reinforced, and should extend to either side of the crack. Ideally, the reinforcement should be cut from the corresponding area of a similar frame.



2. Use a wire brush on the area around the crack to remove the paint, wax, grease or mud, etc., and expose the crack completely, this will make sure of good penetration.

3. To stop the crack from spreading, drill a 6.35 mm (1/4 in) hole at a point 12.5 mm (1/2 in) beyond the root of the crack.

4. Grind out the full length of the crack to the hole to form a V-shaped slot with the base of the V-slot contacting the reinforcement.

5. The base of the V-slot should have at least a 1.5 mm (0.06 in) opening to make sure of weld penetration to the reinforcement when welding the crack.

6. **NOTE:** Be sure to weld the V-slot first, then metal finish the area, before installation of the reinforcement.

   Drill clearance holes in the reinforcements to clear rivet heads or nuts where necessary.

7. In the event that a repair is required on more than one frame surface (for example, a flange crack that extends into the web), 2 pieces of flat stock should be welded together where they join. The web reinforcement should be a minimum of 76.2 mm (3.0 in) high and have a 63.5 mm (2.54 in) radius at each of the 2 corners.

8. Completely clean the surface of the frame under and around the reinforcements.

9. Clamp the reinforcements securely to the frame prior to welding. Continuously weld the reinforcement over the welded V-slot repair.

10. Grind the flange edge weld until smooth after all pit holes have been filled by the weld.

11. If a damaged bracket is to be replaced, make sure the new bolts, washers and nuts are of the same specifications and bolt torque as the original parts.

Sectioning Guidelines

Special Tool(s)

ST2956-A	Pro 230 MIG Welder 208-00030
ST2738-A	Heat Treatment Induction Resistance Spot Welder 254-00001

Material

Item	Specification
Metal Bonding Adhesive TA-1	—
Motorcraft Metal Surface Prep ZC-31	—
Metal Patch Panel Adhesive TA-3	—
Seam Sealer TA-2	—
Structural Foam Kit TA-12	WSS-M99P35-A

WARNING: On vehicles equipped with safety canopy options, the safety canopy module and related components must be removed prior to carrying out any section repairs near the roof line or sail panel areas of the vehicle. For additional information, refer to Section 501-20B .

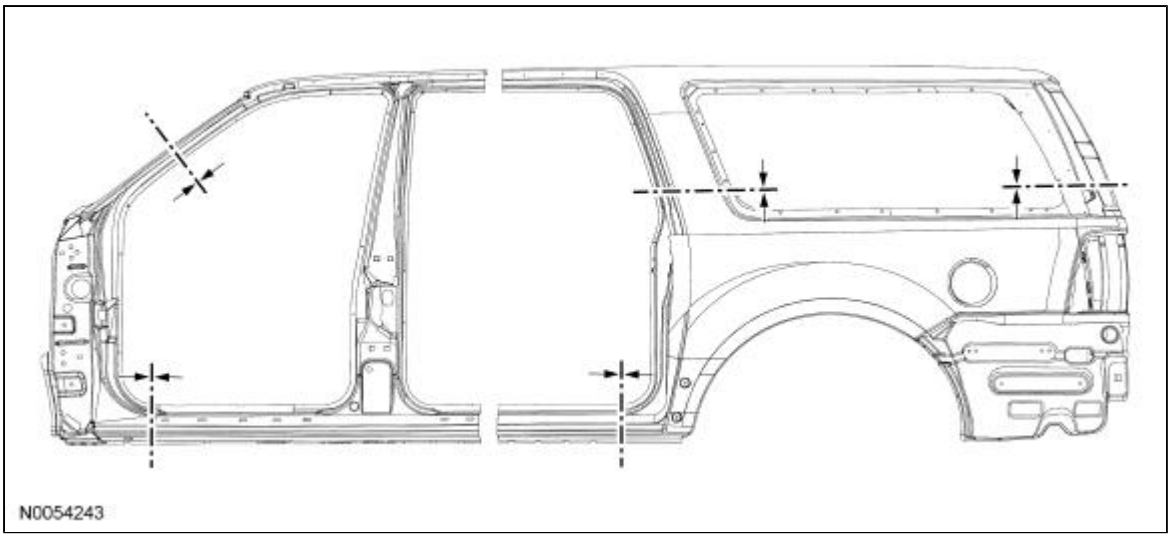
CAUTION: Body side section repairs should not be carried out in areas of laser welds, door hinge or striker anchoring points or near restraints anchoring points. Do not cut or grind body side components within 50 mm (1.96 in) of restraint anchoring points. For additional restraints anchoring location information, refer to Section 501-20A . Cut points shown in illustrations are approximate.

NOTE: Factory spot welds may be substituted with either resistance spot welds or MIG plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.

NOTE: Observe prescribed welding procedures when carrying out any body side section repair. For additional information, refer to Welding Precautions — Steel in this section.

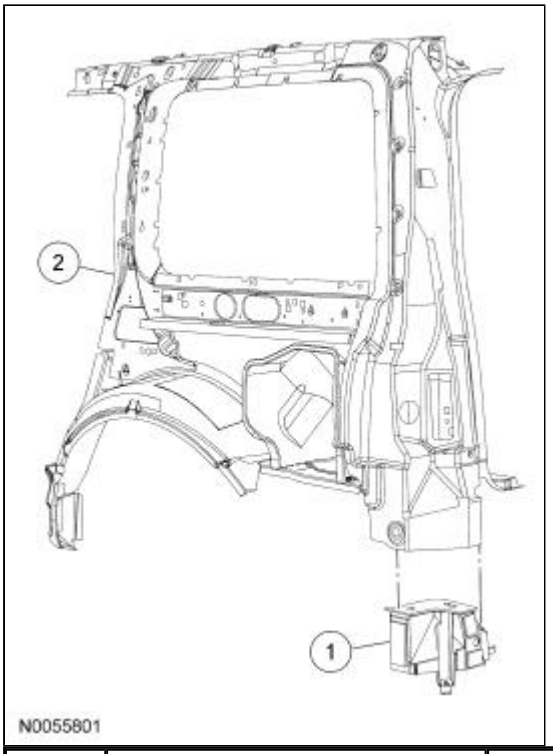
NOTE: Left side shown, right side similar.

NOTE: Illustration cut-lines are approximate. Illustration is intended as a guideline.



Structural Foam Insert Location

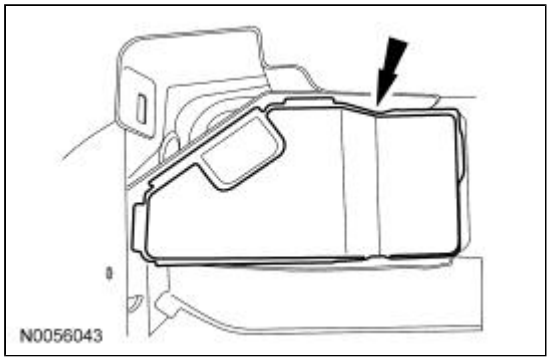
NOTE: Structural foam and a nylon carrier are contained in the lower D-pillar area, RH and LH side. The nylon carrier is located between the D-pillar inner and outer panel. When repairing, not replacing body sheet metal and the structural foam parts appear to be damaged, you must full-fill the area. This will encase reinforcement parts or cracked foam in place and eliminate potential rattles. When carrying out a full-fill application, up to 13 structural foam cartridges may be required to completely fill the cavity depending on the level of damage, etc. to the area. When installing a new nylon carrier only, 3 structural foam cartridges are required. This procedure should be carried out after sheet metal work has been completed and before final painting of the vehicle.



Item	Part Number	Description
1	41017 LH/ 41016 RH	Nylon carrier
2	27865 LH/ 27864 RH	Bodyside inner panel

1. Use duct or masking tape to close in the open bottom of the nylon carrier.
    - Insert and push the nylon carrier upward from the bottom of the vehicle to lock in the space between the D-pillar inner and outer panel.

2. Install and weld in the sheet metal stuffer plate below the nylon carrier.



3. Insert one 140 mm (5.51 in) x 100 mm (3.93 in) x 75 mm (2.95 in) soft foam block into the No. 4 body mount area (oval hole inside the liftgate area). The front edge of the block should be outboard toward the D-pillar. The block will prevent foam expansion into the body mount.

4. Apply aluminum duct tape to cover all holes on the inside of the body and under side of the body in the repair area.

5. Prepare the structural foam cartridges for application by warming with a heat gun or similar method to obtain a working temperature of 46°C (115°F) to 74°C (165°F). This will allow for easier foam flow from the cartridges. A pneumatic or manual application gun can be used.

6. Dispense the foam into the lower D-pillar through the large rectangular hole in the tail light opening.
    - Allow the foam to cure for 15 minutes and remove the aluminum tape as necessary.

7. **NOTE:** When it is necessary to carry out weld-bonding procedures, refer to Weld-Bonding in this section.

    Corrosion protection needs to be restored whenever it is necessary to sand or grind through painted surfaces or E-coat, or when bare metal repairs are carried out. For additional information, refer to Restoring Corrosion Protection Following Repair in this section.

Restoring Corrosion Protection Following Repair

Printable View (80 KB)

Material

Item	Specification
Low Temperature Anti-Corrosion Coating PM-12-A	—
Motorcraft Metal Surface Cleaner ZC-21	WSE-M5B392-A
Motorcraft Metal Surface Prep ZC-31	—
Roof Ditch Sealer TA-15	—
Metal Bonding Adhesive TA-1	—
Metal Patch Panel Adhesive TA-3	—

NOTE: Corrosion protection needs to be restored whenever it is necessary to sand or grind through painted surfaces or E-coat, or when bare metal repairs are made.

NOTE: Avoid applying corrosion protection to mechanical and electrical parts, electric motors, speakers, door locks and drain holes.

1. The surfaces must be free of oil, dirt and other foreign material.
    1. Thoroughly clean and degrease metal surfaces using a good wax and grease remover.
    2. Adhesion will be improved by lightly abrading the surface.
    3. Apply anti-corrosion coating with a brush (natural hair brush only) or roller.
    4. The material may also be applied through spraying.
        - Shake the product until all particles are suspended.
        - Filter the material into a spray gun cup and dilute up to 10% with water.
        - Apply the material using a basecoat/clearcoat spray gun equipped with a 1.4 mm (0.05 in) tip.
        - Allow the material to flash dry to remove water and let air dry, or bake at 60°C (140° F) for 45 minutes.
    5. Apply at 2.5 MIL film thickness.
    6. Anti-corrosion products will reach full-bond strength within 48 hours at 21°C (70°F) and 60% relative humidity.

2. **NOTE:** Make sure the corrosion protection material is fully cured before attempting to prime or paint the surface(s).

   When welding overlapping surfaces or substrates, apply corrosion protection between the surfaces prior to welding. When the surfaces have been welded, apply corrosion protection to the exterior surfaces or substrates.

3. When treating exposed seams, apply the appropriate seam sealer, following product guidelines. Prime and paint as required.

Refinishing — Environmental Damage

Printable View (82 KB)

Material

Item	Specification
Motorcraft Detail Wash ZC-3-A	—
Motorcraft Acid Neutralizer ZC-1-A	—
Motorcraft Alkaline Neutralizer ZC-2-A	—

Iron Oxide (Rail Dust) or Acid Rain Decontamination

NOTE: Iron oxide contamination appears as tiny rust spots on horizontal surfaces and in severe cases can be felt. This damage is typically caused from rail shipment, storage near railroad tracks or fallout from industrial manufacturing facilities.

NOTE: Acid rain contamination can be identified as water spotting and in severe cases staining within the water spots.

1. **CAUTION: Never paint over iron particles. Use only the recommended decontamination procedure detailed below.**

   Rinse any dust, dirt and foreign material from the vehicle body with cold water. Flush liberally.

2. Prepare the acid neutralizer by mixing 8 parts of water to 1 part neutralizer in a bucket.

3. **CAUTION: Do not allow the product to dry on the vehicle.**

   NOTE: Use a separate wash mitt for each product applied to the vehicle.

   Working quickly and beginning at the top of the vehicle and working to the sides, apply the acid neutralizer mix to the entire vehicle. Keep the vehicle wet with the solution and lightly agitate for 5 to 7 minutes. Continue around the vehicle 4 to 5 times. For severe conditions, work the product for up to 8 minutes.

4. Rinse the vehicle completely with cold water to remove the product.

5. Dry only the horizontal surfaces of the vehicle, do not dry the glass at this time.

6. **CAUTION: Do not apply the alkaline neutralizer directly to the vehicle plastic trim.**

   NOTE: Use a separate wash mitt for each product applied to the vehicle.

   NOTE: Alkaline neutralizer is a ready to use product. Do not mix with water.

   Pour the alkaline neutralizer into a squirt bottle and apply the solution to a clean wash mitt.

7. **CAUTION: Do not allow the alkaline neutralizer to dry on the vehicle.**

   Apply the product to the vehicle keeping the solution wet and lightly agitate for 5 to 7 minutes. For severe conditions, work the product for up to 8 minutes.

8. Rinse the vehicle completely with cold water to remove the product.

9. Prepare the detail wash by mixing 29.5 ml (1 ounce) with 3.78L (1 gallon) of water.

10. Using a clean wash mitt, shampoo the entire vehicle and rinse with cold water. Dry the vehicle completely.

11. Visually inspect the paint surface for any remaining evidence of ferrous metal particles. Repeat procedure as necessary.

Surface Finishing Following Decontamination

1. **CAUTION: When attempting to affect a repair by buffing, polishing or color sanding, do not remove an excess of 0.3 MIL of paint film or refinishing will be required.**

   NOTE: Acid rain discoloring or etching may require color sanding in addition to buffing and polishing. In extreme cases, refinishing may be required if the following procedure does not restore the vehicle finish.

   NOTE: Do not intermix buffing products. Use only one manufacturer's product.

   NOTE: Always follow the manufacturer's product usage sequence. Use the appropriate buffing or polishing pad at the recommended buffing speed as specified by the product manufacturer.

   Apply rubbing compound to the vehicle surface as recommended by the product manufacturer.

2. Apply machine glaze to the vehicle surface as recommended by the product manufacturer.

3. Use an alcohol and water mixture (1 to 1) to clean the buffed and polished areas. Verify removal of scratches and swirls before the application of the final polish.

4. Apply a final polish material by hand, with a dual-action sander and foam pad, or with an orbital polisher and appropriate polishing bonnet.

5. Wash and dry the vehicle.

Refinishing — Manufacturing Damage

Printable View (80 KB)

Material

Item	Specification
Low Temperature Anti-Corrosion Coating PM-12-A	—
Motorcraft Detail Wash ZC-3-A	—

WARNING: The correct protective equipment and clothing must be worn when using paints, solvents, sanding or grinding. Proper ventilation must also be provided to avoid harmful fumes in the work area.

CAUTION: Protect adjacent areas/substrates when preparing for and during refinishing.

NOTE: Peeling/delamination concerns can be described as lack of adhesion, either between the substrate and topcoats or between individual coats of paint.

1. Wash the repair area with pH-neutral soap and water.
2. Remove any trim, emblems and hardware from the area to be repaired.
3. **NOTE:** All delamination must be removed.

   Sand or media blast the damaged surface, keeping the repair area as minimal as possible.
4. Treat any bare metal surface to prevent flash corrosion, and prime and block sand as necessary prior to refinishing.
5. Mask the adjacent panels to protect from overspray.
6. Spot repair the base coat as necessary, following the paint manufacturer's prescribed procedures.
7. Following the paint manufacturer's prescribed procedure, apply clear coat to the entire panel.

Weld-Bonding — Squeeze-Type Resistance Spot Welding (STRSW) Method

NOTE: Ford Motor Company does not approve or recognize structural repair procedures using anything but genuine Ford parts.

Structural repairs (frames, rails, aprons and body panels) carried out using other than Ford Motor Company parts have not been tested. In addition, structural equivalence and corrosion protection cannot be assured.

Returning a vehicle to pre-accident condition can only be assured if repair procedures are carried out by skilled technicians using genuine Ford Motor Company parts and approved methods.

Structural component repair procedures approved by Ford using genuine parts have been validated through testing by Ford Motor Company engineers. Should alternative structural component repair procedures and/or parts be used, repairers should be aware of the potential liability they incur.

NOTE: Corrosion protection needs to be restored whenever it is necessary to grind through painted surfaces or E-coat, or when bare metal repairs are made. For additional information, refer to Restoring Corrosion Protection Following Repair in this section.

NOTE: Door shells are manufactured with structural adhesives only, weld bonding door skins is not recommended. Only metal bonding adhesive should be used.

NOTE: Weld-bonding is a method used to join metals using squeeze-type resistance spot welding (STRSW) or metal inert gas welding (MIG) and structural adhesive. The steps listed in this procedure apply to both types of welding. STRSW is the preferred method. MIG welding should only be used when areas to be welded cannot be accessed using STRSW-type machinery.

NOTE: Factory spot welds should be substituted with either resistance spot welds or MIG plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.

1. Verify the vehicle is dimensionally correct on a frame machine. Straighten if necessary.

2. Remove damaged panels with an air saw or air chisel. Remove only large portions of the damaged panel. Avoid cutting into mating flanges or adjacent parts.

3. Drill out the spot welds using an appropriate spot-weld cutter and remove the remaining portions of the panel to be replaced.

4. Prepare any damaged flanges on the vehicle using hammer and dolly.

5. Grind the mating surface of the original flanges not greater than 25 mm (0.98 in) where the metal bonding adhesive will be applied.
   - Be sure to remove galvanizing on metal. Metal should have a shiny appearance.
   - Be careful not to damage the corners or thin the metal. The E-coat should also be removed on the opposite side of the flange only where the spot welds are to be placed.

6. Bevel any edges to less than 10 degrees on the new panel where a finished section joint is needed.

7. Dry-fit and clamp the replacement service parts to verify a correct fit.
   - Remove the service part after verifying correct fit and alignment.

8. If MIG welding, refer to Weld-Bonding — MIG Welding Method in this section.

9. **NOTE:** The ends of welding clamps should be insulated on the ends using tape or similar material when welding is carried out.

   Follow manufacturer's prescribed welding procedures and settings. For additional information, refer to Welding Precautions — Steel in this section.

10. Prepare the adhesive. Dispense a small amount of metal bonding adhesive from the cartridge to make sure of an even flow of both components. Attach the mixing tip and dispense a mixing tip length of adhesive to make sure of a correct mix ratio.

11. **NOTE:** Working time of the adhesive is 40-50 minutes at 21°C (70°F). For every -7°C (20°F) above 21°C (70°F), decrease the working time by one half. For every -7°C (20°F) below 21°C (70°F), double the working and cure time.

    Create a test sample.
    1. Prepare the metal and adhesive as described. Apply a 6-9 mm (0.23-0.35 in) bead of adhesive and weld the sample.
    2. Place the welded sample in a vice and perform destructive weld tests by peeling the scrap metal apart using large channel lock-type pliers. Measure the weld nugget to determine that the nugget meets Ford weld nugget requirements.
    3. When the correct weld nugget is achieved, the service part can be weld-bonded.

Weld Nugget Chart

Test Thickness of Metal (in millimeters)	Nugget Size (mm)
0.7 + 0.7	4.30
0.7 + 0.7 + 0.7	4.30
0.9 + 0.9	4.70
0.9 + 0.9 + 0.9	4.70
1.0 + 1.0	5.20
1.0 + 1.0 + 1.0	5.20
2.0 + 2.0	7.10

2.0 + 2.0 + 2.0	7.10
3.0 + 3.0	8.70
3.0 + 3.0 + 3.0	8.70
3.0 + 0.7	4.30
0.7 + 3.0 + 1.0	5.20
2.0 + 2.0 + 0.7	4.30
0.9 + 0.9 + 2.0	4.70
2.0 + 0.9 + 1.0	5.20
1.0 + 3.0 + 1.0	5.20
3.0 + 1.0 + 2.0	7.10
0.9 + 0.7 + 0.9	4.30

12. Apply a 6-9 mm (0.23-0.35 in) bead of metal bonding adhesive to the vehicle prepared flange surface.

13. Place the service part(s) in the correct position on the vehicle.
    - When positioned do not pull the component away from the vehicle. If repositioning is necessary, slide the service part(s). This will make sure of correct contact between the components and adhesive.

14. Clamp evenly and tightly. The adhesive contains glass beads which will prevent over-clamping the component.

15. **NOTE:** Welding can be carried out anytime during the adhesive curing process, or after the adhesive is fully cured. Welder settings will vary when welding through wet adhesive versus welding through fully cured adhesive. Refer to welder manufacturer's recommended settings for welding through fully cured adhesive. It is recommended to place a shunt weld in an area with no adhesive to make sure of conductivity, particularly when welding through fully cured adhesive.

    NOTE: If welding will not be carried out immediately, allow a minimum of 1.5 to 2 hours of adhesive cure time at 21°C (70°F) before removing clamps. Cure time at lower temperatures should be increased. Clamps may be removed immediately after the component is welded.

    Wipe excess adhesive from the panel before it cures.

16. Finish any cosmetic section seams with fiber-filled body filler. Rough sand the filler, after the adhesive cures, apply conventional body filler and block-sand the area.

17. Prime any bare metal areas with anti-corrosion coating. Apply 2-3 coats allowing it to flash dry between coats.

18. Use seam sealer wherever a cosmetic seam sealer is required.

19. Mix and apply primer surfacer per manufacturer's recommendations.

20. Mix and apply basecoat per manufacturer's recommendations.

21. Mix and apply clearcoat per manufacturer's recommendations. Refinishing materials may be force-dried following paint manufacturer's recommendations.

Weld-Bonding — MIG Welding Method

NOTE: Metal inert gas (MIG) weld-bonding can be substituted as an alternative to squeeze type resistance spot welding (STRSW). It may only be used to weld areas that are inaccessible to STRSW machinery. However when accessible STRSW is the preferred method.

NOTE: Corrosion protection needs to be restored whenever it is necessary to grind through painted surfaces or E-coat, or when bare metal repairs are made. For additional information, refer to Restoring Corrosion Protection Following Repair in this section.

NOTE: Door shells are manufactured with structural adhesives only, weld-bonding door skins is not recommended. Only metal bonding adhesive should be used.

NOTE: Factory spot welds should be substituted with either resistance spot welds or MIG plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.

1. Remove damaged panels with an air saw or air chisel. Remove only large portions of the damaged panel. Avoid cutting into mating flanges or adjacent parts.
    - Drill out the spot welds using an appropriate spot-weld cutter and remove the remaining portions of the panel to be replaced.

2. After removing the damaged sheet metal panel(s), repair any damaged flanges on the vehicle using hammer and dolly.

3. Using an appropriate grinder, carefully grind around the entire receiving flange area following the original welds. Be sure to remove all E-coat, paint or galvanized coating from the mating surfaces of the joint.
    - Do not grind above the mating surface area to prevent the possibility of corrosion forming later.

4. Repeat the procedure from Step 3 on the mating surface of the replacement service part(s).

5. Prepare the new service panel for plug welds.
    - Using the original panel as a reference, drill or punch holes in the exact number as the original spot welds. The holes should be positioned as close as possible to the original spot weld locations, without lining up exactly on top of an original spot weld site.
    - To make sure of correct weld performance, grind the immediate perimeter of plug weld hole. Grind only in the area of the plug weld, this will keep corrosion to a minimum.

6. Dry-fit and clamp the replacement service parts to verify a correct fit and alignment.
    - Remove the service part after verifying correct fit and alignment.

7. The vehicle prepared flange areas where plug welds will be located must be kept free of adhesive. Apply 25 mm (0.98 in) tape to the plug weld areas to prevent contamination from the adhesive.

8. Prepare the adhesive. Dispense a small amount of metal bonding adhesive from the cartridge to make sure of an even flow of both components. Attach the mixing tip and dispense a mixing tip length of adhesive to make sure of correct mix ratio.

9. **NOTE:** Work time of the adhesive is 40-50 minutes at 21°C (70°F). For every -7°C (20°F) above 21°C (70°F), decrease the working time by one half. For every -7°C (20°F) below 21°C (70°F), double the working and cure time.

    Apply a 6-9 mm (0.23-0.35 in) bead of adhesive to the vehicle prepared flange surface. Remove the tape from the plug weld areas.

10. Place the service part(s) in the correct position on the vehicle.
    - When positioned, do not pull the component away from the vehicle. If repositioning is necessary, slide the service part(s). This will make sure of correct contact between the

components and adhesive.

11. Clamp evenly and tightly. The adhesive contains glass beads which will prevent over-clamping the component.

12. **NOTE:** Welding can be carried out anytime during the adhesive curing process, or after the adhesive is fully cured.

    NOTE: If welding will not be carried out immediately, allow a minimum of 1.5 to 2 hours of adhesive cure time at 21°C (70°F) before removing clamps. Cure time at lower temperatures should be increased. Clamps may be removed immediately after the component is welded.

    Wipe excess adhesive from the panel before it cures.

13. Finish any cosmetic section seams with fiber-filled body filler. Rough sand the filler, apply conventional body filler after the adhesive cures and block-sand the area.

14. Prime any bare metal areas with anti-corrosion coating. Apply 2-3 coats allowing it to flash dry between coats.

15. Use seam sealer wherever a cosmetic seam sealer is required.

16. Mix and apply primer surfacer per manufacturer's recommendations.

17. Mix and apply basecoat per manufacturer's recommendations.

18. Mix and apply clearcoat per manufacturer's recommendations. Refinishing materials may be force-dried following paint manufacturer's recommendations.

Plastics Identification

Printable View (80 KB)

NOTE: Identification of the various plastic types is necessary to select the appropriate repair methods to make high quality plastic repairs. Plastics can generally be broken down into 2 categories, thermoplastics and thermosetting plastics. Thermoplastics can be remolded by heating. This makes plastic welding a possible repair alternative.

1. **NOTE:** In some instances a code or material designation is stamped indicating what type of plastic it is.

   Thermoplastics are solvent reactive. Types of thermoplastics include thermoplastic polyolefin (TPO) polyvinyl chloride (PVC) and acrylonitrile butadiene styrene (ABS). Polyolefins have an oily or waxy appearance. Examples include some bumper covers, stone shields, fender aprons and fan shrouds. Polyolefins require an adhesion promoter prior to carrying out any refinish procedure.
   - To determine if the part is a polyolefin, grind the damaged area in an out-of-sight area. Grinding a polyolefin will melt and smear the plastic and leave a ragged edge. If the part is non-polyolefin, the area will grind or sand smoothly, producing a powdery dust.

2. Olefin plastic can also be identified by placing a small sliver in container of water, if the sample floats it is an olefin plastic. A non-olefin will sink when placed in a container of water.

3. Thermosetting plastics are insoluble and infusible and are made with 2-part thermosetting resins. When mixed together, heat is generated, producing a cure that is irreversible. Because of this thermosetting plastics will require the use of a two-part adhesive for repair. Generally, thermosetting plastics are rigid or semi-rigid. sheet-molded compounds (SMC) are reinforced with glass and other fibers and are strong and rigid. SMC is used for large panels such as hoods, liftgates, fenders and quarter panels.
   - A burn test can be a reliable method to determine if a plastic is a thermosetting plastic. Extreme care must be exercised when using this method.
     - Apply an open flame to the corner of the damaged component. If the material crystallizes and becomes hard it is a thermosetting plastic.

Plastics Refinishing — Exterior

Printable View (82 KB)

Material

Item	Specification
Motorcraft Adhesion Promoter PM-19A316-AA	—
Plastic Bonding Adhesive TA-9	—

1. **NOTE:** Care must be used if applying heat to parts, thermoplastics soften and tend to loose their shape when heated.

   The first step to any repair or refinish procedure is to identify the type of plastic. Is it rigid or flexible, grained or smooth? This will determine how it should be cleaned and prepared for refinishing. Refer to Plastics Identification in this section.
   - It is essential that the correct cleaner is used, depending on which painting system is employed, solvent based or water based.
   - Clean part with warm water/mild detergent and gray scuff pad, then with plastic cleaner to remove wax, silicone and other contaminants. As a general rule, if water beads on the part it requires additional cleaning as all the manufacturing release agent has not been removed.

2. New parts may require baking in a spray booth or heating with heat lamps to release trapped solvents or mold release agents used during manufacture.

3. After cleaning, lightly sand with 600-grit or finer sandpaper. Clean sanding residue with plastic cleaner and wipe clean.

4. A sealer may be required to prevent wrinkling and lifting of the topcoat prior to carrying out the refinish procedure.

5. Flexible and non-flexible components should be refinished separately as a flex additive is generally added to the paint material when refinishing flexible plastics.

6. It is recommended to carry out the refinish process with component installed on-vehicle to control color and blending of the adjacent panels.

7. Apply adhesion promoter. For best results, use only when product and surface temperatures are between 15°C (60°F) and 33°C (92°F). In cases of high humidity, apply the adhesion promoter in a spray booth or controlled climate. You may also use a hair dryer or fan to create air movement to speed the adhesion promoter curing process.
   - Shake can vigorously for one full minute before use and repeat for 10 seconds after each full minute of use.
   - Test spray on a hidden area before proceeding.

8. Hold can 150 mm (5.9 in) to 254 mm (10 in) from the surface and spray a full wet coat with a steady back and forth motion. Be sure all areas of the surface are covered. Observe for a uniform gloss/coverage across the surface while the adhesion promoter is still wet.

9. Allow the adhesion promoter to dry 2-3 minutes and reapply a second wet coat. Allow to dry 2-3 minutes.

10. Proceed with the refinish process and follow the Ford-approved paint system procedures. Steps may vary between paint manufacturers.

Plastic Bonding Adhesive TA-9	—
Motorcraft Adhesion Promoter PM-19A316-AA	—
Motorcraft Interior Spray Paint PM-19M547-XXXXH (XXXX=Color Code)	—

1. **CAUTION: Do not attempt any refinishing procedure on supplemental restraint system (SRS) deployment doors or covers.**

   CAUTION: The use of adhesion promoter is only required for rigid plastics. Do not use adhesion promoter or equivalent prior to color coating soft plastic.

   NOTE: Care must be used if applying heat to parts, thermoplastics soften and tend to loose their shape when heated.

   The first step to any repair or refinish procedure is to identify the type of plastic. Is it rigid or flexible, grained or smooth? This will determine how it should be cleaned and prepared for refinishing. Refer to Plastics Identification in this section.
   - Clean part with warm water/mild detergent and gray scuff pad, then with plastic cleaner to remove wax, silicone and other contaminants.

2. **NOTE:** As with most refinishing procedures, surface preparation is critical to a correct repair. Surfaces must be clean, dry and free of contaminants that could cause loss of adhesion. A test sample should be painted prior to refinishing the repair or replacement part for correct color match.

   Use interior trim spray paint only when the product and surface temperatures are 15°C to 33°C (60°F to 92°F). Blushing may occur in high humidity conditions, to alleviate this apply paint in a spray booth or controlled climate. You may also use a hair dryer or fan to create air movement to speed the paint curing process.
   - Shake can vigorously for 2 full minutes prior to use.
   - Apply to a small inconspicuous area to verify color match.

3. **NOTE:** If applying refinish materials to components on the vehicle, mask off adjacent areas to protect from overspray.

   Hold can vertically 305 mm (12 in) from surface to be painted. Apply in light mist coats using even strokes from side to side. Stop spraying at the end of strokes.

4. Apply 2 to 3 mist coats, allowing approximately 10 minutes between coats. Heavy coats will result in patchiness and runs and may trap solvents, resulting in incorrect curing.

Adhesion Promoter

NOTE: Correct surface preparation must be carried out before any adhesion promoter or paint product is applied. Thoroughly clean surface to be coated. Remove any grease, dirt, polish, moisture, etc. with a plastics wax and grease remover by wiping in one direction, To make sure of correct adhesion, it is essential that all silicone, conditioners and existing paint be removed prior to application. If applying refinish materials to components on the vehicle, mask off adjacent areas to protect from overspray.

1. For best results, use only when the product and surface temperatures are between 15°C and 33° C (60°F to 92°F). In cases of high humidity apply the adhesion promoter in a spray booth or controlled climate. You may also use a hair dryer or fan to create air movement to speed the adhesion promoter curing process.

2. Shake can vigorously for one full minute before use and repeat for 10 seconds after each full minute of use.
    - Test spray on a hidden area before proceeding.

3. Hold can 150 mm (5.9 in) to 254 mm (10 in) from the surface and spray a full wet coat with a steady back and forth motion. Be sure all areas of the surface are covered. Observe for a uniform gloss/coverage across the surface while the adhesion promoter is still wet.

4. Allow the adhesion promoter to dry 2-3 minutes and reapply a second wet coat. Allow to dry 2-3 minutes.

5. Apply the color coat as soon as possible after second coat of adhesion promoter dries, within 10 minutes if possible.

Plastics Repair

Printable View (118 KB)

Material

Item	Specification
Plastic Bonding Adhesive TA-9	—
Motorcraft Adhesion Promoter PM-19A316-AA	—

1. In deciding whether to repair or install a new component, follow these guidelines.
   - Is a part readily available?
   - Can the damaged part be economically returned to its original strength and appearance, or will the labor cost exceed the cost of a new component?
   - Will repair provide for the fastest, highest quality repair?

2. **CAUTION: Never apply solvents such as lacquer thinner or reducer at any stage of plastic repair. Solvents, cleaners and water are absorbed by many types of plastics and by the glass fibers used for reinforcements. If this occurs the plastic may swell in the area of repair and cause the repair to fail. Remove cleaners and water quickly and use air and heat to speed up drying.**

   CAUTION: During the repair of most plastics and particularly polyolefins, an adhesion promoter must be applied to the substrate to allow repair materials and paint to bond correctly. Reapplication is required every time you grind or sand through the sealer or primered layers.

   NOTE: When possible, it is recommended to carry out as much of the plastic repair as possible on the vehicle. Parts mounted on the vehicle are held in correct alignment throughout the repair. Attempting to repair the part off the vehicle may cause misalignment. This could lead to failure of the repair.

   Select the correct repair method by identifying the type of plastic being repaired. Refer to Plastics Identification in this section to determine the type of plastic being repaired.

3. **NOTE:** Always refer to the manufacturer's label directions for the type repair materials, fillers and bonding agents being used as they are material specific.

   Determine whether a reinforcement piece is needed as a backer on large repairs.
   - Construct a reinforcement piece from a scrap piece of the type of plastic being repaired and follow manufacturer's label directions for the type of system being used.
   - When repairing sheet-molded compound (SMC), a reinforcement piece can be constructed using several layers of glass cloth saturated with resin or structural adhesive. Nylon screening is also acceptable. The weave of the cloth or screening should be loose enough to allow the resin to thoroughly penetrate. Reinforcement should cover the entire area of damage and extend outward beyond the damage or joint area.

SMC Body Panel Repair

NOTE: The following procedure applies to repair of structural cracks and large gouges, if damage is

cosmetic use of reinforcing cloth may not be necessary.

1. Panels to be repaired should be dry and at room temperature 18°C (65°F) to 24°C (75°F) prior to carrying out any repairs. Both sides of the panel must be thoroughly cleaned before sanding or grinding.

2. Cover the break in the SMC (front and back) with masking tape. This protects the damaged area from absorbing the prep cleaner and eliminates wicking of the cleaner through the fibers into the SMC.

3. Remove all waxes, silicones, dirt and road oils from the area surrounding both sides of the damaged area with a plastics wax and grease remover.
    - Remove the tape and sand the back of the repair area with an angle grinder, dual action (D/A) sander or by hand using 80-grit sandpaper. Remove all dust with vacuum and tack cloth.

4. Create a reinforcing patch using a piece of scrap SMC that conforms well to the back of the damaged area or form a patch from fiberglass cloth.
    - Cut a section of cloth large enough to cover the repair, plus 25.4 mm (1 in) around the repair area.
    - Cut a section of plastic film backing approximately 25.4 mm (1 in) larger than the cloth. Lay the plastic on a smooth, flat surface where it will be used to create a pyramid patch.

5. Follow manufacturer's directions and apply plastic repair adhesive to the plastic film backing and smooth with plastic spreader to recommended thickness. Place the pre-cut fiberglass cloth on the adhesive-coated plastic film. Cover the cloth with a coat of repair adhesive and spread to the recommended thickness.

6. Apply the prepared patch to the backside of the panel and compress. Follow manufacturer's instructions for adhesive cure. Remove plastic film after adhesive cures and sand as necessary to remove roughness.

7. Remove masking tape from the front side of damaged area and grind down to the backing patch. Use an angle grinder with a 30- to 40-grit wheel. Make a gradual taper in the area, this will prevent bull's-eyes or read-through in the finished repair. Sand prepared area with a dual-action (D/A) sander or hand-sand with 80-grit sandpaper.

8. Build a pyramid patch using fiberglass cloth or equivalent and plastic repair adhesive. Following manufacturer's directions, apply patch to damaged area.

9. Rough-grind area to remove excess adhesive. Sand repair area with 80-grit sandpaper, making sure to cut slightly below the SMC finished surface. This will allow for a finish coat of plastic body repair material.

10. Apply a finish coat of plastic repair filler material per manufacturer's directions.

11. Finish-sand, prime and topcoat using Ford-approved paint systems.

Thermoplastic Compounds

1. In deciding whether to repair or install a new component follow these guidelines.
    - Is a part readily available?
    - Can the damaged part be economically returned to its original strength and appearance, or will the labor cost exceed the cost of a new component?
    - Will repair provide for the fastest, highest quality repair?

2. Identify the plastic compound. Refer to Plastics Identification in this section.

3. **NOTE:** The following steps are to be used as a guideline. Depending on what brand of adhesives,

patch material etc., are used, procedures may vary slightly.

Thoroughly clean the damaged area with wax and grease remover.

4. Hand sand the repair area with 80-grit sandpaper and remove any foreign material with compressed air.

5. Apply a plastics adhesion promoter per label directions to the repair area.

6. For small repairs, a plastic adhesive filler can be applied to damaged area. Follow manufacturer's directions and build layers to form a thickness above the damaged area. This will allow area to be sanded smooth.

7. To repair large holes or cracks, measure and cut a piece of fiberglass cloth or equivalent 25.4 mm (1 in) larger than crack or hole.
    - Apply plastic repair adhesive to damaged area and immediately apply into plastic adhesive for reinforcement. Apply additional plastic repair adhesive for strength and shape as required.

8. Contour and shape the repair as necessary with D/A sander. Avoid sanding through the repair.

9. Finish-sand the area and carry out any required paint operations using Ford-approved paint systems.

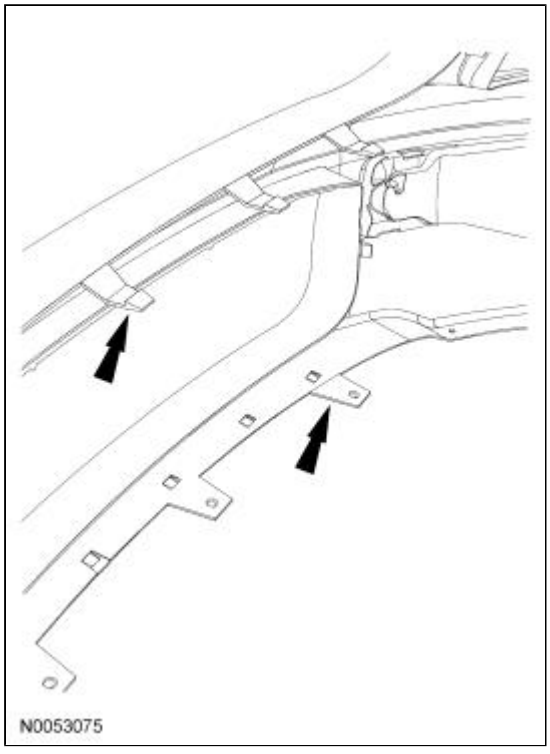
Tab Repair — Bumper

1. **NOTE:** Inspect the bumper cover to determine if part can be repaired to an acceptable level of quality of appearance, fit and durability. Will labor and material cost of the repair meet or exceed the cost of a new replacement bumper cover. If the bumper cover is determined to be repairable, proceed to the following steps.

   NOTE: The following steps are to be used as a guideline. Depending on what brand of adhesives, patch material etc., are used, procedures may vary slightly.

   Remove the affected bumper. Refer to Section 501-19 .

2. Clean the broken tab(s) with a plastics wax and grease remover.



3. Hand sand the repair area with 80-grit sandpaper and remove any foreign material with compressed air.

4. Apply a plastics adhesion promoter per label directions to the repair area.

5. Measure and cut a patch of fiberglass cloth or equivalent large enough to form the front of the tab, then slope back in a wedge shape approximately 51 mm (2 in) from original tab.

6. Prepare the repair adhesive per manufacturer's instructions and apply to the affected area.
    - Immediately apply the plastic repair material to form the tab shape.

7. Allow appropriate cure time and shape the repair tab using a small angle sander. Use extreme care to not sand through the exterior surface.

8. Perform any required paint repair operations to the bumper cover using Ford-approved paint systems.

9. Reassemble and install the bumper cover. Refer to Section 501-19 .

Frame Members

Material

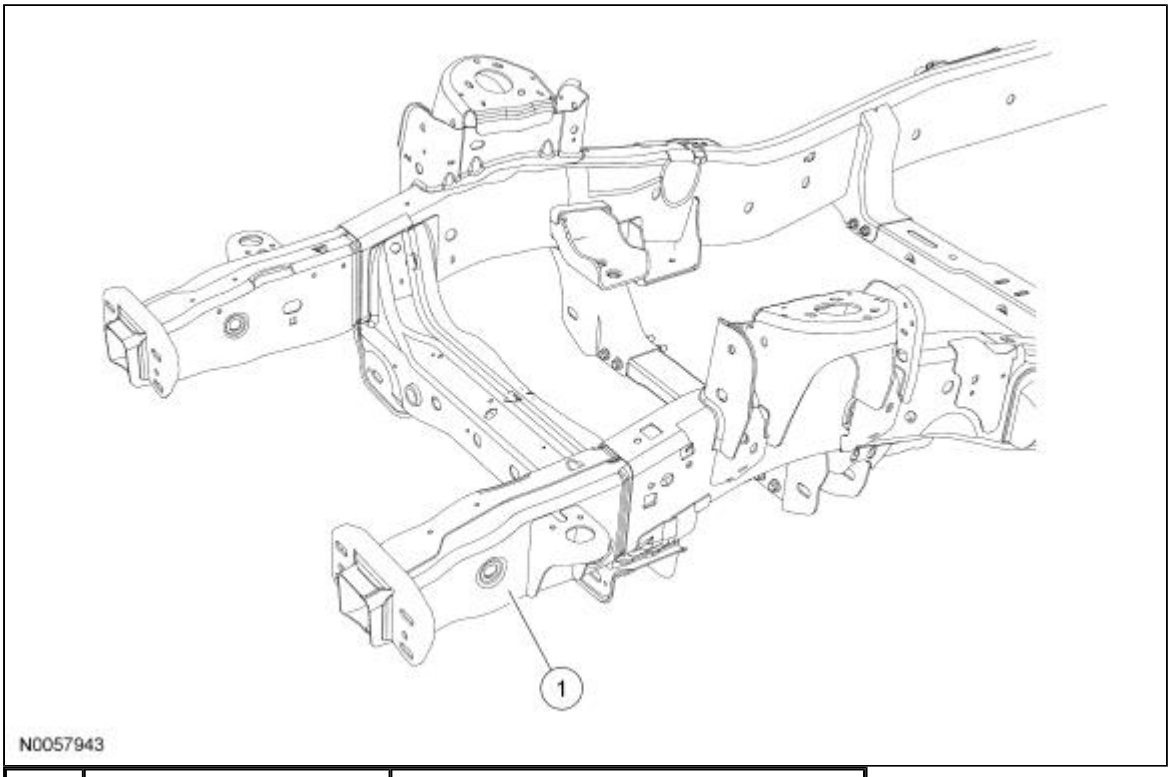
Item	Specification
Motorcraft Metal Surface Cleaner ZC-21	WSE-M5B392-A
Motorcraft Metal Surface Prep ZC-31	—
Low Temperature Anti-Corrosion Coating PM-12-A	—
High Temperature Anti-Corrosion Coating PM-13-A	—

Front Frame Rail

CAUTION: The following is step by step procedure for carrying out front frame horn replacement on 2007 and beyond Expedition/Navigator models. Then Expedition/Navigator is a body on frame vehicle which is designed with energy absorbing features in the front frame horns to manage crash energy. The horn section of the frame MUST NOT be straightened if any holes or surfaces show evidence of collapse or buckling. If any evidence of damage exists BEHIND the first frame crossmember in terms of buckling, cracking, etc. then the ENTIRE frame must be installed new.

NOTE: Prior to beginning this procedure, the vehicle must be restored to its correct overall dimensions. Refer to Body in this section for dimensional information.

NOTE: The replacement front frame horns are production parts designed with a taper to insert into the mid-rail section to assist in alignment and welding operations. Tow hooks are not included with the replacement frame kit.



Item	Part Number	Description
1	5D059 LH/ 5D058 RH	Frame rail sectioning/instruction kit

NOTE: Corrosion protection needs to be restored whenever it is necessary to sand or grind through painted surfaces or E-coat, or when bare metal repairs are made. For additional information, refer to Restoring Corrosion Protection Following Repair in this section.

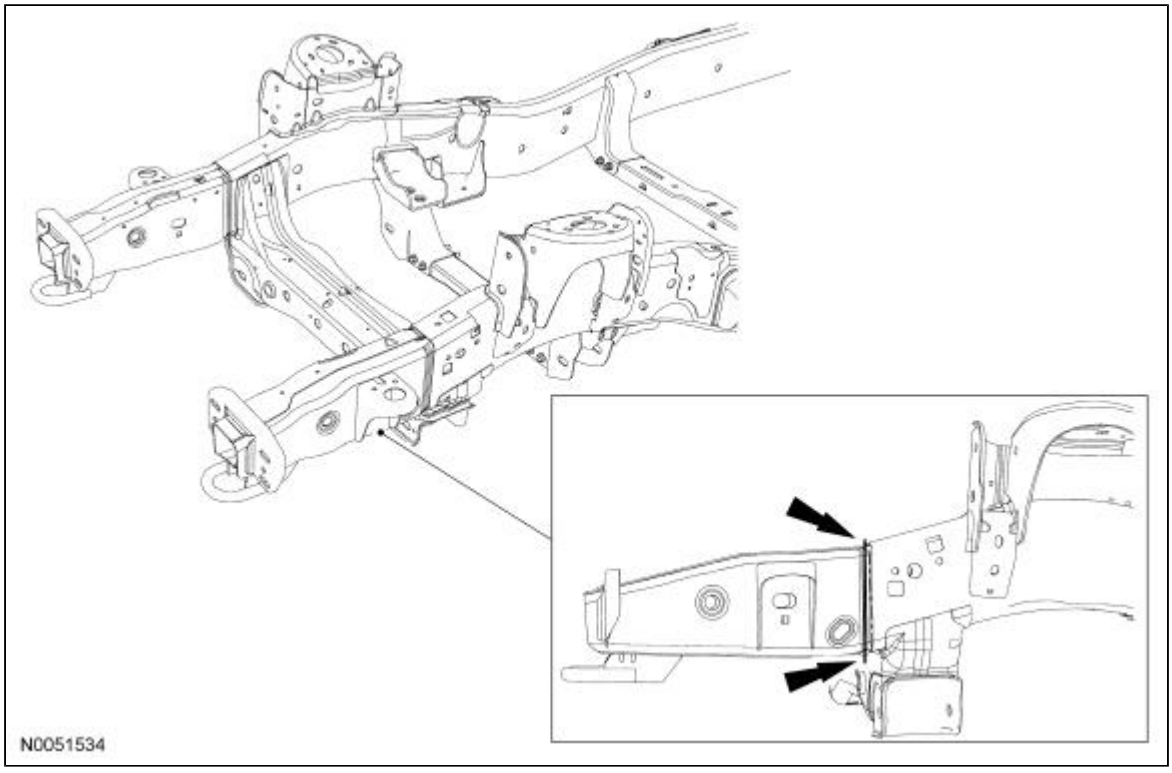
NOTE: Observe prescribed welding procedures when carrying out repairs to the frame assembly. For additional information, refer to Welding Precautions — Steel in this section.

1. Position the vehicle on a frame rack following the manufacturer's recommendations. Measure the vehicle to determine body and frame alignment. Refer to Body in this section for dimensional information.

2. Remove the front bumper. For additional information, refer to Section 501-19 .
   - If equipped, remove tow hooks.

3. Unbolt the front end sheet metal and body mount bolts. If necessary, raise the body off the frame assembly. Refer to Section 502-02 .

4. Locate the vertical weld line of the front frame horn to center mid-rail.



5. **CAUTION: DO NOT cut directly along the weld line. Leave enough material on the forward side of the weld line to allow the edge to be ground back exactly to the weld line. This is required to assure a proper fit up between the frame and the replacement section.**

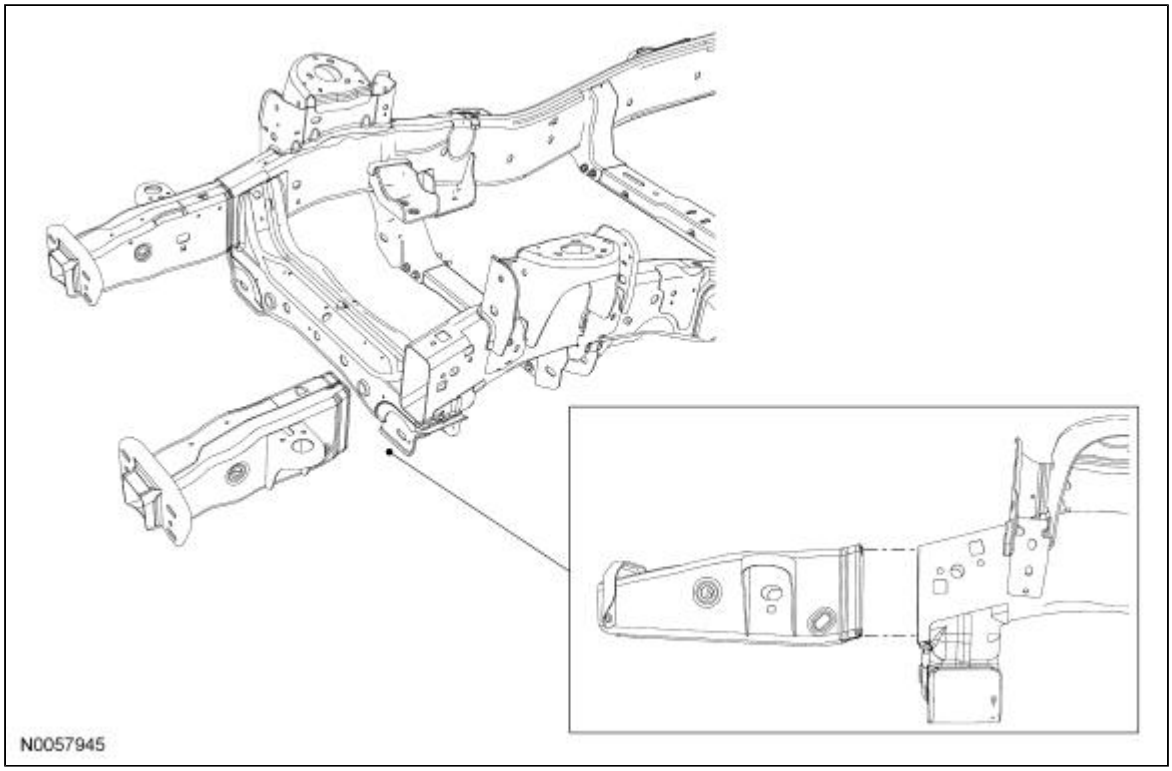
   Using a plasma cutter, reciprocating saw or die-grinder, remove the damaged front frame horn section.

6. **CAUTION: Do not thin out the frame rail. The material must maintain a minimum thickness of 3.4 mm (0.13 in) after grinding. This is required to maintain correct energy management in the event of a collision.**

   Grind off the excess welding material that remains in front of the weld line on the frame mid-rail.

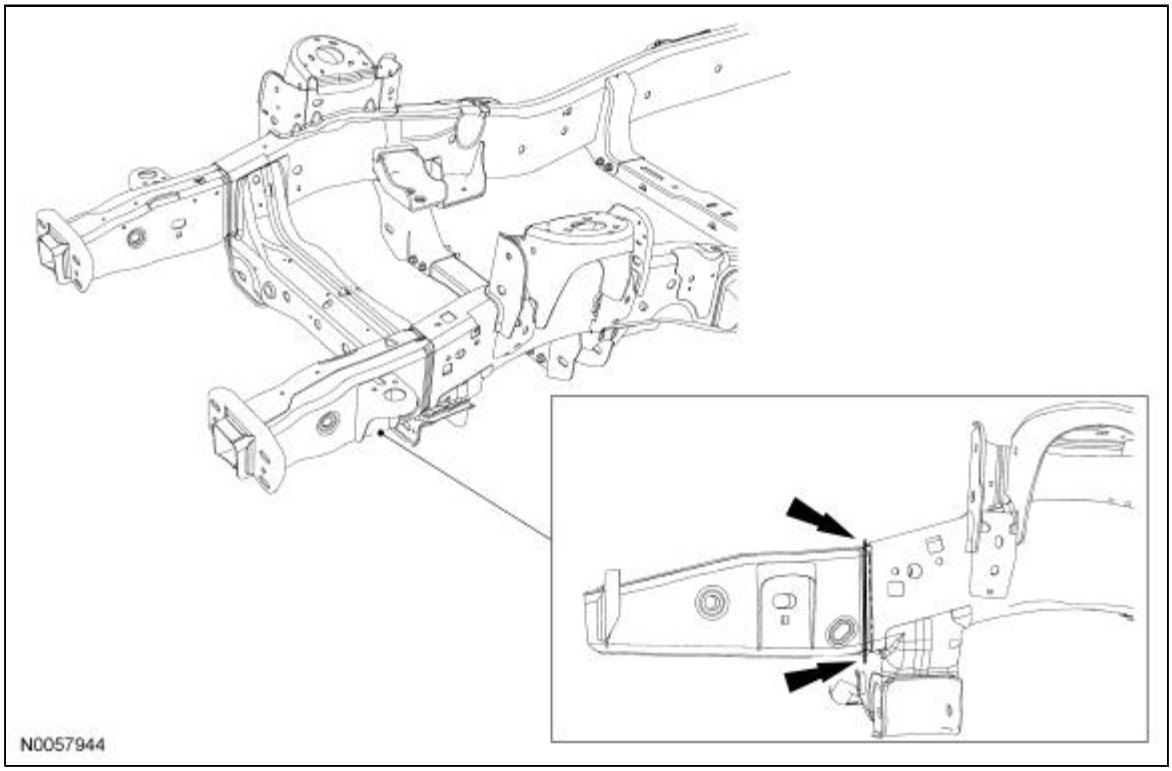
7. Remove the remaining portion of the front frame horn (ring-like piece) from inside the mid-rail with pliers or similar tool.

8. Using a wire brush or sandpaper, remove the E-coat 15 mm (0.59 in) to 20 mm (0.78 in) wide from the inner and outer surfaces of the existing mid-rail. Clean the surfaces with a wire brush and metal surface cleaner.
   - Apply a zinc rich weld-through primer to the exposed inner and outer mating surfaces.



9. Using a wire brush or sandpaper, remove the E-coat 15 mm (0.59 in) to 20 mm (0.78 in) wide from the inner and outer surfaces of the replacement frame horn section. Clean the surfaces with a wire brush and metal surface cleaner.
    - Apply a zinc rich weld-through primer to the exposed inner and outer mating surfaces.

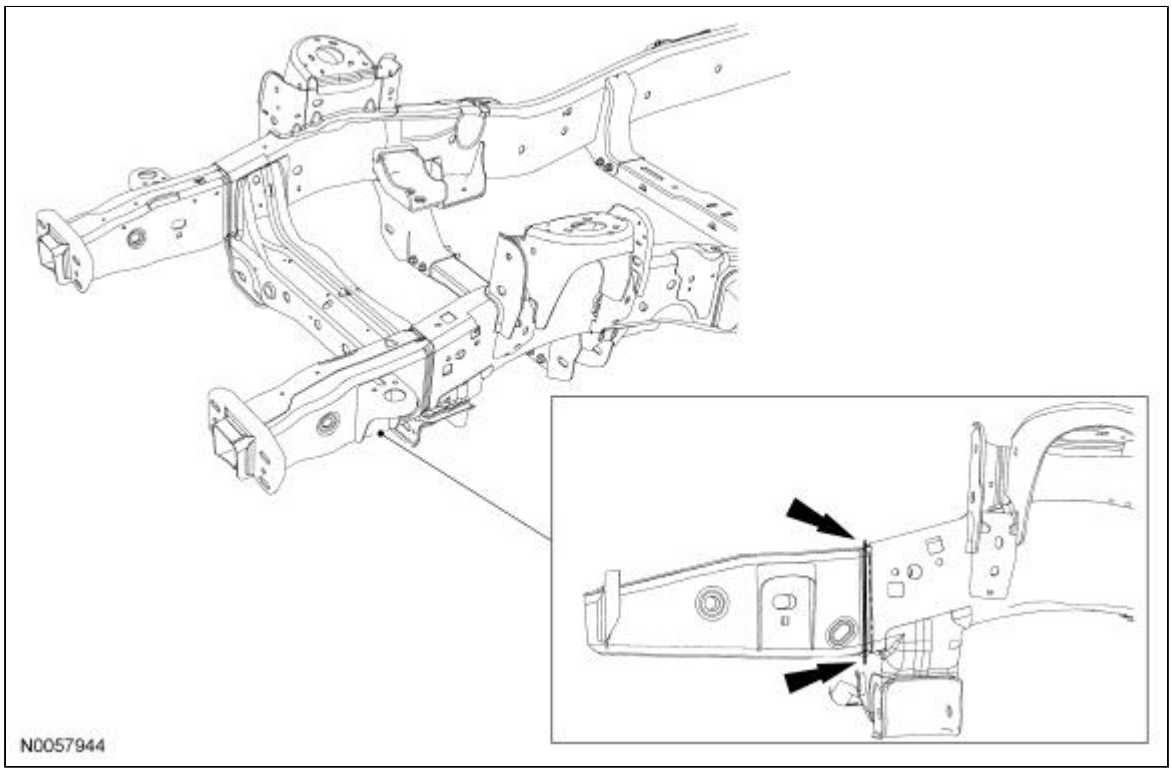
10. Install the front section inside the frame mid-rail. Support the replacement frame horn in position. Verify that the front end sheet metal (FESM) mount bracket lines up with sheet metal hole. The holes should line up so that the FESM mount can be replaced and the FESM mount bolt can be installed.



11. Make sure that the frame and service replacement part have attained a minimum room temperature of 10°C (50°F) before beginning the weld procedure. A MIG welder capable of producing 185-250 amps must be used. Use ER70S-3 or ER70S-6 weld wire 0.035 to 0.045 inch diameter that is compatible with SAE 1010 steel. Shielding gas must be 100% CO2 or 75% CO2 and 25% Argon.

12. Tack weld the frame horn replacement section into the existing frame at 4 small points centered on the flats between the corners. This will hold the section in place to check the fit up prior to completely welding up the section.
    - Measure the frame to make sure factory dimensions are maintained.

13. Make sure the frame section replacement is correctly aligned.
    - Carry out the remainder of the welding procedure.
    - After welding is complete, grind off any excess weld material.



14. Use a dye penetrant to determine if any cracks or large voids exist in the weld joint after the welding process has been completed.
    - If any cracks or other defects exist, grind out the defect and repair it until the imperfection is corrected.

15. Clean the repaired area(s) and any exposed metal surfaces. Restore corrosion protection to the exposed surfaces of the repaired area(s) using anti-corrosion coating PM-12-A or PM-13-A on exposed interior and exterior surfaces.

16. Install the components removed during the repair procedure and torque fasteners to correct specification.

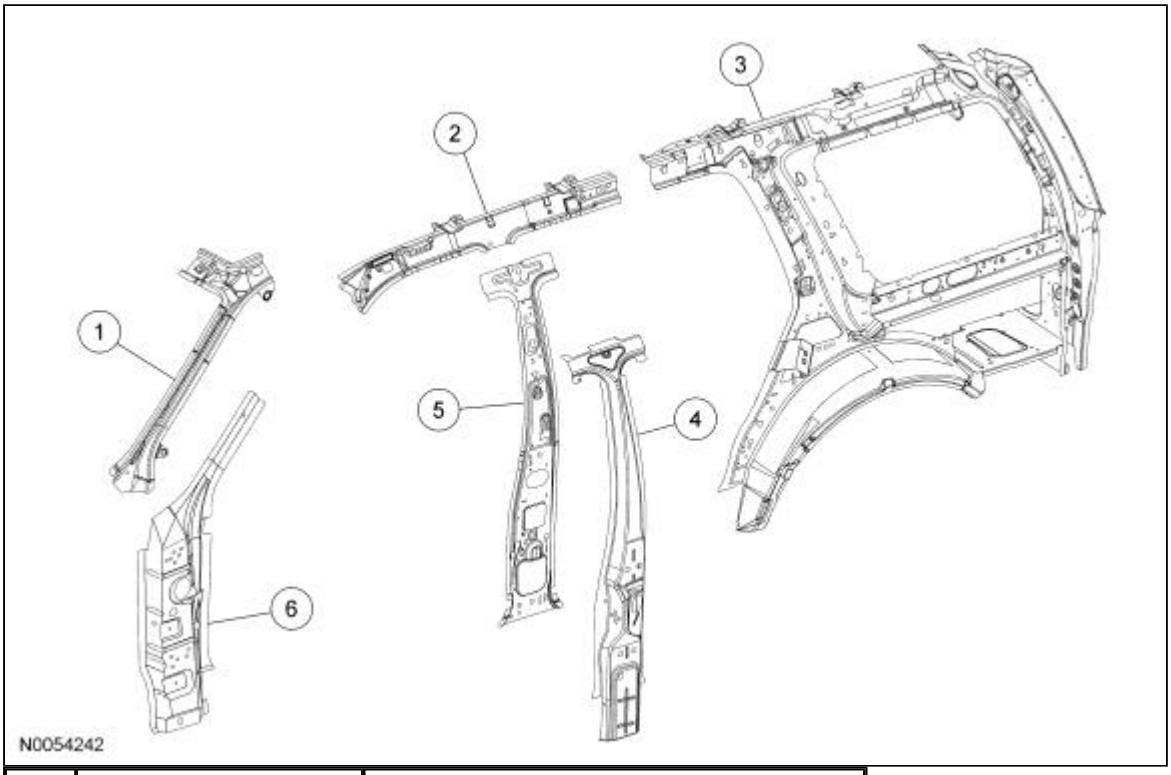
WARNING: On vehicles equipped with safety canopy options, the safety canopy module and related components must be removed prior to carrying out any section repairs near the roof line or sail panel areas of the vehicle. For additional information, refer to Section 501-20B .

CAUTION: Body side section repairs should not be carried out in areas of laser welds, door hinge or striker anchoring points or near restraints anchoring points. Do not cut or grind body side components within 50 mm (1.96 in) of restraint anchoring points. For additional restraints anchoring location information, refer to Section 501-20A .

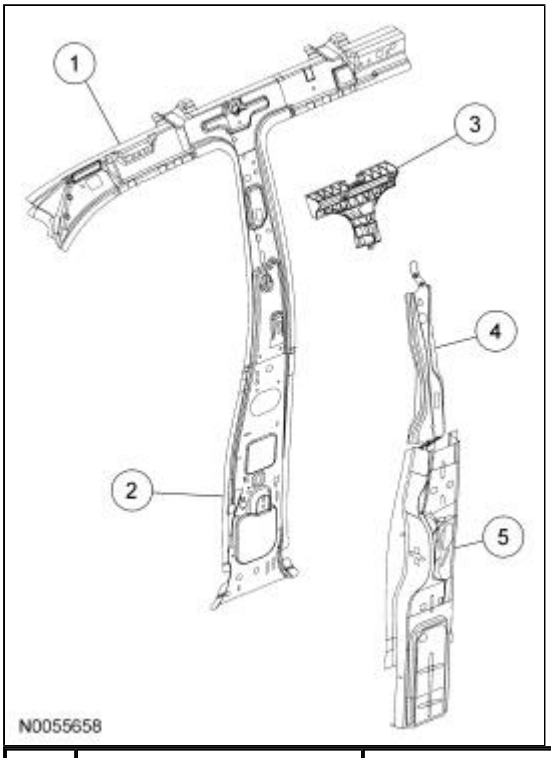
NOTE: A nylon epoxy reinforcement part No. 24383 LH/ 24382 RH, is contained in the upper B-pillar reinforcement in the 2007 design. Reinforcement is not used in 2007.5 design. The following illustration shows the 2007.5 design.



Item	Part Number	Description
1	02501 LH/ 02500 RH	A-pillar upper reinforcement — mild steel
2	513A31 LH/ 513A30 RH	Roof side rail assembly — mild steel
3	27865 LH/ 27864 RH	Body side inner panel — mild steel
4	27841 LH/ 27840 RH	B-pillar reinforcement — high-strength steel
5	24301 LH/ 24300 RH	B-pillar inner — high-strength steel
6	22843 LH/ 22842 RH	A-pillar reinforcement — mild steel

B-Pillar Inner — 2007 Design

NOTE: All 2007 models contain a nylon epoxy reinforcement (No. 3), in the upper B-pillar. Lincoln Navigator and Expedition/Navigator extended wheelbase models contain an additional reinforcement, (No. 4). Expedition standard wheelbase does not use this reinforcement (No. 4), in the B-pillar.



Item	Part Number	Description
1	513A31 LH/ 513A30 RH	Roof side rail assembly — mild steel
2	24301 LH/ 24300 RH	B-pillar inner — high-strength steel
3	24383 LH/ 24382 RH	Reinforcement — nylon/epoxy
4	24587 LH/ 24586 RH	B-pillar reinforcement — high-strength steel
5	27841 LH/ 27840 RH	B-pillar reinforcement — mild steel

NOTE: Corrosion protection needs to be restored whenever it is necessary to sand or grind through painted surfaces or E-coat, or when bare metal repairs are carried out. For additional information, refer to Restoring Corrosion Protection Following Repair in this section.

NOTE: Factory spot welds may be substituted with either resistance spot welds or MIG plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.

Observe prescribed welding procedures when carrying out any body side section repair. For additional information, refer to Welding Precautions — Steel in this section.

NOTE: When necessary to carry out weld-bonding procedures, refer to Weld-Bonding in this section.

1. Remove the outer body sheet metal from the affected area prior to carrying out any reinforcing panel replacement. For additional information, refer to Sectioning Guidelines in this section.

Frame and Body Mounting

Printable View (428 KB)

The frame is made up of 2 steel boxed side rails and crossmembers, which are welded to the 2 side rails. The transmission crossmember is bolted to the side rails. The side welded rails and crossmembers are not replaced separately.

The service kits available for the frame are the following:

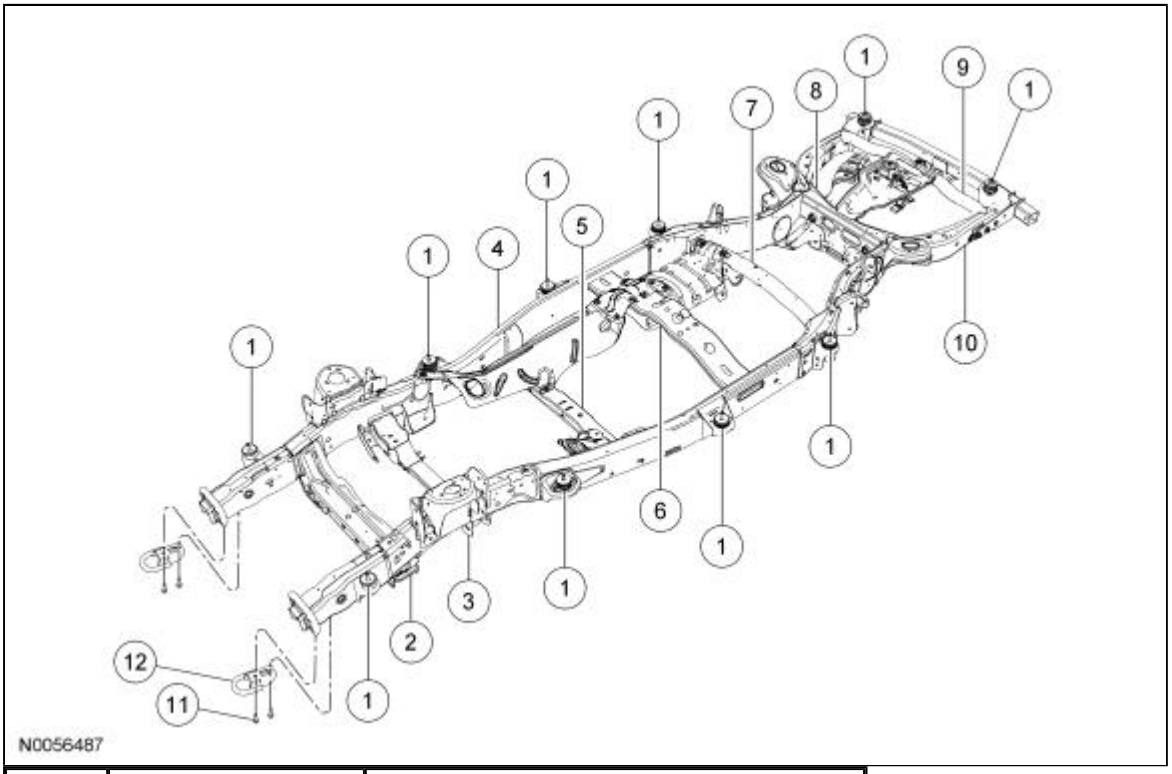
- RH front horn replacement kit
- LH front horn replacement kit
- Front bumper bracket replacement kit
- 1B crossmember replacement kit
- Transmission crossmember replacement kit

Refer to the instructions included in the kits for installation instructions.

Frame Mounted Heat Shields

All frame mounted heat shields, except the spare tire heat shield, are tightened to 20 Nm (15 lb-ft). The spare tire heat shield is tightened to 25 Nm (18 lb-ft).

Frame Components



Item	Part Number	Description

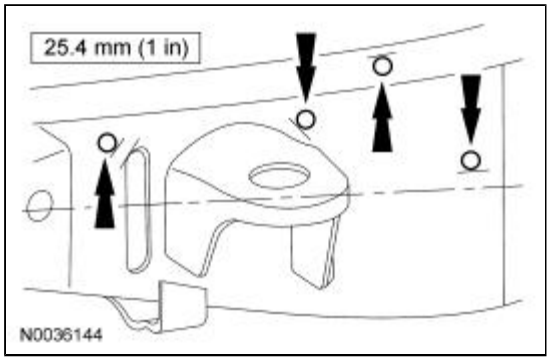
Drilling Precautions

Printable View (78 KB)

1. If a hole must be drilled in the frame, make sure the hole meets the following requirements:
   - The hole is at least the specified distance from the edge of the nearest hole.
   - The edge of the drilled hole is at least the specified distance from the edge of the flange.
   - The drilled hole is at least the specified distance from any other existing bracket or component of the frame.



Welding Precautions

Printable View (63 KB)

1. If welding must be done on a frame, make sure the following requirements are met:
    - If the frame is attached to the vehicle, the battery ground cable must be disconnected before using any electrical welding equipment. For additional information, refer to Section 414-01 .
    - Do not use gas welding equipment.
    - Use a temperature-indicating crayon to make sure that the temperature does not exceed 750°C (1,400°F).
    - Install new spot-welded components by spot welding where possible. If spot welding is not possible, use puddle welding.

Frame Straightening

Printable View (79 KB)

1. **WARNING: Straightening of front frame rail convolute is prohibited. Failure to follow these instructions may result in personal injury.**

   When straightening the frame, make sure the following requirements are met:

   - **CAUTION: Reposition and/or shield any fuel lines, brake lines or wiring harness or component in the heated area.**

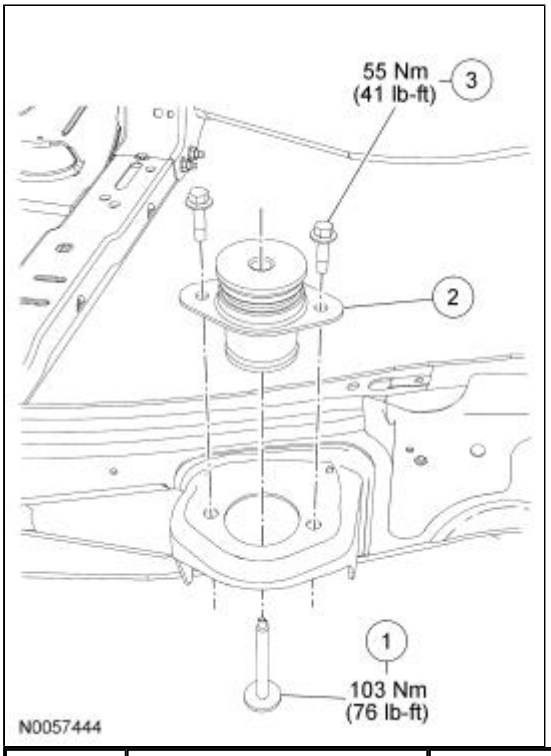
     If heat is needed to straighten a frame member, keep the temperature below 650°C (1,200°F) (a dull red glow). A temperature sensitive thermal melt crayon should be used to monitor heat buildup.
   - Heat should be kept to a minimum area so that the hardness of the metal will not be affected.
   - Straightening should only be attempted on frames that fail to meet specifications of the diagonal checking method or where damage is apparent.
   - Straightening should be limited to parts which are not severely bent.
   - Reposition and/or shield any fuel lines, brake lines or wiring harnesses or components in heated area.

Body Support — Number 1

Printable View (121 KB)

Removal and Installation

No. 1 Body Support Mount



Item	Part Number	Description
1	78001B39	Body mount bolt
2	7800192	Body support mount
3	W506433	Bolt (2 required)

1. Remove the body mount bolt.
   - To install, tighten to 103 Nm (76 lb-ft).

2. Loosen the remaining body mount bolts.

3. Raise the vehicle body enough to remove the body mount bolts and body mount.
   - To install, tighten to 55 Nm (41 lb-ft).

4. **NOTE:** No lubricants of any kind are to be used during body mount installation.

   NOTE: Do not reuse body mount fasteners. New fasteners must be installed for each fastener that has been removed or loosened.

   To install, reverse the removal procedure.

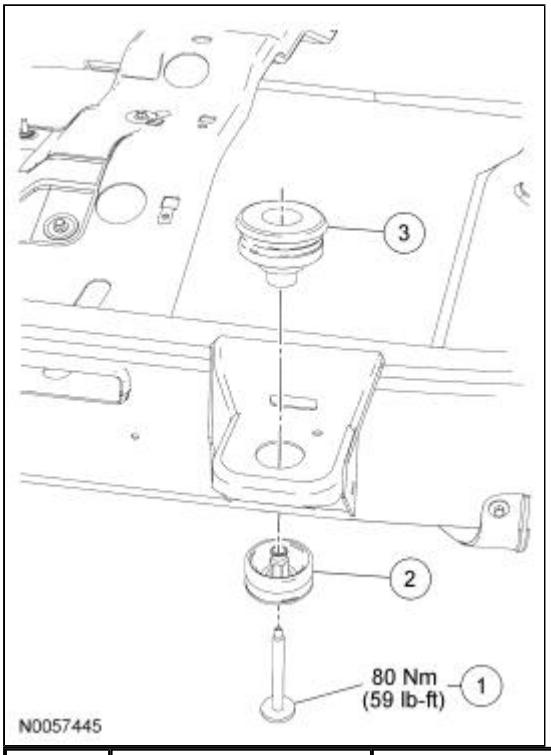
Body Support — Number 2 and Number 3

Printable View (115 KB)

Removal and Installation

No. 2 Body Support Mount

NOTE: No. 2 body mount is shown, body mount No. 3 similar.



Item	Part Number	Description
1	78001B39	Body support mount bolt
2	7800193	Lower body support mount
3	7800192	Upper body support mount

Upper and lower body support mount

1. Remove the body mount bolt and lower body mount.
    - To install, tighten to 80 Nm (59 lb-ft).

Upper body mount

2. Loosen the remaining body mount bolts.

3. Raise the vehicle body enough to remove the upper body mount.

Upper and lower body mount

4. **NOTE:** No lubricants of any kind are to be used during body mount installation.

NOTE: Do not reuse body mount fasteners. New fasteners must be installed for each fastener that has been removed or loosened.

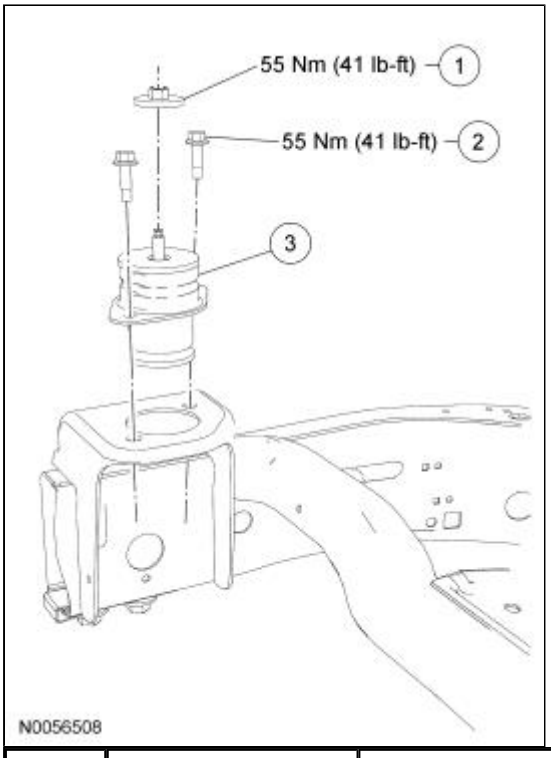
To install, reverse the removal procedure.

Body Support — Number 4

Printable View (147 KB)

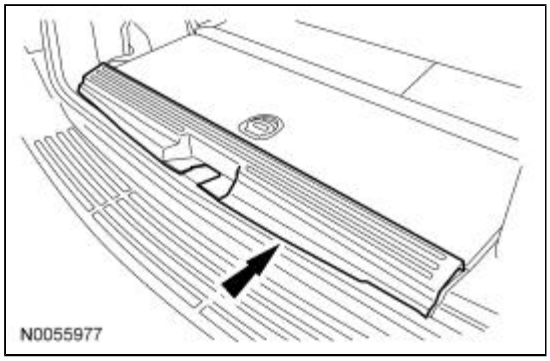
Removal and Installation

No. 4 Body Mount

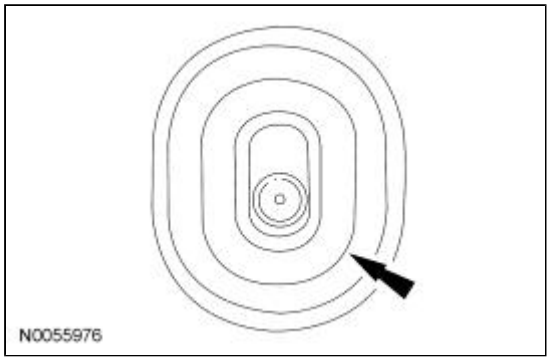


Item	Part Number	Description
1	W708109	Body mount nut and washer
2	W506433	Body mount bolt (2 required)
3	7800192	Body mount

1. Remove the liftgate scuff plate.



2. Remove the body mount bolt cover.



3. Remove the body mount nut.
    - To install, tighten to 55 Nm (41 lb-ft).

4. Loosen the remaining body mount bolts.

5. Raise the vehicle body enough to remove the body mount bolts.
    - To install, tighten to 55 Nm (41 lb-ft).

6. **NOTE:** No lubricants of any kind are to be used during body mount installation.

   NOTE: Do not reuse body mount fasteners. New fasteners must be installed for each fastener that has been removed or loosened.

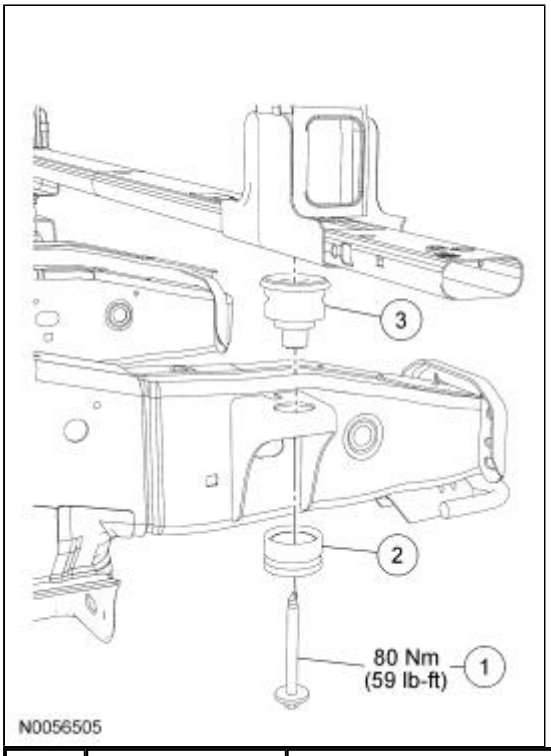
   To install, reverse the removal procedure.

Body Support — Front End Sheet Metal

Printable View (122 KB)

Removal and Installation

Front End Sheet Metal Body Mount



Item	Part Number	Description
1	78001B39	Radiator front end sheet metal mount bolt
2	7800193	Lower front end sheet metal body mount
3	7800192	Upper front end sheet metal body mount

Upper and lower body mount

1. Remove the lower front end sheet metal body mount.
    1. Remove the lower front end sheet metal body mount bolt.
    2. Remove the lower front end sheet metal body mount.
        - To install, tighten to 80 Nm (59 lb-ft).

Upper body mount

2. Loosen the remaining body mount bolts.

3. Raise the vehicle body enough to remove the upper front end sheet metal body mount.

Upper and lower body mount

4. **NOTE:** No lubricants of any kind are to be used during body mount installation.

NOTE: Do not reuse body mount fasteners. New fasteners must be installed for each fastener that has been removed or loosened.

To install, reverse the removal procedure.

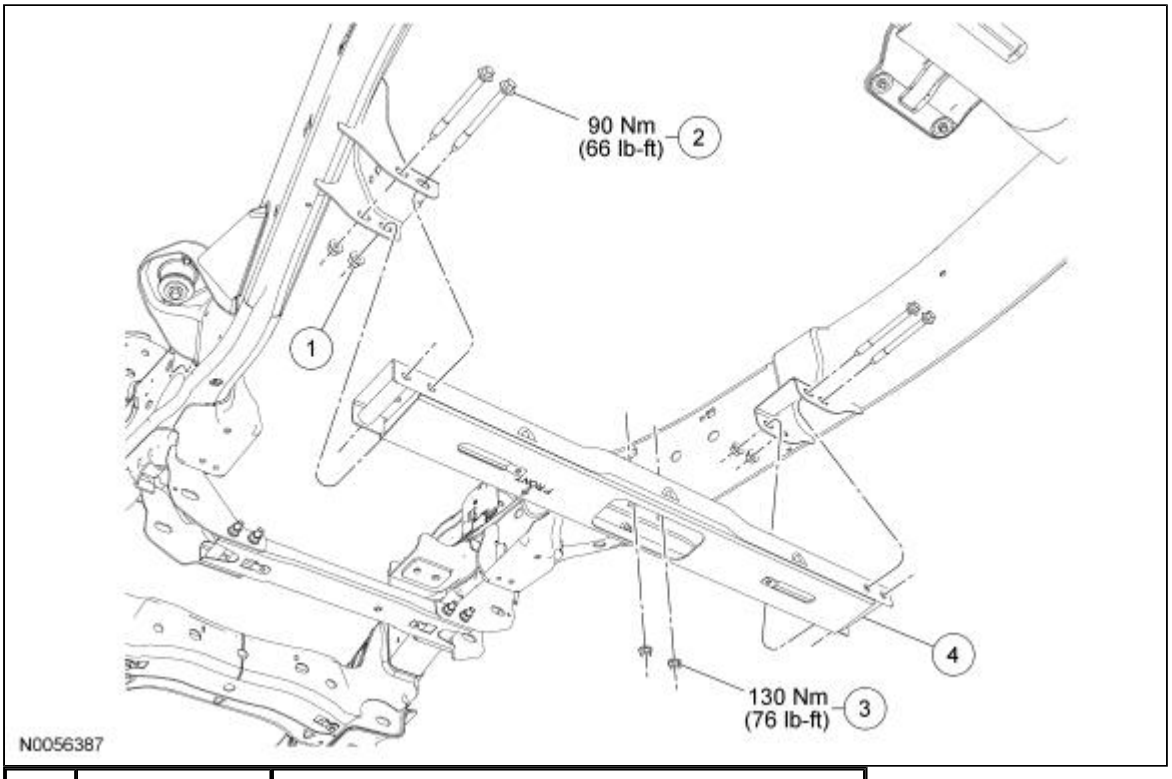
Transmission Support Crossmember

Printable View (235 KB)

Removal and Installation

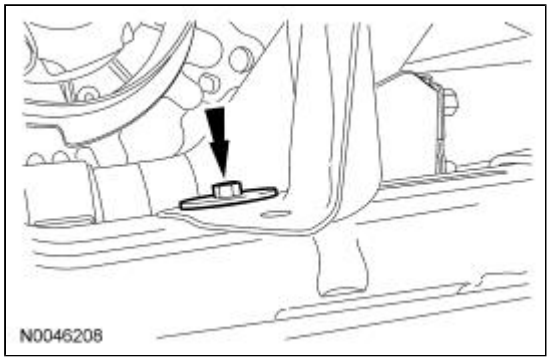
Transmission Support Crossmember - Exploded View

NOTE: Transmission not shown for clarity.

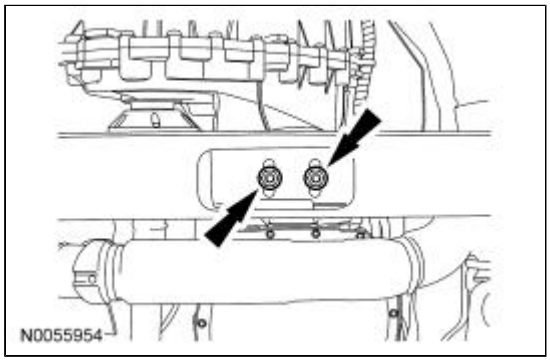


Item	Part Number	Description
1	W520114-S427	Transmission support crossmember nut (4 required)
2	W705049-S426	Transmission support crossmember bolt (4 required)
3	N621945-S301	Transmission mount nut (2 required)
4	5059	Transmission support crossmember

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. If equipped, remove the skid plate fasteners and skid plate.
3. Remove the LH and RH exhaust heat shield-to-crossmember fasteners.



4. Remove the 2 transmission mount nuts.
    - To install, tighten to 103 Nm (76 lb-ft).

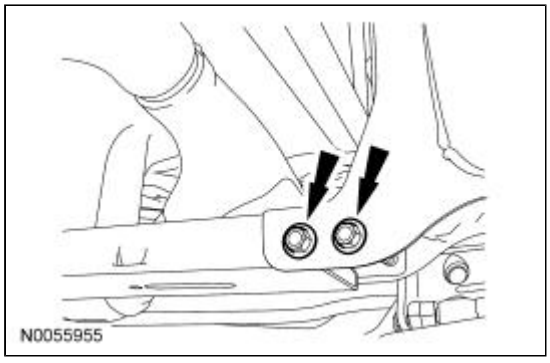


5. Support the transmission.

6. **NOTE:** Mark the transmission crossmember next to the edge of the frame bracket to make sure the crossmember is installed in the same position it was removed from.

   NOTE: The crossmember nuts are installed on the crossmember bolts facing the front of the vehicle.

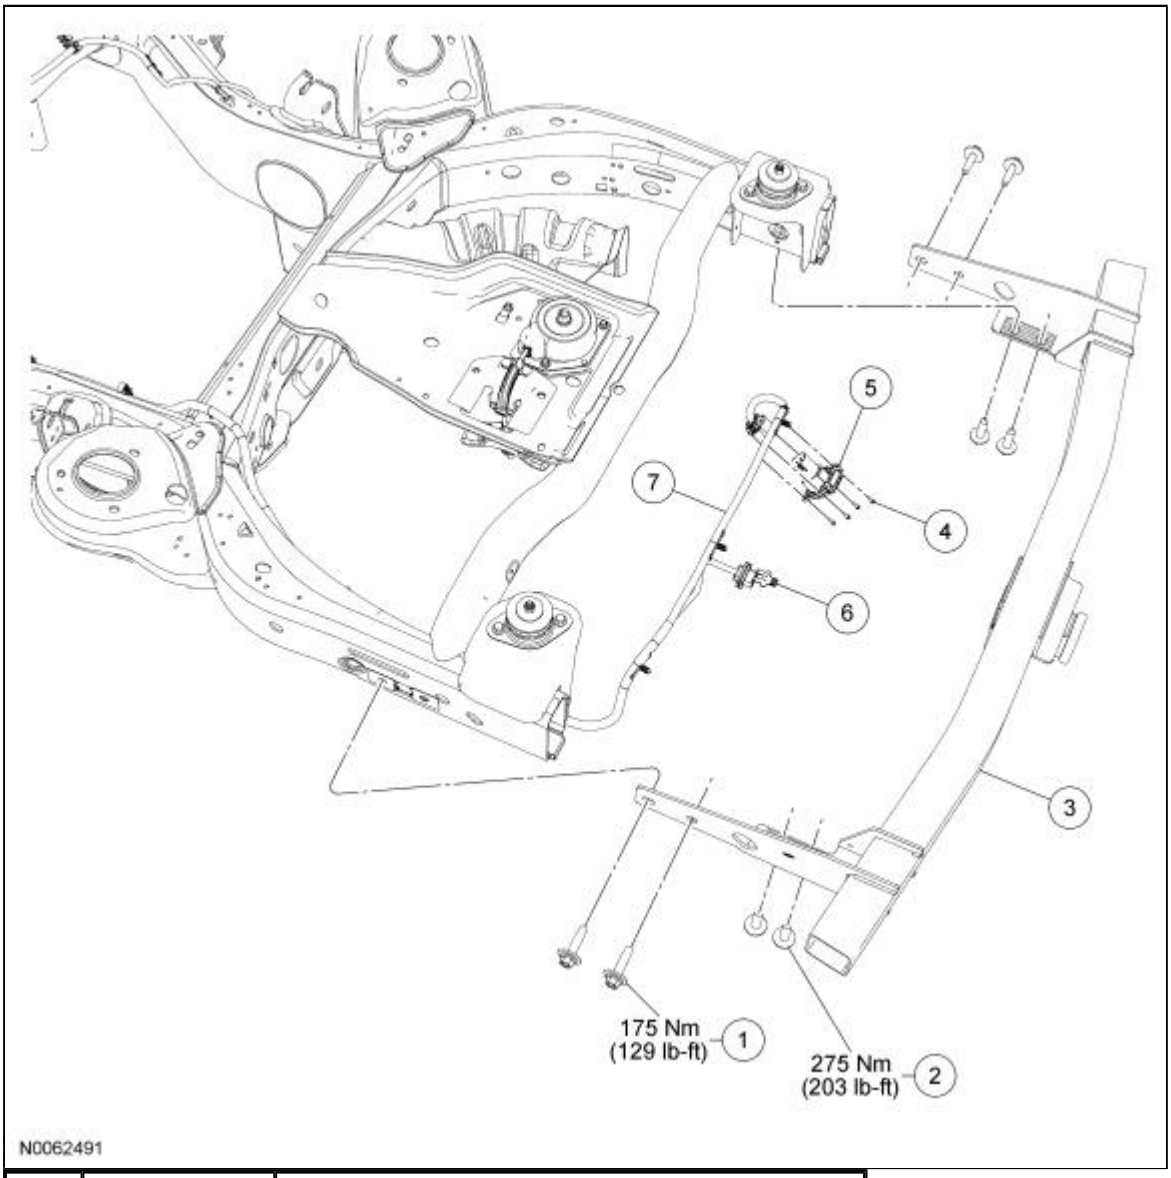
   Remove the 4 transmission crossmember bolts (2 each side) and the transmission crossmember.
    - To install, tighten to 90 Nm (66 lb-ft).



7. To install, reverse the removal procedure.

Trailer Hitch

Printable View (363 KB)



Item	Part Number	Description
1	W708795	Trailer hitch side mounting bolt (4 required)
2	W711408	Trailer hitch lower mounting bolt (4 required)
3	17775	Trailer hitch
4	N611038	Trailer hitch lighting plug bolt (4 required)
5	14489	Trailer hitch lighting socket
6	—	Trailer hitch electrical connector
7	—	Trailer hitch wiring harness

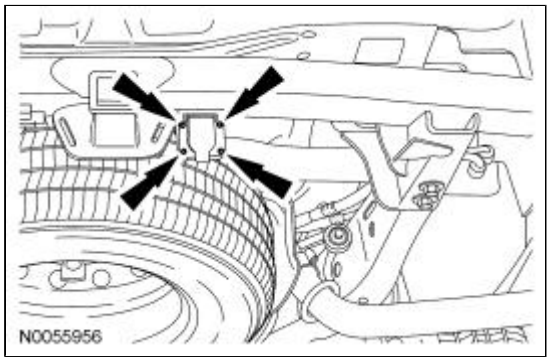
Removal and Installation

WARNING: Do not permanently remove the trailer hitch. Always reinstall the hitch before delivery of the vehicle to the customer. Failure to follow this warning could increase the risk of injury in a rear end collision.

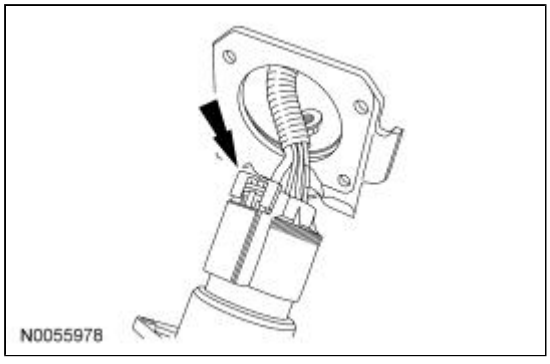
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the trailer hitch rear bumper cover trim panel, if equipped.

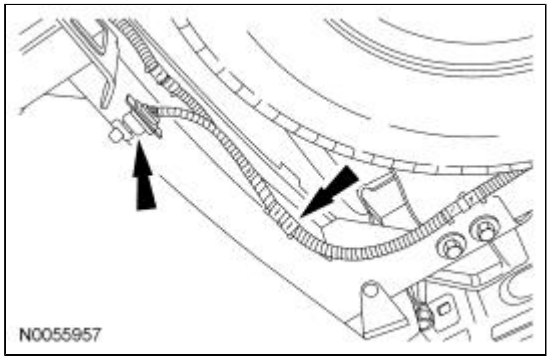
3. Remove the 4 trailer lighting plug cover bolts.



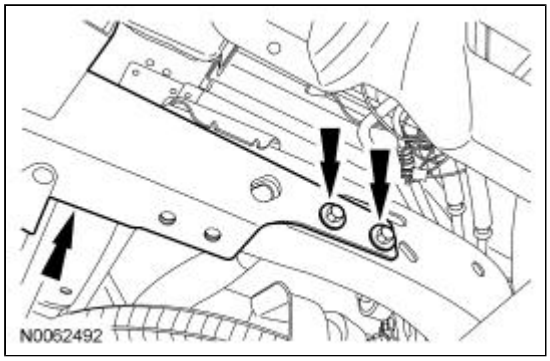
4. Remove the trailer lighting plug.
   - Position the plug away from the trailer hitch.
   - Disconnect the electrical connector.
   - Remove the trailer lighting plug.



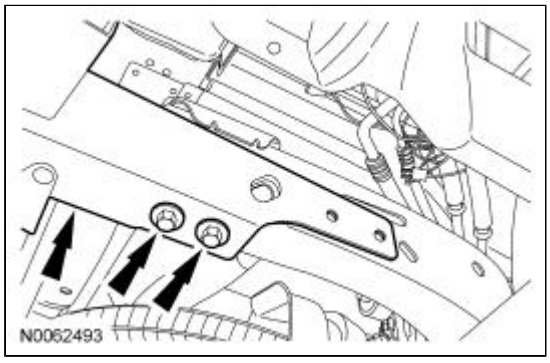
5. Remove the electrical connector from the trailer hitch and unclip the harness from the retainers on the frame.



6. Remove the 4 (2 each side) trailer hitch side mounting bolts.
   - To install, tighten to 175 Nm (129 lb-ft).



7. Remove the 4 (2 each side) trailer hitch lower mounting bolts and remove the trailer hitch.
    - To install, tighten to 275 Nm (203 lb-ft).



8. To install, reverse the removal procedure.

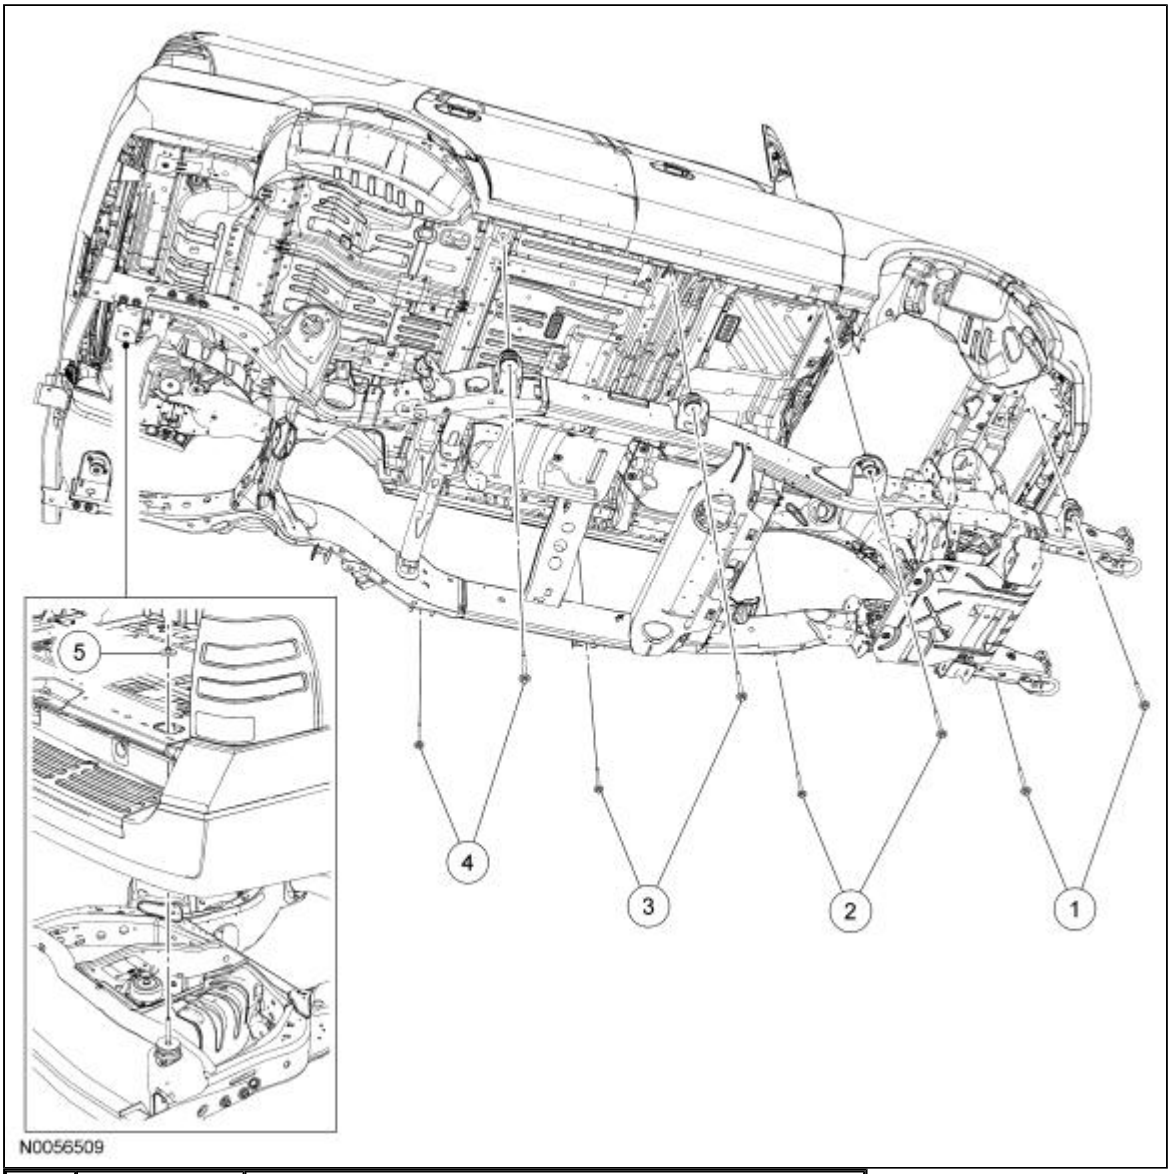
Special Tool(s)

ST2591-A	Disconnect Tool, Transmission Cooler Lines 307-441
ST2670-A	Disconnect Tool, Transmission Cooler Lines 307-459

Body Off Mounting Locations



Item	Part Number	Description
1	—	Front end sheet metal (FESM) mounting bolt (2 required)
2	—	Body mount No. 1 mounting bolt (2 required)
3	—	Body mount No. 2 mounting bolt (2 required)
4	—	Body mount No. 3 mounting bolt (2 required)
5	—	Body mount No. 4 mounting bolt (2 required)

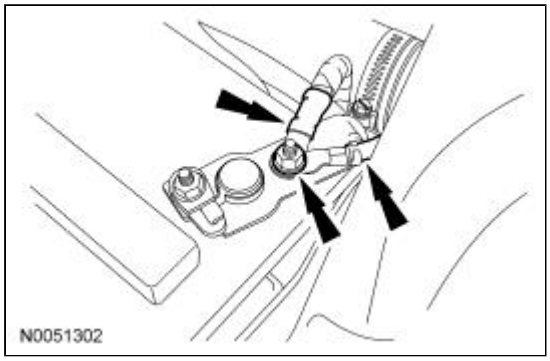
1. **NOTE:** A 2-post hoist must be used to lift the body from the chassis.

   Open the tail gate.

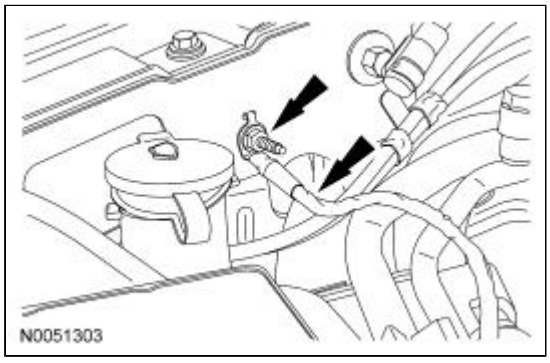
2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. Disconnect the battery cables. For additional information, refer to Section 414-01 .

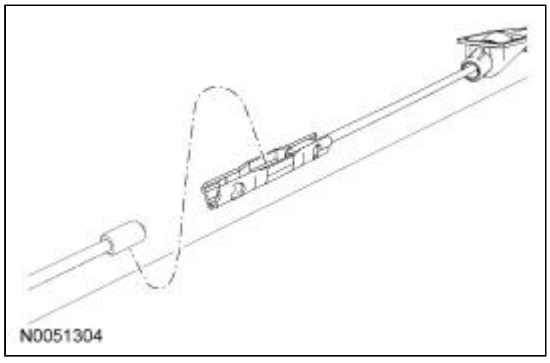
4. Remove the nut and separate the leads from the battery positive cable and position aside.
   - To install, tighten to 9 Nm (80 lb-in).



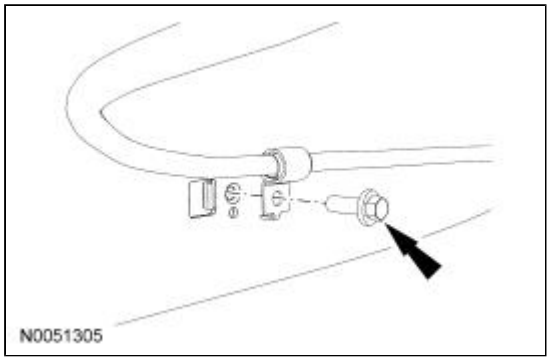
5. Remove the nut and the ground wire from the right fender.
    - To install, tighten to 12 Nm (9 lb-ft).



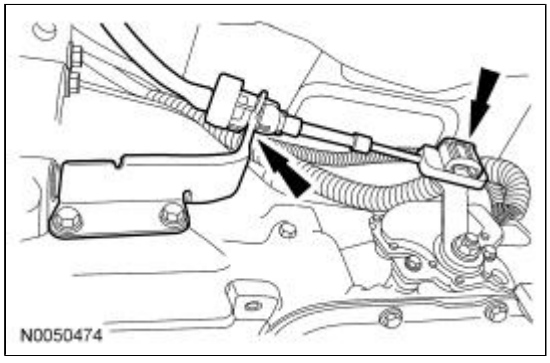
6. Remove the ground wire from the clip on the battery tray.
7. Recover the refrigerant. For additional information, refer to Section 412-00 .
8. Drain the engine coolant. For additional information, refer to Section 303-03 .
9. Remove the front bumper cover. For additional information, refer to Section 501-19 .
10. Remove the rear bumper cover. For additional information, refer to Section 501-19 .
11. Raise the vehicle.
12. Remove the running boards, if equipped. For additional information, refer to Section 501-08 .
13. Release the parking brake tension and disconnect the parking brake cable at the intermediate connection.



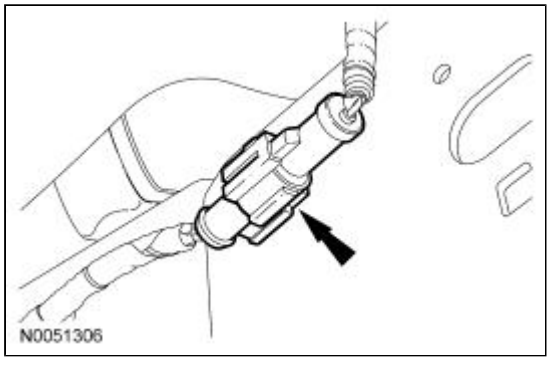
14. Remove the parking brake cable-to-frame bolt.
    - To install, tighten to 15 Nm (11 lb-ft).



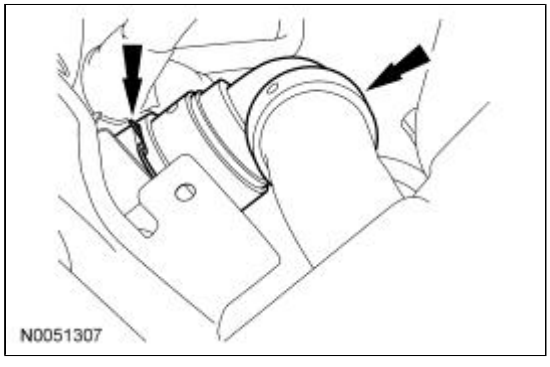
15. Disconnect the automatic transmission cable from the manual valve and retainer clip.



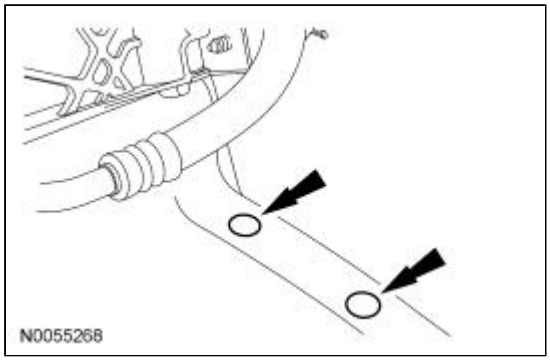
16. Disconnect the steering gear electrical connector and remove the connector from the frame.



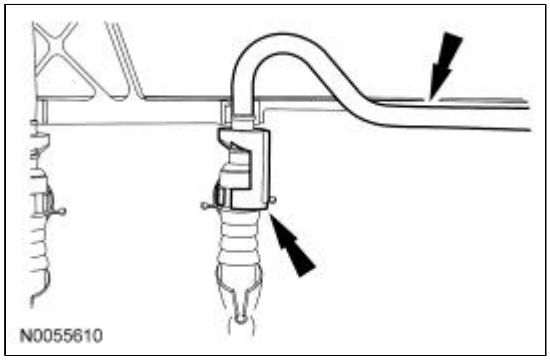
17. Remove the retaining ring and disconnect the lower radiator hose from the radiator.



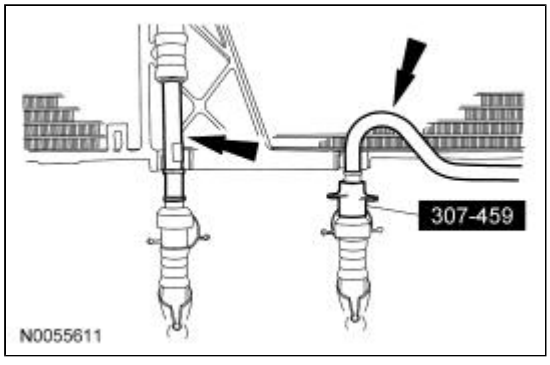
18. Remove the 4 pushpins (2 each side) from the frame-to- radiator air deflector.



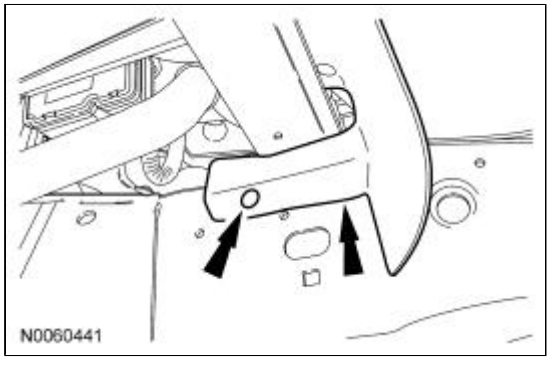
19. Remove the safety clips from the transmission cooler lines.



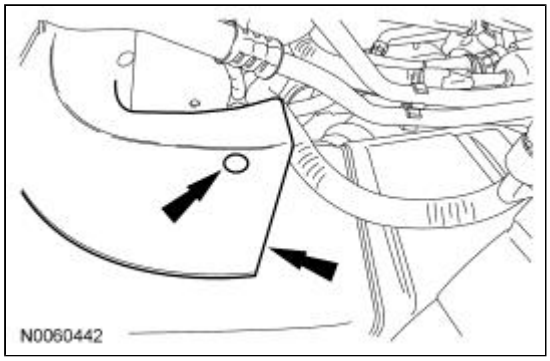
20. Using the special tool, disconnect the transmission cooler lines from the auxiliary cooler.



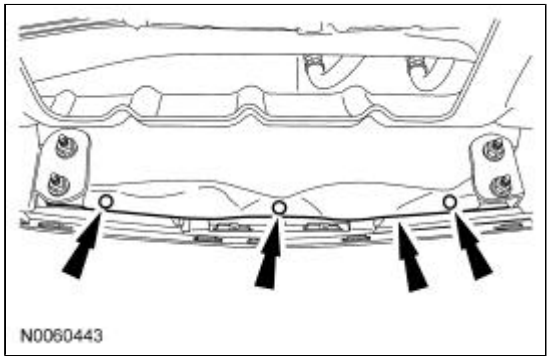
21. Remove the retainer from the splash shield on the front LH frame.



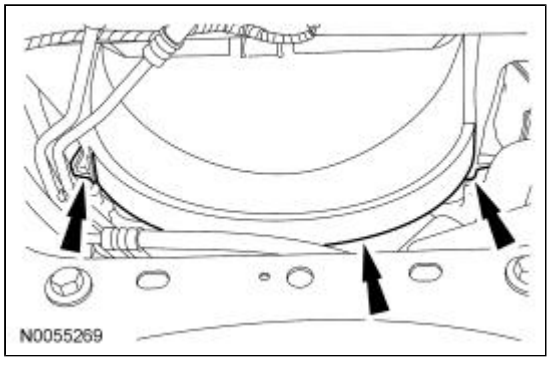
22. Remove the retainer from the splash shield on the front RH frame.



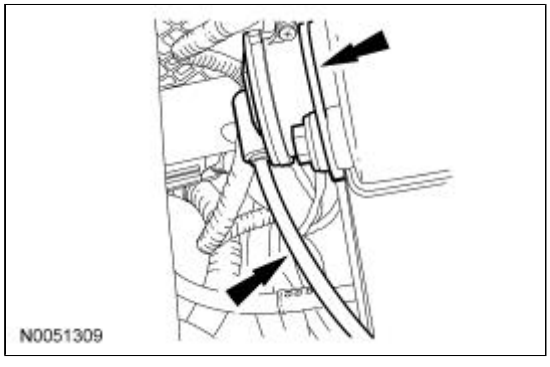
23. Remove the 3 retainers from the splash shield on the lower condenser.



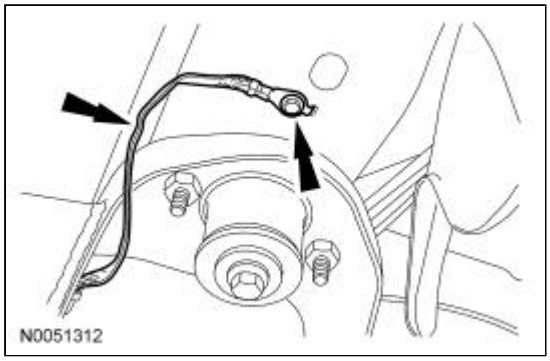
24. Release the fan shroud from the retainers and open the fan shroud.



25. If equipped, disconnect the air hose from the air suspension compressor.



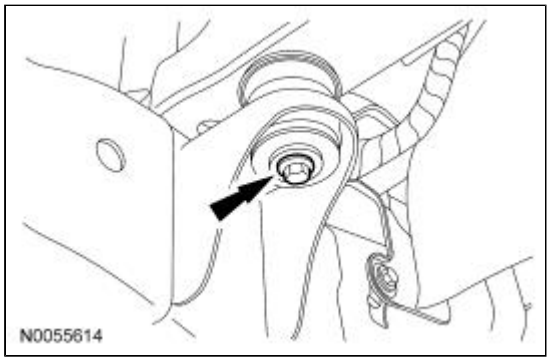
26. Remove the bolt and the ground wire from the body.



NOTE: Right front body bolt shown, all other bolts similar.

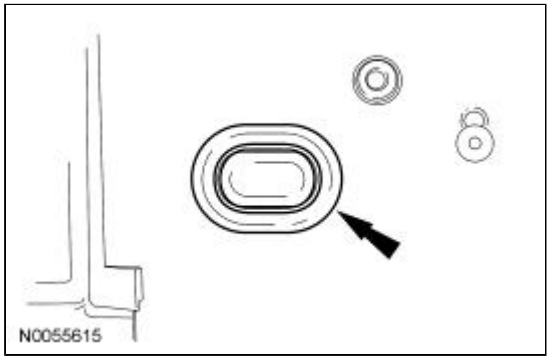
27. **NOTE:** Front end sheet metal body support bolt shown, all other bolts similar.

    Remove the 6 body mount bolts and 2 front end sheet metal body support bolts.
    - Discard the body bolts.
    - To install, tighten the front end sheet metal, body mount No. 2 and No. 3 to 80 Nm (59 lb-ft).
    - To install, tighten No. 1 body mount to 103 Nm (76 lb-ft).

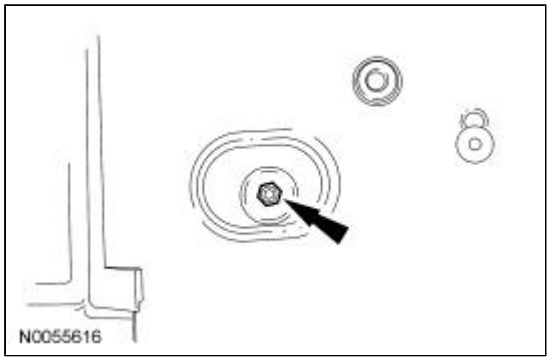


28. Lower the vehicle and chock the wheels to prevent the chassis from moving.

29. Remove the 2 bolt covers from the rear storage compartment.

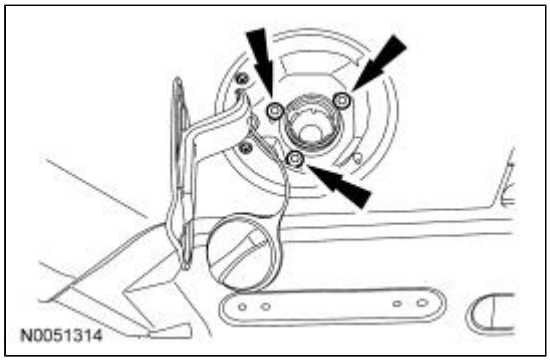


30. Remove the 2 rear body mount nuts from the rear storage compartment.
    - Discard the nuts.
    - To install, tighten to 80 Nm (59 lb-ft).



31. **CAUTION: The fuel tank filler pipe may become caught on the inside of the fender when lifting the vehicle. Make sure the fuel tank filler pipe is not binding when lifting the vehicle, or damage may occur.**

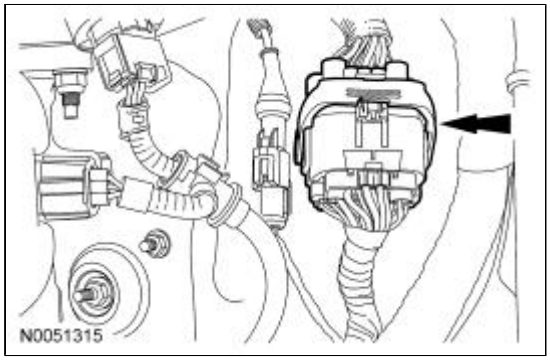
    Remove the 3 screws from the fuel tank filler pipe.



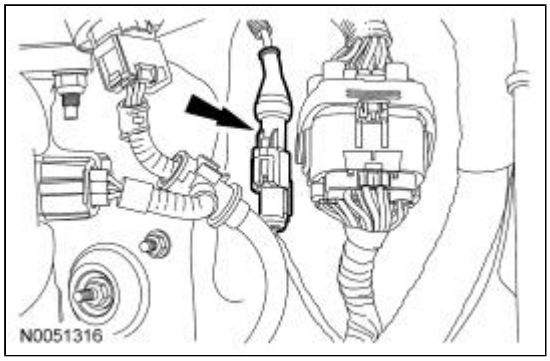
32. Remove the engine cover, if equipped.

33. Remove the air cleaner intake pipe. For additional information, refer to Section 303-12 .

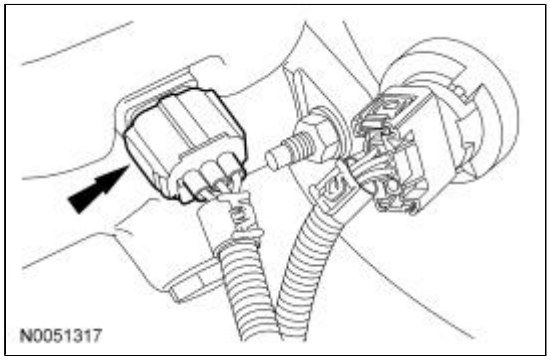
34. Disconnect the fuel bundle wiring harness connector and remove from the splash shield.



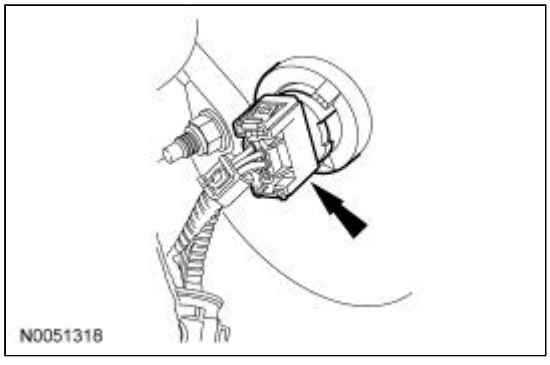
35. Disconnect the left anti-lock brake system (ABS) wheel speed sensor (WSS) connector.



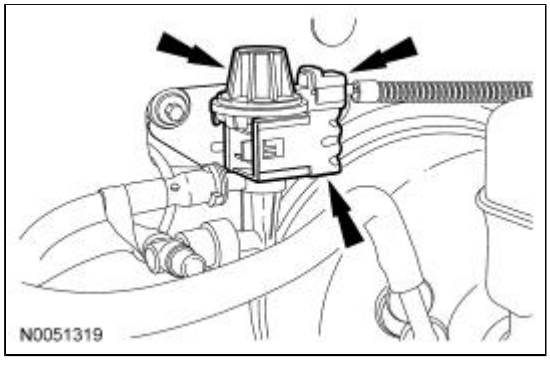
36. Disconnect the master cylinder electrical connector.



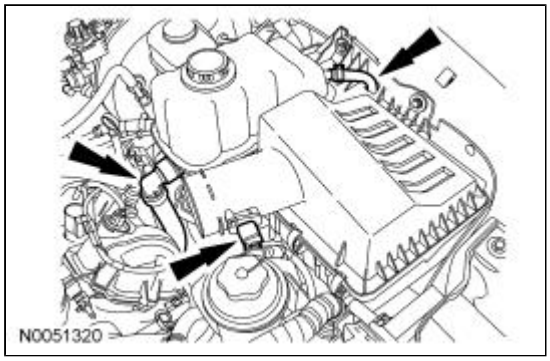
37. Disconnect the brake booster electrical connector.



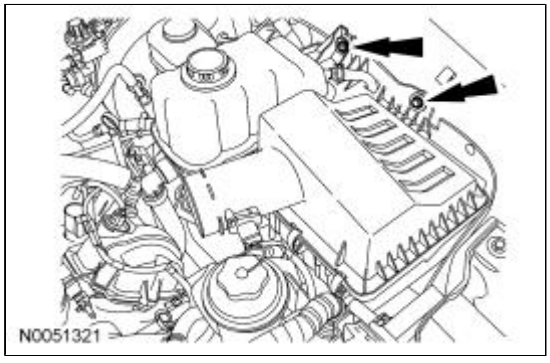
38. Disconnect the canister purge valve electrical connector and remove it from the bracket, position the canister aside.



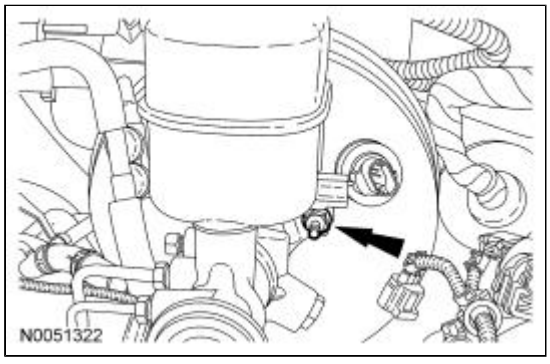
39. Disconnect the electrical connector and the 2 hoses from the degas bottle/air cleaner module.
    - Unclip the RH hose from the retainers on the side of the degas bottle/air cleaner module.



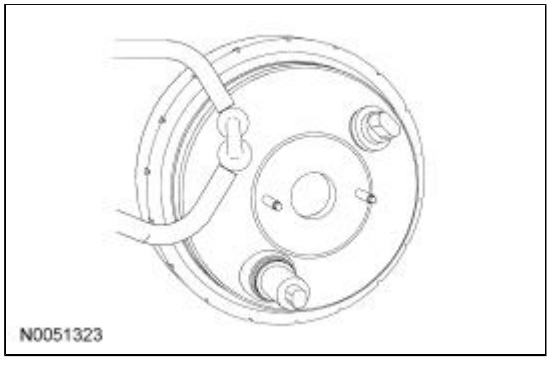
40. Remove the 2 bolts from the degas bottle/air cleaner module and remove the module.



41. Remove the 2 master cylinder nuts (1 each side) from the brake booster and secure the master cylinder to the engine.



42. Disconnect the brake booster vacuum supply hose and secure the hose to the engine.

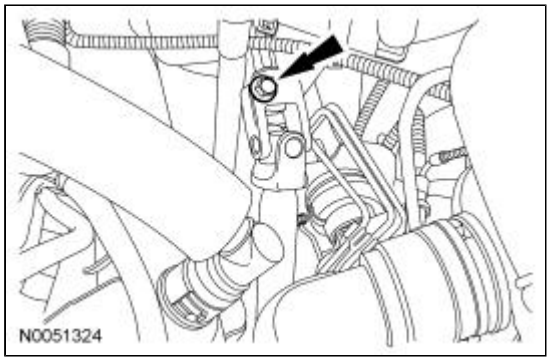


43. **NOTE:** Make sure that the vehicle wheels are straight.

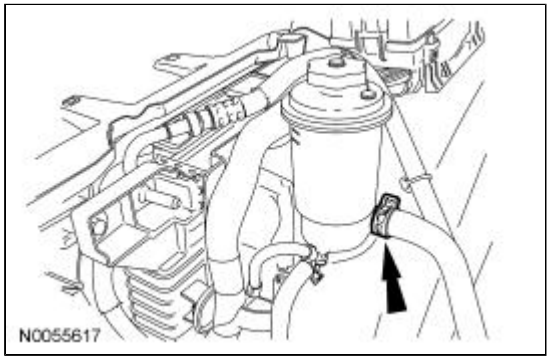
    Place the vehicle in PARK and remove the key.

44. **CAUTION: Do not allow the steering column shaft to rotate while the intermediate shaft is disconnected or damage to the clockspring can result. If there is evidence that the shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

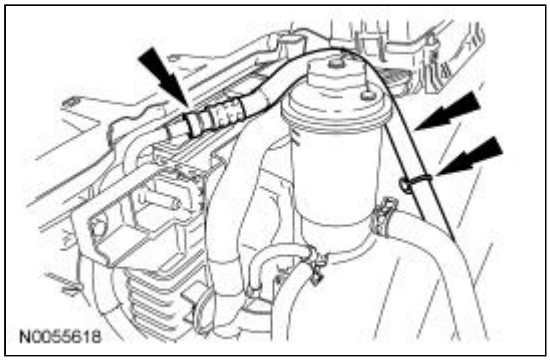
    Remove the steering shaft bolt at the joint between the intermediate and lower shafts and separate the shafts.
    - To install, refer to 25 Nm (18 lb-ft).



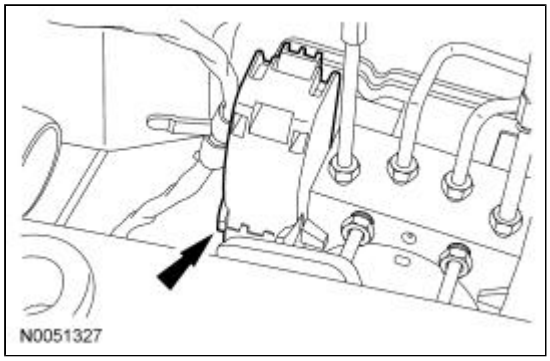
45. Disconnect the power steering reservoir-to-power steering pump hose.



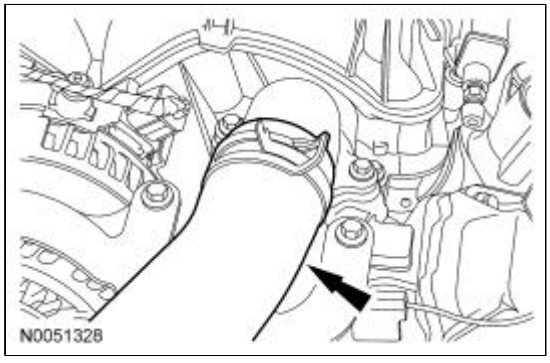
46. Disconnect the power steering pump-to-power steering cooler line quick connect.
    - Disconnect the hose from the retainer on the fan shroud.



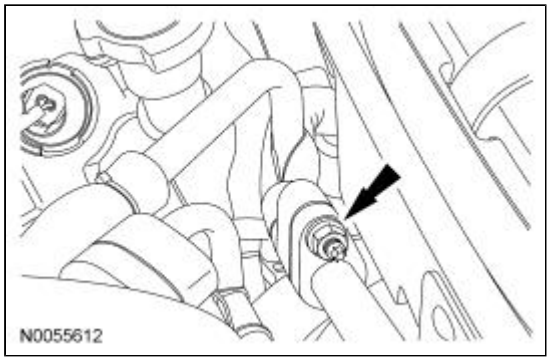
47. Disconnect the ABS module connector.



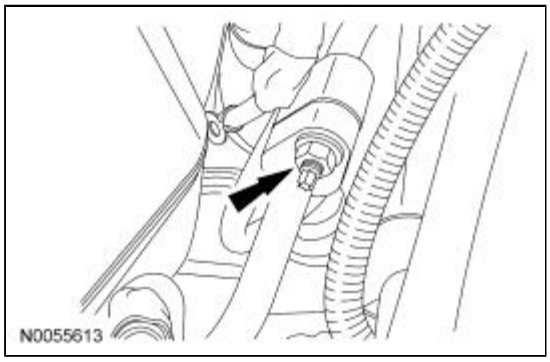
48. Disconnect the upper radiator hose from the engine.



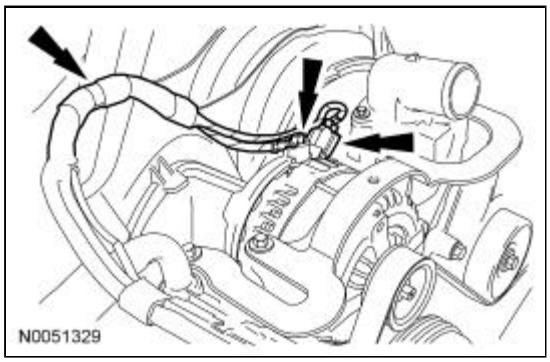
49. Remove the nut from the condenser-to-manifold and tube assembly and position aside.
    - Install new O-rings before installing the manifold and tube assembly.
        - To install, tighten to 25 Nm (18 lb-ft).



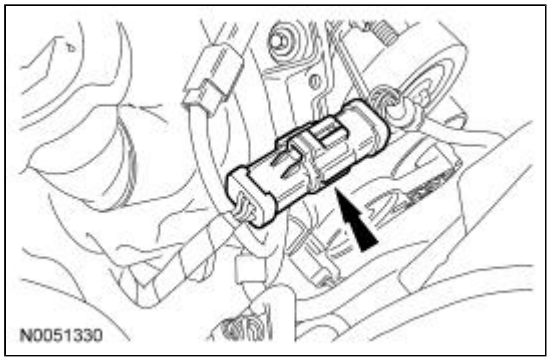
50. Remove the nut from the accumulator-to-manifold and tube assembly and position aside.
    - Install new O-rings before installing the manifold and tube assembly.
        - To install, tighten to 25 Nm (18 lb-ft).



51. Remove the nut and disconnect the electrical connector from the generator wiring harness and remove from the retainer.

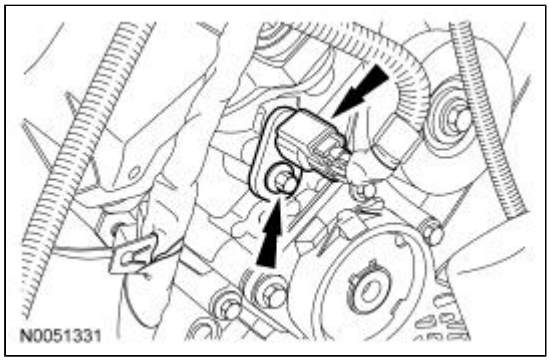


52. Disconnect the electrical connector from the electrical thermal connector on the front of the engine.

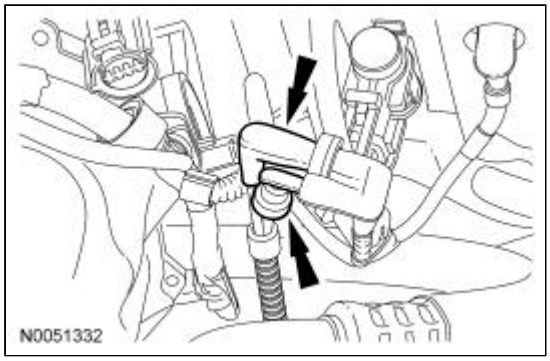


53. **NOTE:** RH shown, LH similar.

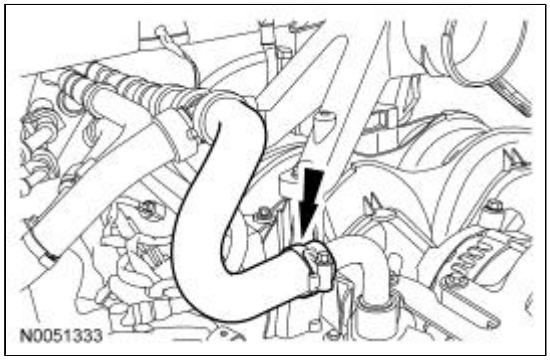
    Remove the bolts and the camshaft position (CMP) sensors (1 each side). Discard the O-ring seals.
    - To install, tighten to 10 Nm (89 lb-in).
    - Lubricate the O-ring seal with clean engine oil prior to installation.



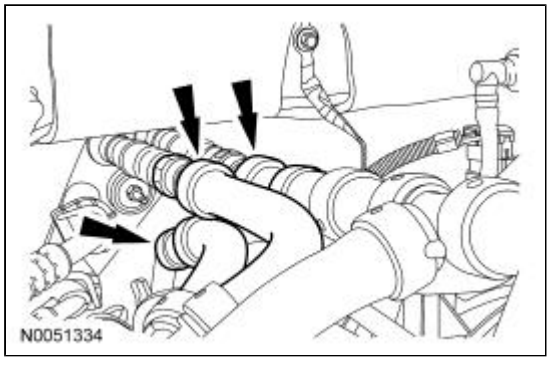
54. If equipped, disconnect the right vacuum lines for the four wheel drive (4WD) hub actuators.



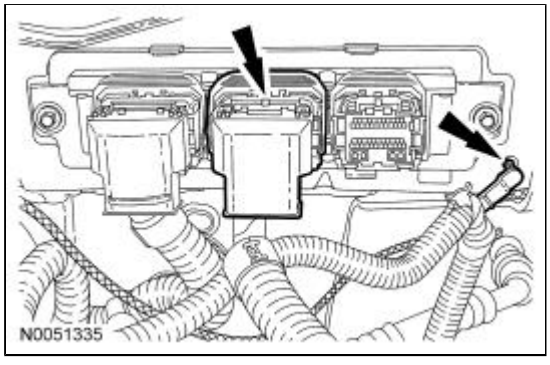
55. Disconnect the heater hose from the engine.



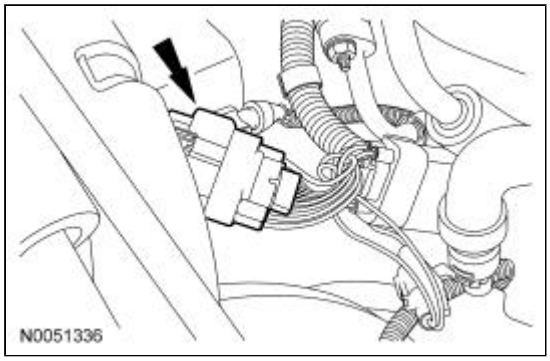
56. Disconnect the 3 heater hose quick disconnect fittings.



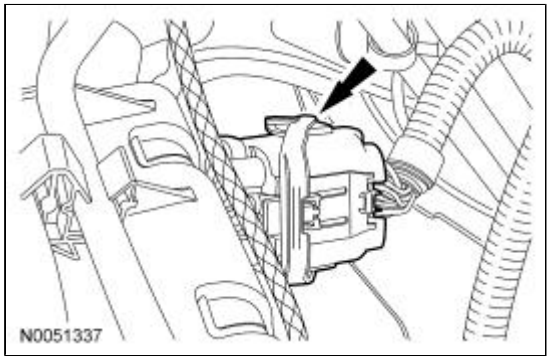
57. Disconnect the engine electrical connector from the powertrain control module (PCM) and remove the retainer from the bulkhead.



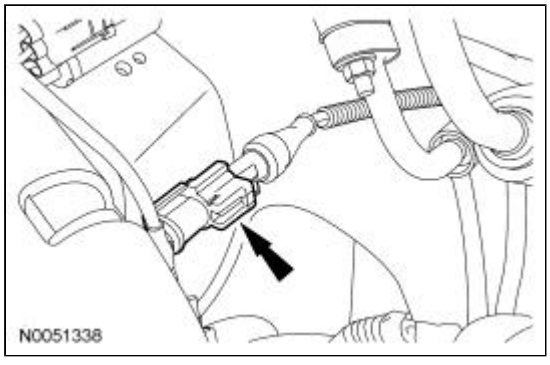
58. Disconnect the engine electrical connector from the wiring harness and position aside.



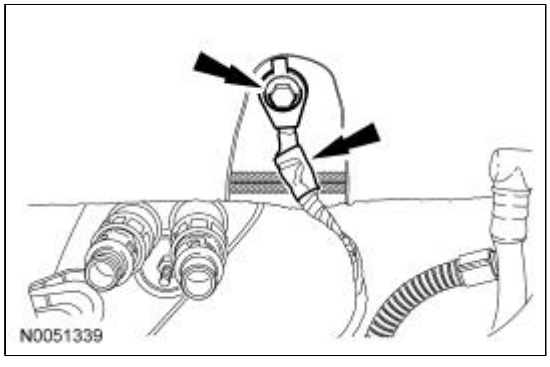
59. Disconnect the transmission electrical connector from the harness and the clip on the A/C line.



60. Disconnect the right side ABS wheel speed sensor (WSS) connector.



61. Remove the bolt and the ground wire from the front of the bulkhead.



62. **NOTE:** Marking the position of the tires will aid in aligning the cab to the chassis.

    Mark the position of the tires on the floor.

63. **NOTE:** A 2-post hoist must be used to lift the body from the chassis.

    Position the hoist lift pads, equally side-to-side, below the pinch welds at the furthest most possible front and rear positions.

64. **WARNING: The cab will become unstable once it is lifted from the frame. It will be necessary to secure the cab to the hoist with the appropriate straps so that the cab does not come off of the hoist. Failure to follow these instructions may result in personal injury.**

    CAUTION: An assistant will be necessary to make sure all the connections are disconnected and nothing interferes with the raising of the body while it is lifted.

    With the aid of an assistant lift the body from the chassis.

65. To install, reverse the removal procedure.
    - Align the tires to the marks on the floor.
    - Top off the fluids.

GENERAL INFORMATION

INTRODUCTION

In the past, when cars were simpler, diagrams were simpler. All components were connected by wires, and diagrams seldom exceeded 4 pages in length. Today, some wiring diagrams require more than 16 pages. It would be impractical to expect a service technician to trace a wire from page 1 across every page to page 16.

Components shown with a dashed line instead of a solid line indicate not all circuits are shown in this particular diagram (circuits shown in system diagrams are typically applicable to that system only). The remaining circuits connected to that component will be shown in the appropriate system that they apply to.

Today, the wiring diagram necessary to support a given repair procedure is included within that article or a link is provided to the appropriate SYSTEM WIRING DIAGRAM article. For example, the wiring diagram for a Ford EEC-IV system may be included in ENGINE PERFORMANCE and WIRING DIAGRAMS articles for Ford Motor Co. The wiring diagram for a cruise control system may be included in ACCESSORIES & EQUIPMENT section for the specific vehicle manufacturer, and the wiring diagram for an anti-lock brake system may be included in BRAKES and WIRING DIAGRAMS for the specific manufacturer.

WIRING DIAGRAMS contains all wiring diagrams not included in STARTING & CHARGING SYSTEMS and ACCESSORIES & EQUIPMENT. This includes: Data Link Connectors, Ground Distribution, Power Distribution, Engine Performance, Electric Cooling Fans, Anti-Lock Brakes, Electronic Suspension and Electronic Steering wiring diagrams. The Data Link Connectors wiring diagrams show the circuits by which the various on-board computers exchange information, and the diagnostic connectors used for diagnosis and their location. The Ground Distribution wiring diagrams show all vehicle ground points, their location, and the components common to those ground points. The Power Distribution wiring diagrams show the power feed circuits and the components common to those power feeds.

Wiring diagrams used to support the information in ACCESSORIES & EQUIPMENT are drawn in a "top-down" format. The diagrams are drawn with the power source at the top of the diagram and the ground point at the bottom of the diagram. Component locations are identified on the wiring diagrams. Any wires that do not connect directly to a component are identified on the diagram to indicate where they go.

WIRING DIAGRAM COLOR ABBREVIATIONS

COLOR ABBREVIATIONS

Color	Normal	Optional

Black	BLK	BK

Red	RED	RD
Tan	TAN	TN
Violet	VIO	VI
White	WHT	WT
Yellow	YEL	YL

WIRING DIAGRAM SYMBOLS

NOTE: Standard wiring symbols are used on all wiring diagrams. The list below will help clarify any symbols that are not easily understood at a glance. Most components are labeled "Motor", "Switch" or "Relay" in addition to being drawn with the standard symbol.

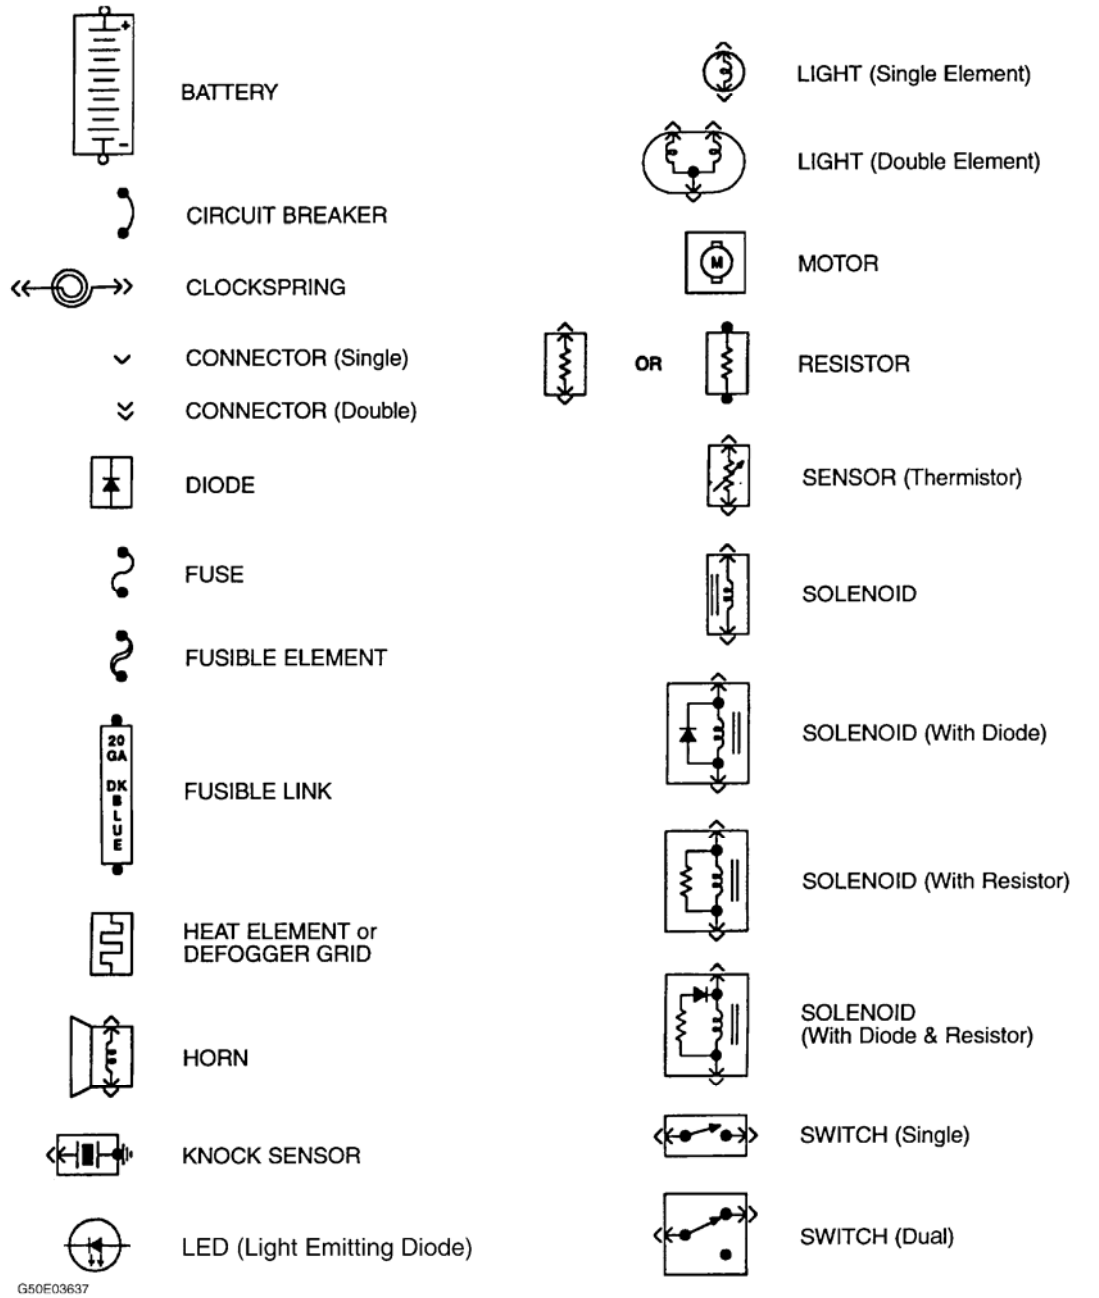

Fig. 1: Identifying Standard Wiring Diagram Symbols

WIRING DIAGRAM GROUND NUMBER LOCATIONS

NOTE: **The following illustration depicts standardized ground numbers and locations to be used in conjunction with wiring diagrams applying to 2001 and prior model years only. See Fig. 2 . Wiring diagrams applying to newer model years depict manufacturer-specified ground numbers and locations. Do not utilize the illustration with 2002 and newer**

model year wiring diagrams.

Fig. 2: Ground Numbers & Locations (2001 & Prior Model Years)

WIRING DIAGRAM COMPONENT LOCATIONS

When trying to locate a component in a wiring diagram and you don't know the specific system where it is located, use this handy component locator to find the system wiring diagram in which the component is located. Then, go to that system and locate the component within the wiring diagram.

For example, if you don't know the specific system in which the ignition switch is located, look up ignition switch in the wiring diagram component location tables and go to the appropriate wiring diagram(s) which contain either full or partial views of the ignition switch. The full view of the ignition switch is located in Power Distribution.

The first listing for the component will be the full or most complete view of the component. Additional listings will be partial views of the component. Not all components are used on all models.

All components will have a partial view in Ground Distribution and Power Distribution. Data Link Connectors show connecting circuits between modules. Alternate names for components may be listed in wiring diagram component locations tables.

WIRING DIAGRAM COMPONENT LOCATIONS

Component	Wiring Diagram
ABS Electronic Control Unit	Anti-Lock Brakes; Data Link Connectors
ABS Hydraulic Unit	Anti-Lock Brakes
Acceleration Sensor	Anti-Lock Brakes
Accessory Delay Relay	Power Windows
A/C Compressor Clutch Relay	Engine Performance
A/C Sensor	Engine Performance
A/C Pressure Switch	Engine Performance
Adaptive Lamp Control Module	Exterior Lights
Air Bag(s)	Air Bag Restraint System
Air Bag Module	Air Bag Restraint System
Air Bag Sensor(s)	Air Bag Restraint System
Air Injection Pump Relay	Engine Performance
Air Temperature Sensor	Overhead Console
Alternator (Generator)	Generators & Regulators
Anti-Theft Control Module	Anti-Theft System; Starters
Autolamp Control Relay	Headlight Systems; Daytime Running Lights
Automatic Shutdown (ASD) Relay	Engine Performance; Generators & Regulators
Autostick Switch	Engine Performance
Auxiliary Battery Relay	Generators & Regulators
Back-Up Lights	Back-Up Lights; Exterior Lights
Barometric (BARO) Pressure Sensor	Engine Performance
Battery	Power Distribution
Battery Temperature Sensor	Engine Performance
Body Control Module	Body Control Computer; Anti-Theft System; Daytime Running Lights; Engine Performance; Headlight Systems; Warning Systems
Boost Control Solenoid	Engine Performance
Boost Sensor	Engine Performance
Brake Fluid Level Switch	Analog Instrument Panels
Brake On/Off (BOO) Switch	Cruise Control Systems; Engine Performance; Shift Interlock Systems
Buzzer Module	Warning Systems

Camshaft Position (CMP) Sensor	Engine Performance
Central Control Module	Anti-Theft System
Clockspring	Air Bag Restraint System; Cruise Control Systems; Steering Column Switches
Clutch Pedal Position Switch	Starters
Clutch Start Switch	Starters
Combination Meter	Analog Instrument Panels
Constant Control Relay Module (CCRM)	Engine Performance; Electric Cooling Fans
Convenience Center	Power Distribution; Illumination/Interior Lights
Convertible Top Motor	Power Convertible Top
Convertible Top Switch	Power Convertible Top
Crankshaft Position (CKP) Sensor	Engine Performance
Cruise Control Module	Cruise Control Systems
Cruise Control Switch	Cruise Control Systems
Condenser Fan Relay(s)	Electric Cooling Fans
Data Link Connector (DLC)	Engine Performance
Daytime Running Lights Module	Daytime Running Lights; Exterior Lights
Defogger Relay	Rear Window Defogger
Diagnostic Energy Reserve Module (DERM)	Air Bag Restraint System
Discriminating Sensor (Air Bag)	Air Bag Restraint System
Distributor	Engine Performance
Door Lock Actuators	Power Door Locks; Remote Keyless Entry
Door Lock Relay(s)	Power Door Locks
Electrochromic Mirror	Power Mirrors
Electronic Level Control (ELC) Height Sensor	Electronic Suspension
Electronic Level Control (ELC) Module	Electronic Suspension
Engine Coolant Temperature (ECT) Sending Unit	Analog Instrument Panels
Engine Coolant Temperature (ECT) Sensor	Engine Performance
Engine Control Module	Engine Performance; Generators & Regulators; Starters
ETACS ECU	Warning Systems; Power Windows; Remote Keyless Entry
Evaporative (EVAP) Emissions Canister	Engine Performance
EVAP Canister Purge Solenoid	Engine Performance
EVAP Canister Vent Solenoid	Engine Performance
Exhaust Gas Recirculation (EGR) Valve	Engine Performance
Fuel Tank Vacuum Sensor	Engine Performance
Fog Lights	Headlight Systems; Daytime Running Lights
Fog Light Relay	Headlight Systems; Daytime Running Lights
Fuel Door Release Solenoid	Power Fuel Door Release
Fuel Gauge Sending Unit	Analog Instrument Panels
Fuel Injectors	Engine Performance
Fuel Pump	Engine Performance
Fuel Pump Relay	Engine Performance; Power Distribution

Fuse/Relay Block	Power Distribution
Fusible Links	Power Distribution; Generators & Regulators; Starters
Generator	Generators & Regulators; Engine Performance; Power Distribution
Generic Electronic Module (GEM)	Body Control Modules; Electronic Suspension
Glow Plug Relay	Engine Performance
Glow Plugs	Engine Performance
Grounds	Ground Distribution
Headlight Door Module	Headlight Doors
Headlight Relay	Headlight Systems; Daytime Running Lights
Headlights	Headlight Systems; Daytime Running Lights
Heated Oxygen Sensor(s) (HO2S)	Engine Performance
Heated Windshield Control Module	Heated Windshields
Height Sensor	Electronic Suspension
Horns	Steering Column Switches
Horn Relay	Steering Column Switches
Idle Air Control (IAC) Motor/Valve	Engine Performance
Ignition Coil(s)	Engine Performance
Ignition Key Lock Cylinder	Anti-Theft System
Ignition Module	Engine Performance
Ignition Switch	Power Distribution; Engine Performance; Generators & Regulators; Starters
Illuminated Entry Module	Illumination/Interior Lights
Illumination Lights	Illumination/Interior Lights
Impact Sensor	Air Bag Restraint System
Inertia Fuel Shutoff Switch	Engine Performance
Inhibit Relay	Starters
Instrument Cluster	Analog Instrument Panels
Intake Air Temperature (IAT) Sensor	Engine Performance
Interior Lights	Illumination/Interior Lights
Interlock Switch	Starters
Junction Block	Power Distribution
Keyless Entry Receiver	Remote Keyless Entry
Key Reminder Switch	Starters
Knock Sensor	Engine Performance
Lamp Control Module	Exterior Lights
License Plate Lamp	Exterior Lights
Lighting Control Module	Lighting Control Modules; Anti-Theft System; Daytime Running Lights; Headlight Systems
Lower Relay	Power Convertible Top
Malfunction Indicator Light (MIL)	Engine Performance; Instrument Panels
Manifold Absolute Pressure (MAP) Sensor	Engine Performance
Mass Airflow (MAF) Sensor	Engine Performance

Mega Fuse	Generators & Regulators
Memory Seat/Mirror Module	Memory Systems
Mirror Defogger	Rear Window Defogger
Moon Roof Motor	Power Moon Roof
Moon Roof Relay	Power Moon Roof
Multi-Function Control Module	Warning Systems
Neutral Safety Switch	Starters
Oil Level Switch	Engine Performance
Oil Pressure Switch/Sending Unit	Analog Instrument Panels; Engine Performance
Overhead Console	Overhead Console
Oxygen Sensor(s) (O2S)	Engine Performance
Parking Brake Switch	Analog Instrument Panels
Park Lights	Exterior Lights
Park/Neutral Position Switch	Starters; Engine Performance; Anti-Theft System; Body Control Module
Perimeter Lighting Control Relay	Exterior Lights
Power Amplifier	Power Antennas
Power Antenna Module	Power Antennas
Power Antenna Motor	Power Antennas
Power Distribution Center	Power Distribution; Generators & Regulators; Starters
Power Door Lock Motors	Power Door Locks
Power Mirror Motors	Power Mirrors; Memory Systems
Power Sliding Door Controller	Power Sliding Side Door
Power Seat Motors	Power Seats; Memory Systems
Power Steering Pressure Switch	Engine Performance
Power Top Motor	Power Convertible Top
Power Top Relay(s)	Power Convertible Top
Powertrain Control Module	Engine Performance; Analog Instrument Panels; Cruise Control Systems; Data Link Connectors; Generators & Regulators; Starters
Power Window Motors	Power Windows
Power Window Relay(s)	Power Windows
Radiator Fan Motor(s)	Electric Cooling Fans
Radiator Fan Relay(s)	Engine Performance; Electric Cooling Fans;
Rainsense Module	Wiper/Washer Systems
Raise Relay	Power Convertible Top
Remote Anti-Theft Personality (RAP) Module	Anti-Theft System; Starters; Warning Systems
Seat Belt Pretensioners	Air Bag Restraint System
Seat Belt Retractor Solenoid	Passive Restraints
Seat Belt Switch	Air Bag Restraint System; Passive Restraints
Shift Interlock Solenoid	Shift Interlock Systems
Shift Lock Actuator	Shift Interlock Systems
Side Marker Lights	Exterior Lights

SIR Coil Assembly (Clockspring)	Air Bag Restraint System
Slip Ring (Clockspring)	Air Bag Restraint System; Steering Column Switches
SRS Control Module	Air Bag Restraint System
Starter Motor	Starters
Starter Interrupt Relay	Starters
Starter Solenoid	Starters
Starter Relay	Starters
Steering Wheel Position Sensor	Anti-Lock Brakes
Stoplights	Exterior Lights
Stoplight Switch	Engine Performance; Cruise Control Systems; Anti-Lock Brakes
Sun Roof ECU	Power Sun Roof
Sun Roof Motor	Power Sun Roof
Sun Roof Position Sensor	Power Sun Roof
Taillights	Exterior Lights
Throttle Position (TP) Sensor	Engine Performance
Torque Converter Clutch Solenoid/Switch	Engine Performance
Traction Control Switch	Anti-Lock Brakes
Trailer Tow Connector	Exterior Lights
Trailer Tow Relay	Exterior Lights
Transmission/Transaxle	Engine Performance
Transmission Control Module (TCM)	Engine Performance; Starters
Transmission Range Sensor	Starters; Back-Up Lights; Engine Performance
Transmission Range Switch	Back-Up Lights; Engine Performance; Anti-Theft System
Turn Signal Flasher	Exterior Lights
Turn Signal Lights	Exterior Lights
Twilight Sentinel Switch	Headlight Systems; Daytime Running Lights
Vapor Canister Leak Detection Pump	Engine Performance
Vehicle Control Module (VCM)	Engine Performance
Vehicle Dynamic Module	Electronic Suspension
Vehicle Speed Control Servo	Cruise Control Systems
Vehicle Speed Sensor	Data Link Connectors; Analog Instrument Panels; Cruise Control Systems; Electronic Suspension
Voltage Regulator	Generators & Regulators
Water-In-Fuel Sensor	Engine Performance; Analog Instrument Panels
Wheel Speed Sensors	Anti-Lock Brakes
Window Timer Module	Power Convertible Top
Windshield Intermittent Wiper Relay	Wiper/Washer Systems
Windshield Washer Motor	Wiper/Washer Systems
Wiper Motor	Wiper/Washer Systems

Expedition & Navigator

BUZZERS, RELAYS & TIMERS

BUZZERS, RELAYS & TIMERS LOCATION

Component	Location
Accessory Delay Relay	In smart junction box (SJB). See **Fig. 2**.
A/C Clutch Relay	In battery junction box (BJB). See **Fig. 1**.
Air Suspension Compressor Relay	In battery junction box (BJB). See **Fig. 1**.
Electronic Park Brake Release Relay	In auxiliary relay box 1. See **Fig. 3**.
Electronic Park Brake Reset Relay	In auxiliary relay box 1. See **Fig. 3**.
Front Blower Motor Relay	In battery junction box (BJB). See **Fig. 1**.
Fuel Pump Relay	In battery junction box (BJB). See **Fig. 1**.
High Intensity Discharge Headlamp Relay (Left)	In battery junction box (BJB). See **Fig. 1**.
High Intensity Discharge Headlamp Relay (Right)	In battery junction box (BJB). See **Fig. 1**.
PCM Power Relay	In battery junction box (BJB). See **Fig. 1**.
Quarter Window Close Relay	In auxiliary relay box 2. See **Fig. 4**.
Quarter Window Open Relay	In auxiliary relay box 2. See **Fig. 4**.
Rear Blower Motor Relay 1	In auxiliary relay box 2. See **Fig. 4**.
Rear Blower Motor Relay 2	In auxiliary relay box 2. See **Fig. 4**.
Rear Blower Motor Relay 3	In auxiliary relay box 2. See **Fig. 4**.
Rear Window Defrost Relay	In battery junction box (BJB). See **Fig. 1**.
Reversing Lamps Relay	In battery junction box (BJB). See **Fig. 1**.
Run/Start Relay	In battery junction box (BJB). See **Fig. 1**.
Starter Relay	In battery junction box (BJB). See **Fig. 1**.
Third Row Folding Seat Relay (Left)	In auxiliary relay box 2. See **Fig. 4**.
Third Row Folding Seat Relay (Right)	In auxiliary relay box 2. See **Fig. 4**.
Trailer Tow Relay (Battery Charge)	In battery junction box (BJB). See **Fig. 1**.
Trailer Tow Relay (Left Turn)	In battery junction box (BJB). See **Fig. 1**.
Trailer Tow Relay (Parking Lamp)	In battery junction box (BJB). See **Fig. 1**.
Trailer Tow Relay (Right Turn)	In battery junction box (BJB). See **Fig. 1**.

CIRCUIT PROTECTION DEVICES

CIRCUIT PROTECTION DEVICES LOCATION

Component	Location
A/C Clutch Diode	In battery junction box (BJB). See **Fig. 1**.
A/C Clutch Diode	In battery junction box (BJB). See **Fig. 1**.
Auxiliary Relay Box 1	Under left side of dash. See **Fig. 17**.
Auxiliary Relay Box 2 (Expedition)	Right rear corner of vehicle. See **Fig. 29**.
Auxiliary Relay Box 2 (Expedition-EL & Navigator-L)	Right rear corner of vehicle. See **Fig. 33**.
Auxiliary Relay Box 2 (Navigator)	Right rear corner of vehicle. See **Fig. 31**.

Battery Junction Box (BJB) (Expedition)	Center front of engine compartment. See **Fig. 5**.
Battery Junction Box (BJB) (Navigator)	Center front of engine compartment. See **Fig. 7**.
Fuel Pump Motor Diode	In battery junction box (BJB). See **Fig. 1**.
Fuel Pump Motor Diode	In battery junction box (BJB). See **Fig. 1**.
Fusible Link A (Expedition)	Near battery. See **Fig. 6**.
Fusible Link A (Navigator)	Near battery. See **Fig. 8**.
Fusible Link B (Expedition)	Near battery. See **Fig. 6**.
Fusible Link B (Navigator)	Near battery. See **Fig. 8**.
Fusible Link C (Expedition)	Near battery. See **Fig. 6**.
Fusible Link C (Navigator)	Near battery. See **Fig. 8**.
Fusible Link D (Expedition)	Near battery. See **Fig. 6**.
Fusible Link D (Navigator)	Near battery. See **Fig. 8**.
Smart Junction Box (SJB) (Expedition)	Behind right kick panel. See **Fig. 15**.
Smart Junction Box (SJB) (Navigator)	Behind right kick panel. See **Fig. 17**.
Start/Run Diode	In battery junction box (BJB). See **Fig. 1**.
Start/Run Diode	In battery junction box (BJB). See **Fig. 1**.

CONTROL UNITS

CONTROL UNITS LOCATION

Component	Location
ABS Control Module (Expedition)	Left side of engine compartment. See **Fig. 5**.
ABS Control Module (Navigator)	Left side of engine compartment. See **Fig. 7**.
Air Suspension Module (Expedition)	Under left end of dash. See **Fig. 6**.
Air Suspension Module (Navigator)	Under left end of dash. See **Fig. 8**.
Auxiliary Audio Module	Rear of center console. See **Fig. 23**.
Climate Controlled Seat Module (Passenger Side)	Under front passenger's seat. See **Fig. 37**.
Driver Air Bag Module	Center of steering wheel. See **Fig. 21**.
Driver Seat Module	Under driver's seat. See **Fig. 36**.
Electronic Automatic Temperature Control (ETAC) Module (Expedition)	In center of dash. See **Fig. 16**.
Electronic Automatic Temperature Control (ETAC) Module (Navigator)	In center of dash. See **Fig. 18**.
Four-Wheel Drive Control Module (Expedition)	Behind right kick panel. See **Fig. 5**.
Four-Wheel Drive Control Module (Navigator)	Behind right kick panel. See **Fig. 7**.
Fuel Pump Module (Expedition-EL & Navigator-L)	In fuel tank. See **Fig. 35**.
Fuel Pump Module (Expedition & Navigator)	In fuel tank. See **Fig. 34**.
Heater Blower Control Module	Right side of HVAC unit. See **Fig. 50**.
Manual Climate Control Module (Expedition)	Behind center of dash. See **Fig. 16**.
Parking Aid Module (PAM) (Expedition-EL & Navigator-L)	Under center rear of vehicle. See **Fig. 35**.
Parking Aid Module (PAM) (Expedition & Navigator)	Under center rear of vehicle. See **Fig. 34**.
Passenger Air Bag Module (Expedition)	Behind right side of dash. See **Fig. 16**.

Passenger Air Bag Module (Navigator)	Behind right side of dash. See **Fig. 18**.
Power Fold Running Board Module	In left "B" pillar. See **Fig. 26**.
Power Liftgate Module (Expedition)	Left side of cargo area, behind trim. See **Fig. 28**.
Power Liftgate Module (Expedition-EL & Navigator-L)	Left side of cargo area, behind trim. See **Fig. 32**.
Power Liftgate Module (Navigator)	Left side of cargo area, behind trim. See **Fig. 30**.
Powertrain Control Module (PCM) (Expedition)	Right rear of engine compartment. See **Fig. 5**.
Powertrain Control Module (PCM) (Navigator)	Right rear of engine compartment. See **Fig. 7**.
Restraints Control Module (RCM) (Expedition)	Below center console. See **Fig. 25**.
Restraints Control Module (RCM) (Navigator)	Below center console. See **Fig. 27**.
Roof Opening Panel Module (Expedition)	In roof panel. See **Fig. 46**.
Roof Opening Panel Module (Expedition-EL & Navigator-L)	In roof panel. See **Fig. 48**.
Roof Opening Panel Module (Navigator)	In roof panel. See **Fig. 47**.
Trailer Electronic Brake Control Module (Expedition)	Under center of dash. See **Fig. 15**.
Trailer Electronic Brake Control Module (Navigator)	Under left side of dash. See **Fig. 17**.

MOTORS

MOTORS LOCATION

Component	Location
Adjustable Pedal Motor (Expedition)	On accelerator pedal support. See **Fig. 15**.
Adjustable Pedal Motor (Navigator)	On accelerator pedal support. See **Fig. 17**.
Air Suspension Compressor (Expedition)	Right front of engine compartment. See **Fig. 6**.
Air Suspension Compressor (Navigator)	Right front of engine compartment. See **Fig. 8**.
Auxiliary Blower Motor (Expedition-EL & Navigator-L)	Right side of auxiliary HVAC unit. See **Fig. 52**.
Auxiliary Blower Motor (Expedition & Navigator)	Right side of auxiliary HVAC unit. See **Fig. 51**.
Blend Door Actuator (Rear) (Expedition-EL & Navigator-L)	Left side of auxiliary HVAC unit. See **Fig. 52**.
Blend Door Actuator (Rear) (Expedition & Navigator)	Center of auxiliary HVAC unit. See **Fig. 51**.
Blower Motor (Auto A/C)	Right side of HVAC unit. See **Fig. 50**.
Blower Motor (Manual A/C)	Right side of HVAC unit. See **Fig. 49**.
Driver Seat Front Height Motor	Under driver's seat. See **Fig. 36**.
Driver Seat Horizontal Motor	Under driver's seat. See **Fig. 36**.
Driver Seat Rear Height Motor	Under driver's seat. See **Fig. 36**.
Driver Seat Recliner Motor	In driver's seat seatback. See **Fig. 36**.
Electronic Throttle Control (ETC) Motor	Top rear of engine. See **Fig. 9**.
Exterior Rear View Mirror (Left Side) (Expedition)	At left rear view mirror. See **Fig. 38**.
Exterior Rear View Mirror (Left Side) (Navigator)	At left rear view mirror. See **Fig. 40**.
Exterior Rear View Mirror (Right Side) (Expedition)	At right rear view mirror. See **Fig. 39**.

Exterior Rear View Mirror (Right Side) (Navigator)	At right rear view mirror. See **Fig. 41**.
Fresh/Recirculation Door Actuator (Auto A/C)	Right side of HVAC unit. See **Fig. 50**.
Fresh/Recirculation Door Actuator (Manual A/C)	Right side of HVAC unit. See **Fig. 49**.
Liftgate Drive Motor Assembly (Expedition)	Left rear corner of vehicle. See **Fig. 28**.
Liftgate Drive Motor Assembly (Expedition-EL & Navigator-L)	Left rear corner of vehicle. See **Fig. 32**.
Liftgate Drive Motor Assembly (Navigator)	Left rear corner of vehicle. See **Fig. 30**.
Liftgate Glass Actuator (Expedition)	In liftgate. See **Fig. 44**.
Liftgate Glass Actuator (Navigator)	In liftgate. See **Fig. 45**.
Liftgate Latch (Expedition)	In liftgate. See **Fig. 44**.
Liftgate Latch (Navigator)	In liftgate. See **Fig. 45**.
Liftgate Latch/Unlatch Assembly (Expedition)	In right side of liftgate. See **Fig. 44**.
Liftgate Latch/Unlatch Assembly (Navigator)	In right side of liftgate. See **Fig. 45**.
Lumbar Motor (Driver Seat)	In driver's seat seatback. See **Fig. 36**.
Lumbar Motor (Passenger Seat)	In front passenger's seat seatback. See **Fig. 37**.
Mode Door Actuator (Auto A/C)	Left side of HVAC unit. See **Fig. 50**.
Mode Door Actuator (Manual A/C)	Left side of HVAC unit. See **Fig. 49**.
Mode Door Actuator (Rear) (Expedition-EL & Navigator-L)	Left side of HVAC unit. See **Fig. 52**.
Mode Door Actuator (Rear) (Expedition & Navigator)	Top left side of HVAC unit. See **Fig. 51**.
Passenger Seat Front Height Motor	Under front passenger's seat. See **Fig. 37**.
Passenger Seat Horizontal Motor	Under front passenger's seat. See **Fig. 37**.
Passenger Seat Rear Height Motor	Under front passenger's seat. See **Fig. 37**.
Passenger Seat Recliner Motor	In front passenger's seat seatback. See **Fig. 37**.
Power Window Motor (Driver Side Front) (Expedition)	In rear of driver's door. See **Fig. 38**.
Power Window Motor (Driver Side Front) (Navigator)	In rear of driver's door. See **Fig. 40**.
Power Window Motor (Left Rear)	In rear of left rear door. See **Fig. 42**.
Power Window Motor (Passenger Side Front) (Expedition)	In rear of front passenger's door. See **Fig. 39**.
Power Window Motor (Passenger Side Front) (Navigator)	In rear of front passenger's door. See **Fig. 41**.
Power Window Motor (Right Rear)	In rear of right rear door. See **Fig. 43**.
Quarter Window Motor (Left Rear) (Expedition)	In left "D" pillar. See **Fig. 28**.
Quarter Window Motor (Left Rear) (Expedition-EL & Navigator-L)	In left "D" pillar. See **Fig. 32**.
Quarter Window Motor (Left Rear) (Navigator)	In left "D" pillar. See **Fig. 30**.
Quarter Window Motor (Right Rear) (Expedition)	In right "D" pillar. See **Fig. 29**.
Quarter Window Motor (Right Rear) (Expedition-EL & Navigator-L)	In right "D" pillar. See **Fig. 33**.
Quarter Window Motor (Right Rear) (Navigator)	In right "D" pillar. See **Fig. 31**.
Rear Wiper Motor Assembly (Expedition)	In liftgate. See **Fig. 44**.
Rear Wiper Motor Assembly (Navigator)	In liftgate. See **Fig. 45**.

Running Board Motor (Left)	Under left side of vehicle. See **Fig. 26**.
Running Board Motor (Right)	Under right side of vehicle. See **Fig. 27**.
Starter Motor (Expedition)	Lower right side of engine. See **Fig. 5**.
Starter Motor (Navigator)	Lower right side of engine. See **Fig. 7**.
Steering Column Position Motor	Base of steering column. See **Fig. 20**.
Temperature Blend Door Actuator (Driver)	Bottom left side of HVAC unit. See **Fig. 50**.
Temperature Blend Door Actuator (Manual A/C)	Top left side of HVAC unit. See **Fig. 49**.
Temperature Blend Door Actuator (Passenger)	Top front of HVAC unit. See **Fig. 50**.
Third Row Power- Fold Seat Motor (Left) (Expedition)	Behind center of rear seat. See **Fig. 29**.
Third Row Power- Fold Seat Motor (Left) (Expedition-EL & Navigator-L)	Behind center of rear seat. See **Fig. 33**.
Third Row Power-Fold Seat Motor (Left) (Navigator)	Behind center of rear seat. See **Fig. 31**.
Third Row Power-Fold Seat Motor (Right) (Expedition)	Behind right side of rear seat. See **Fig. 29**.
Third Row Power-Fold Seat Motor (Right) (Expedition-EL & Navigator-L)	Behind right side of rear seat. See **Fig. 33**.
Third Row Power-Fold Seat Motor (Right) (Navigator)	Behind right side of rear seat. See **Fig. 31**.
Washer Pump Motor (Front & Rear) (Expedition)	Right front of engine compartment, on washer fluid reservoir. See **Fig. 6**.
Washer Pump Motor (Front & Rear) (Navigator)	Right front of engine compartment, on washer fluid reservoir. See **Fig. 8**.
Windshield Wiper Motor (Expedition)	On left side of firewall. See **Fig. 5**.
Windshield Wiper Motor (Navigator)	On left side of firewall. See **Fig. 7**.

SENDING UNITS & SENSORS

SENDING UNITS & SENSORS LOCATION

Component	Location
Accelerator Pedal Position Sensor (Expedition)	Above accelerator pedal. See **Fig. 5**.
Accelerator Pedal Position Sensor (Navigator)	Above accelerator pedal. See **Fig. 7**.
A/C Pressure Transducer Sensor (Expedition)	Right front of engine compartment. See **Fig. 6**.
A/C Pressure Transducer Sensor (Navigator)	Right front of engine compartment. See **Fig. 8**.
Ambient Air Temperature Sensor (Expedition)	Behind front of radiator grille. See **Fig. 5**.
Ambient Air Temperature Sensor (Navigator)	Behind front of radiator grille. See **Fig. 7**.
Brake Booster Sensor (Expedition)	Left rear of engine compartment. See **Fig. 5**.
Brake Booster Sensor (Navigator)	Left rear of engine compartment. See **Fig. 7**.
Camshaft Position Sensor 1	Front of right cylinder bank. See **Fig. 9**.
Camshaft Position Sensor 2	Front of left cylinder bank. See **Fig. 9**.
Crankshaft Position Sensor	Lower right front of engine. See **Fig. 10**.
Cylinder-Head Temperature Sensor	Right rear of engine. See **Fig. 10**.
Driver Memory Seat Front Height Position Sensor	Under driver's seat. See **Fig. 36**.
Driver Memory Seat Horizontal Position Sensor	Under driver's seat. See **Fig. 36**.
Driver Memory Seat Rear Height Position Sensor	Under driver's seat. See **Fig. 36**.

Evaporator Discharge Air Temperature Sensor (Auto A/C)	Top center of HVAC unit. See **Fig. 50**.
Evaporator Discharge Air Temperature Sensor (Manual A/C)	Top center of HVAC unit. See **Fig. 49**.
Front Impact Severity Sensor (Expedition)	Right front of engine compartment. See **Fig. 5**.
Front Impact Severity Sensor (Navigator)	Right front of engine compartment. See **Fig. 7**.
Fuel Tank Pressure Sensor (Expedition-EL & Navigator-L)	In fuel tank. See **Fig. 35**.
Fuel Tank Pressure Sensor (Expedition & Navigator)	In fuel tank. See **Fig. 34**.
Heated Oxygen Sensor (HO2S) #11	On right exhaust downpipe. See **Fig. 10**.
Heated Oxygen Sensor (HO2S) #12 (6HP26 2WD)	On rear of exhaust system. See **Fig. 13**.
Heated Oxygen Sensor (HO2S) #12 (6HP26 4WD)	On rear of exhaust system. See **Fig. 14**.
Heated Oxygen Sensor (HO2S) #12 (6R75 2WD)	On rear of exhaust system. See **Fig. 11**.
Heated Oxygen Sensor (HO2S) #12 (6R75 4WD)	On rear of exhaust system. See **Fig. 12**.
Heated Oxygen Sensor (HO2S) #21	On left exhaust downpipe. See **Fig. 9**.
Heated Oxygen Sensor (HO2S) #22 (6HP26 2WD)	On rear of exhaust system. See **Fig. 13**.
Heated Oxygen Sensor (HO2S) #22 (6HP26 4WD)	On rear of exhaust system. See **Fig. 14**.
Heated Oxygen Sensor (HO2S) #22 (6R75 2WD)	On rear of exhaust system. See **Fig. 11**.
Heated Oxygen Sensor (HO2S) #22 (6R75 4WD)	On rear of exhaust system. See **Fig. 12**.
Height Sensor (Left Rear) (Expedition-EL & Navigator-L)	Left rear shock tower. See **Fig. 35**.
Height Sensor (Left Rear) (Expedition & Navigator)	Left rear shock tower. See **Fig. 34**.
Height Sensor (Right Rear) (Expedition-EL & Navigator-L)	Right rear shock tower. See **Fig. 35**.
Height Sensor (Right Rear) (Expedition & Navigator)	Right rear shock tower. See **Fig. 34**.
In-Vehicle Temperature/Humidity Sensor	Behind left side of dash. See **Fig. 18**.
In-Vehicle Temperature Sensor	Behind left side of dash. See **Fig. 16**.
Knock Sensor 1	Right rear of engine. See **Fig. 10**.
Knock Sensor 2	Left rear of engine. See **Fig. 10**.
Liftgate Obstacle Detection Strip (Left) (Expedition)	Left rear corner of vehicle. See **Fig. 28**.
Liftgate Obstacle Detection Strip (Left) (Expedition-EL & Navigator-L)	Left rear corner of vehicle. See **Fig. 32**.
Liftgate Obstacle Detection Strip (Left) (Navigator)	Left rear corner of vehicle. See **Fig. 30**.
Liftgate Obstacle Detection Strip (Right) (Expedition)	Right rear corner of vehicle. See **Fig. 29**.
Liftgate Obstacle Detection Strip (Right) (Expedition-EL & Navigator-L)	Right rear corner of vehicle. See **Fig. 33**.
Liftgate Obstacle Detection Strip (Right)	

(Navigator)	Right rear corner of vehicle. See **Fig. 31**.
Mass Air Flow/Intake Air Temperature (MAF/IAT) Sensor (Expedition)	In intake system. See **Fig. 6**.
Mass Air Flow/Intake Air Temperature (MAF/IAT) Sensor (Navigator)	In intake system. See **Fig. 8**.
Safety Canopy Sensor (Driver 1) (Expedition)	In driver's door. See **Fig. 38**.
Safety Canopy Sensor (Driver 1) (Navigator)	In driver's door. See **Fig. 40**.
Safety Canopy Sensor (Driver 2) (Expedition)	Base of left "C" pillar. See **Fig. 28**.
Safety Canopy Sensor (Driver 2) (Expedition-EL & Navigator-L)	Base of left "C" pillar. See **Fig. 32**.
Safety Canopy Sensor (Driver 2) (Navigator)	Base of left "C" pillar. See **Fig. 30**.
Safety Canopy Sensor (Passenger 1) (Expedition)	In front passenger's door. See **Fig. 39**.
Safety Canopy Sensor (Passenger 1) (Navigator)	In front passenger's door. See **Fig. 41**.
Safety Canopy Sensor (Passenger 2) (Expedition)	Base of right "C" pillar. See **Fig. 29**.
Safety Canopy Sensor (Passenger 2) (Expedition-EL & Navigator-L)	Base of right "C" pillar. See **Fig. 33**.
Safety Canopy Sensor (Passenger 2) (Navigator)	Base of right "C" pillar. See **Fig. 31**.
Seat Position Sensor (Driver)	Under driver's seat. See **Fig. 36**.
Stability Control Sensor Cluster (Expedition)	Under center console. See **Fig. 16**.
Stability Control Sensor Cluster (Navigator)	Under center console. See **Fig. 18**.
Steering Position Sensor (Expedition)	On steering column. See **Fig. 19**.
Steering Position Sensor (Navigator)	On steering column. See **Fig. 20**.
Sunload Sensor	Under top center of dash. See **Fig. 17**.
Throttle Position Sensor (TPS)	On throttle body. See **Fig. 9**.
Wheel Speed Sensor (Left Front) (Expedition)	Left side of engine compartment. See **Fig. 5**.
Wheel Speed Sensor (Left Front) (Navigator)	Left side of engine compartment. See **Fig. 7**.
Wheel Speed Sensor (Left Rear) (Expedition-EL & Navigator-L)	At left rear wheel. See **Fig. 35**.
Wheel Speed Sensor (Left Rear) (Expedition & Navigator)	At left rear wheel. See **Fig. 34**.
Wheel Speed Sensor (Right Front) (Expedition)	Right side of engine compartment. See **Fig. 5**.
Wheel Speed Sensor (Right Front) (Navigator)	Right side of engine compartment. See **Fig. 7**.
Wheel Speed Sensor (Right Rear) (Expedition-EL & Navigator-L)	At right rear wheel. See **Fig. 35**.
Wheel Speed Sensor (Right Rear) (Expedition & Navigator)	At right rear wheel. See **Fig. 34**.

SOLENOIDS & SOLENOID VALVES

SOLENOIDS & SOLENOID VALVES LOCATION

Component	Location
A/C Clutch Field Coil	Right front of engine. See **Fig. 10**.
Air Spring Solenoid Valve (Left Rear) (Expedition-EL & Navigator-L)	Left rear shock tower. See **Fig. 35**.
Air Spring Solenoid Valve (Left Rear) (Expedition & Navigator)	Left rear shock tower. See **Fig. 34**.

Air Spring Solenoid Valve (Right Rear) (Expedition-EL & Navigator-L)	Right rear shock tower. See **Fig. 35**.
Air Spring Solenoid Valve (Right Rear) (Expedition & Navigator)	Right rear shock tower. See **Fig. 34**.
Auto Park Brake Release Solenoid	In driver's footwell. See **Fig. 17**.
Brake Shift Interlock (Expedition)	On steering column. See **Fig. 19**.
Charge Motion Control Valve (CMCV)	Rear of engine. See **Fig. 10**.
Door Lock Actuator (Left Front) (Expedition)	In rear of driver's door. See **Fig. 38**.
Door Lock Actuator (Left Front) (Navigator)	In rear of driver's door. See **Fig. 40**.
Door Lock Actuator (Left Rear)	In rear of left rear door. See **Fig. 42**.
Door Lock Actuator (Right Front) (Expedition)	In rear of front passenger's door. See **Fig. 39**.
Door Lock Actuator (Right Front) (Navigator)	In rear of front passenger's door. See **Fig. 41**.
Door Lock Actuator (Right Rear)	In rear of right rear door. See **Fig. 43**.
Electronic Fan Clutch (Expedition)	Top front of engine. See **Fig. 6**.
Electronic Fan Clutch (Navigator)	Top front of engine. See **Fig. 8**.
EVAP Canister Purge Valve (Expedition)	Left rear of engine compartment. See **Fig. 6**.
EVAP Canister Purge Valve (Navigator)	Left rear of engine compartment. See **Fig. 8**.
EVAP Canister Vent Solenoid (Expedition)	Under left side of vehicle. See **Fig. 24**.
EVAP Canister Vent Solenoid (Navigator)	Under left side of vehicle. See **Fig. 26**.
Fuel Injector 1	On right cylinder head. See **Fig. 9**.
Fuel Injector 2	On right cylinder head. See **Fig. 9**.
Fuel Injector 3	On right cylinder head. See **Fig. 9**.
Fuel Injector 4	On right cylinder head. See **Fig. 9**.
Fuel Injector 5	On left cylinder head. See **Fig. 10**.
Fuel Injector 6	On left cylinder head. See **Fig. 10**.
Fuel Injector 7	On left cylinder head. See **Fig. 10**.
Fuel Injector 8	On left cylinder head. See **Fig. 10**.
Headlamp Solenoid (Left) (Navigator)	Behind left headlight assembly. See **Fig. 8**.
Headlamp Solenoid (Right) (Navigator)	Behind right headlight assembly. See **Fig. 8**.
Heated Positive Crankcase Ventilation (PCV) Valve	Left rear of engine. See **Fig. 9**.
Integrated Wheel Ends Solenoid (Expedition)	Right front of engine compartment. See **Fig. 6**.
Integrated Wheel Ends Solenoid (Navigator)	Right front of engine compartment. See **Fig. 8**.
Key Release Interlock Actuator (Expedition)	On steering column. See **Fig. 19**.
Key Release Interlock Actuator (Navigator)	On steering column. See **Fig. 20**.
Variable Camshaft Timing (VCT) Valve 1	Right front of engine. See **Fig. 9**.
Variable Camshaft Timing (VCT) Valve 2	Left side of engine. See **Fig. 9**.

SWITCHES

SWITCHES LOCATION

Component	Location
Brake Fluid Level Switch (Expedition)	In brake fluid reservoir. See **Fig. 6**.
Brake Fluid Level Switch (Navigator)	In brake fluid reservoir. See **Fig. 8**.
Brake Pedal Position Switch (Expedition)	On brake pedal support. See **Fig. 6**.

Brake Pedal Position Switch (Navigator)	On brake pedal support. See **Fig. 8**.
Door Ajar Switch (Driver Side Rear)	In rear of left rear door. See **Fig. 42**.
Door Ajar Switch (Left Front) (Expedition)	In rear of driver's door. See **Fig. 38**.
Door Ajar Switch (Left Front) (Navigator)	In rear of driver's door. See **Fig. 40**.
Door Ajar Switch (Passenger Side Rear)	In rear of right rear door. See **Fig. 43**.
Door Ajar Switch (Right Front) (Expedition)	In rear of front passenger's door. See **Fig. 39**.
Door Ajar Switch (Right Front) (Navigator)	In rear of front passenger's door. See **Fig. 41**.
Horn Switch	In steering wheel. See **Fig. 21**.
Inertia Fuel Shutoff (IFS) Switch (Expedition)	Left rear corner of cargo area, behind trim. See **Fig. 28**.
Inertia Fuel Shutoff (IFS) Switch (Expedition-EL & Navigator-L)	Left rear corner of cargo area, behind trim. See **Fig. 32**.
Inertia Fuel Shutoff (IFS) Switch (Navigator)	Left rear corner of cargo area, behind trim. See **Fig. 30**.
Oil Pressure Switch	Lower left front of engine. See **Fig. 9**.
Parking Brake Switch (Expedition)	Above left kick panel. See **Fig. 24**.
Parking Brake Switch (Navigator)	Above left kick panel. See **Fig. 26**.
Safety Belt Buckle Switch (Driver)	In driver's safety belt buckle assembly. See **Fig. 36**.
Safety Belt Buckle Switch (Passenger)	In front passenger's safety belt buckle assembly. See **Fig. 37**.
Transmission Control Switch (Expedition)	On steering column. See **Fig. 19**.
Washer Fluid Level Switch (Expedition)	Right front of engine compartment, on washer fluid reservoir. See **Fig. 6**.
Washer Fluid Level Switch (Navigator)	Right front of engine compartment, on washer fluid reservoir. See **Fig. 8**.

MISCELLANEOUS

MISCELLANEOUS LOCATION

Component	Location
Adjustable Pedal Memory Potentiometer (Expedition)	Under left side of dash. See **Fig. 15**.
Adjustable Pedal Memory Potentiometer (Navigator)	Under left side of dash. See **Fig. 17**.
Antenna Module (Expedition)	Top of right "C" pillar. See **Fig. 29**.
Antenna Module (Expedition-EL & Navigator-L)	Top of right "C" pillar. See **Fig. 33**.
Antenna Module (Navigator)	Top of right "C" pillar. See **Fig. 31**.
Auxiliary Blower Motor Resistor Assembly (Expedition-EL & Navigator-L)	Right side of auxiliary HVAC unit. See **Fig. 52**.
Auxiliary Blower Motor Resistor Assembly (Expedition & Navigator)	Right side of auxiliary HVAC unit. See **Fig. 51**.
Battery (Expedition)	Right front of engine compartment. See **Fig. 5**.
Battery (Navigator)	Right front of engine compartment. See **Fig. 7**.
Blower Motor Resistor	Bottom right side of HVAC unit. See **Fig. 49**.
Climate Controlled Seat Backrest Thermo-Electric	In driver's seat seatback. See **Fig. 36**.

Device (TED) (Driver Side)	
Climate Controlled Seat Backrest Thermo-Electric Device (TED) (Passenger Side)	In front passenger's seat seatback. See **Fig. 37**.
Climate Controlled Seat Cushion Thermo-Electric Device (TED) (Driver Side)	Under driver seat. See **Fig. 36**.
Climate Controlled Seat Cushion Thermo-Electric Device (TED) (Passenger Side)	Under front passenger's seat. See **Fig. 37**.
Clockspring	In steering wheel. See **Fig. 21**.
Coil On Plug (COP) 1	On right cylinder head. See **Fig. 9**.
Coil On Plug (COP) 2	On right cylinder head. See **Fig. 9**.
Coil On Plug (COP) 3	On right cylinder head. See **Fig. 9**.
Coil On Plug (COP) 4	On right cylinder head. See **Fig. 9**.
Coil On Plug (COP) 5	On left cylinder head. See **Fig. 10**.
Coil On Plug (COP) 6	On left cylinder head. See **Fig. 10**.
Coil On Plug (COP) 7	On left cylinder head. See **Fig. 10**.
Coil On Plug (COP) 8	On left cylinder head. See **Fig. 10**.
Data Link Connector (Expedition)	Under left side of dash. See **Fig. 16**.
Data Link Connector (Navigator)	Under left side of dash. See **Fig. 18**.
Floor Shifter (Expedition)	Under center console. See **Fig. 22**.
Floor Shifter (Navigator)	Under center console. See **Fig. 23**.
Generator (Expedition)	Top front of engine. See **Fig. 6**.
Generator (Navigator)	Top front of engine. See **Fig. 8**.
GPS Antenna (Expedition)	Behind right side of dash. See **Fig. 16**.
GPS Antenna (Navigator)	Behind right side of dash. See **Fig. 18**.
Horn (Expedition)	Left front of engine compartment. See **Fig. 5**.
Horn (Navigator)	Left front of engine compartment. See **Fig. 7**.
Ignition Transformer Capacitor 1	Top right front of engine. See **Fig. 9**.
Ignition Transformer Capacitor 2	Top left front of engine. See **Fig. 10**.
Parking Aid Speaker (Expedition)	At left "C" pillar. See **Fig. 28**.
Parking Aid Speaker (Expedition-EL & Navigator-L)	At left "C" pillar. See **Fig. 32**.
Parking Aid Speaker (Navigator)	At left "C" pillar. See **Fig. 30**.
Passive Anti-Theft Transceiver (Expedition)	Top of steering column. See **Fig. 19**.
Passive Anti-Theft Transceiver (Navigator)	Top of steering column. See **Fig. 20**.
Power Liftgate Chime (Expedition)	Left rear corner of vehicle. See **Fig. 28**.
Power Liftgate Chime (Expedition-EL & Navigator-L)	Left rear corner of vehicle. See **Fig. 32**.
Power Liftgate Chime (Navigator)	Left rear corner of vehicle. See **Fig. 30**.
Safety Belt Pretensioner (Driver)	In driver's safety belt buckle assembly. See **Fig. 36**.
Safety Belt Pretensioner (Passenger)	In passenger's safety belt buckle assembly. See **Fig. 37**.
Safety Canopy (Left) (Expedition)	Top of left "C" pillar. See **Fig. 28**.
Safety Canopy (Left) (Expedition-EL & Navigator-L)	Top of left "C" pillar. See **Fig. 32**.

Safety Canopy (Left) (Navigator)	Top of left "C" pillar. See **Fig. 30**.
Safety Canopy (Right) (Expedition)	Top of right "C" pillar. See **Fig. 29**.
Safety Canopy (Right) (Expedition-EL & Navigator-L)	Top of right "C" pillar. See **Fig. 33**.
Safety Canopy (Right) (Navigator)	Top of right "C" pillar. See **Fig. 31**.
Satellite Antenna (Expedition)	Under front of center console. See **Fig. 22**.
Satellite Antenna (Navigator)	Under front of center console. See **Fig. 23**.
Satellite Radio Receiver (Expedition)	Under front of center console. See **Fig. 22**.
Satellite Radio Receiver (Navigator)	Under front of center console. See **Fig. 23**.
Side Thorax Air Bag Module (Driver)	In driver's seat seatback. See **Fig. 36**.
Side Thorax Air Bag Module (Passenger)	In front passenger's seat seatback. See **Fig. 37**.
Subwoofer Amplifier (Expedition)	Left side of cargo area, behind trim. See **Fig. 28**.
Subwoofer Amplifier (Expedition-EL & Navigator-L)	Left side of cargo area, behind trim. See **Fig. 32**.
Subwoofer Amplifier (Navigator)	Left side of cargo area, behind trim. See **Fig. 30**.
THX Amplifier	Under center of dash. See **Fig. 18**.
Trailer Tow Connector (4-Pin) (Expedition-EL & Navigator-L)	Under center of rear bumper. See **Fig. 35**.
Trailer Tow Connector (4-Pin) (Expedition & Navigator)	Under center of rear bumper. See **Fig. 34**.
Trailer Tow Connector (7-Pin) (Expedition-EL & Navigator-L)	Under center of rear bumper. See **Fig. 35**.
Trailer Tow Connector (7-Pin) (Expedition & Navigator)	Under center of rear bumper. See **Fig. 34**.
6HP26 Automatic Transmission (2WD)	Right rear of transmission. See **Fig. 13**.
6HP26 Automatic Transmission (4WD)	Right rear of transmission. See **Fig. 14**.
6R75 Automatic Transmission (2WD)	Right rear of transmission. See **Fig. 11**.
6R75 Automatic Transmission (4WD)	Right rear of transmission. See **Fig. 12**.

CONNECTORS

CONNECTORS LOCATION

Component	Location
C133 (7 Pin)	Left front of engine compartment. See **Fig. 8**.
C134 (Black, 7 Pin)	Right front of engine compartment. See **Fig. 8**.
C139 (Expedition) (Black, 34 Pin)	Left side of engine compartment. See **Fig. 6**.
C139 (Navigator) (Black, 34 Pin)	Left side of engine compartment. See **Fig. 8**.
C140 (Brown, 8 Pin)	Right front of engine. See **Fig. 8**.
C144 (Black, 4 Pin)	Right rear side of engine. See **Fig. 10**.
C145 (Expedition) (Black, 16 Pin)	Right side of engine compartment. See **Fig. 6**.
C145 (Navigator) (Black, 16 Pin)	Right side of engine compartment. See **Fig. 8**.
C146 (Expedition) (Black, 34 Pin)	Right side of engine compartment. See **Fig. 6**.
C146 (Navigator) (Black, 34 Pin)	Right side of engine compartment. See **Fig. 8**.
C192 (Expedition) (Black, 4 Pin)	Right front of engine compartment. See **Fig. 5**.
C192 (Navigator) (Black, 4 Pin)	Right front of engine compartment. See **Fig. 7**.

C210 (Expedition) (White, 20 Pin)	Behind right end of dash. See **Fig. 15**.
C210 (Navigator) (White, 20 Pin)	Behind right end of dash. See **Fig. 17**.
C211 (Expedition) (Black, 30 Pin)	Behind right end of dash. See **Fig. 25**.
C211 (Navigator) (Black, 30 Pin)	Behind right end of dash. See **Fig. 27**.
C212 (Expedition) (Gray, 13 Pin)	Behind left kick panel. See **Fig. 24**.
C212 (Navigator) (Gray, 13 Pin)	Behind left kick panel. See **Fig. 26**.
C213 (Expedition) (Green, 20 Pin)	Behind left kick panel. See **Fig. 15**.
C213 (Navigator) (Green, 20 Pin)	Behind left kick panel. See **Fig. 17**.
C214 (Expedition) (Green, 20 Pin)	Behind right end of dash. See **Fig. 15**.
C214 (Navigator) (Green, 20 Pin)	Behind right end of dash. See **Fig. 17**.
C219 (Expedition) (Gray, 6 Pin)	Behind left side of dash. See **Fig. 15**.
C219 (Navigator) (Gray, 6 Pin)	Behind left side of dash. See **Fig. 17**.
C237 (Black, 12 Pin)	Right side of HVAC unit. See **Fig. 49**.
C238 (Expedition) (Gray, 66 Pin)	Behind left kick panel. See **Fig. 24**.
C238 (Navigator) (Gray, 66 Pin)	Behind left kick panel. See **Fig. 17**.
C248 (Expedition) (Black, 12 Pin)	Behind left kick panel. See **Fig. 24**.
C248 (Navigator) (Black, 12 Pin)	Behind left kick panel. See **Fig. 26**.
C291 (Auto A/C) (Gray, 12 Pin)	Right side of HVAC unit. See **Fig. 50**.
C291 (navigator) (Gray, 12 Pin)	Behind right side of dash. See **Fig. 17**.
C298 (Expedition) (Gray, 16 Pin)	Behind right end of dash. See **Fig. 15**.
C298 (Navigator) (Gray, 16 Pin)	Behind right end of dash. See **Fig. 17**.
C299 (Auto A/C) (Black, 8 Pin)	Right side of HVAC unit. See **Fig. 50**.
C299 (Manual A/C) (Black, 8 Pin)	Right side of HVAC unit. See **Fig. 49**.
C311 (Black, 30 Pin)	Under driver' seat. See **Fig. 36**.
C312 (White, 40 Pin)	Under driver's seat. See **Fig. 36**.
C314 (Expedition) (Black, 42 Pin)	Under front of center console. See **Fig. 22**.
C314 (Navigator) (Black, 42 Pin)	Under front of center console. See **Fig. 23**.
C315 (Expedition) (Green, 20 Pin)	Below center console. See **Fig. 22**.
C315 (Navigator) (Green, 20 Pin)	Below center console. See **Fig. 23**.
C316 (Black, 30 Pin)	Under front passenger's seat. See **Fig. 37**.
C327 (Black, 14 Pin)	Under driver's seat. See **Fig. 36**.
C328 (Black, 14 Pin)	Under front passenger's seat. See **Fig. 37**.
C405 (Expedition-EL & Navigator-L) (Gray, 12 Pin)	At left "C" pillar. See **Fig. 32**.
C405 (Expedition) (Gray, 12 Pin)	At left "C" pillar. See **Fig. 28**.
C405 (Navigator) (Gray, 12 Pin)	At left "C" pillar. See **Fig. 30**.
C406 (Expedition) (Black, 12 Pin)	Top of left "D" pillar. See **Fig. 28**.
C406 (Expedition-EL & Navigator-L) (Black, 12 Pin)	Top of left "D" pillar. See **Fig. 32**.
C406 (Navigator) (Black, 12 Pin)	Top of left "D" pillar. See **Fig. 30**.
C408 (Gray, 13 Pin)	Top right side of HVAC unit. See **Fig. 52**.
C410 (Expedition) (Black, 16 Pin)	Right side of cargo area, behind trim. See **Fig. 29**.
C410 (Expedition-EL & Navigator-L) (Black, 16 Pin)	Right side of cargo area, behind trim. See **Fig. 33**.
C410 (Navigator) (Black, 16 Pin)	Right side of cargo area, behind trim. See **Fig. 31**.

C411 (Expedition) (Black, 12 Pin)	Right side of cargo area, behind trim. See **Fig. 29**.
C411 (Expedition-EL & Navigator-L) (Black, 12 Pin)	Right side of cargo area, behind trim. See **Fig. 33**.
C411 (Navigator) (Black, 12 Pin)	Right side of cargo area, behind trim. See **Fig. 31**.
C423 (Expedition) (Black, 2 Pin)	Under center of vehicle. See **Fig. 24**.
C423 (Navigator) (Black, 2 Pin)	Under center of vehicle. See **Fig. 26**.
C431 (Gray, 2 Pin)	Center rear of loading space. See **Fig. 33**.
C432 (Gray, 2 Pin)	Right rear of loading space. See **Fig. 33**.
C465 (Expedition-EL & Navigator-L) (Green, 20 Pin)	At left "C" pillar. See **Fig. 32**.
C465 (Expedition) (Green, 20 Pin)	At left "C" pillar. See **Fig. 28**.
C465 (Navigator) (Green, 20 Pin)	At left "C" pillar. See **Fig. 30**.
C494 (Expedition) (Black, 8 Pin)	Left rear corner of vehicle. See **Fig. 28**.
C494 (Expedition-EL & Navigator-L) (Black, 8 Pin)	Left rear corner of vehicle. See **Fig. 32**.
C494 (Navigator) (Black, 8 Pin)	Left rear corner of vehicle. See **Fig. 30**.
C495 (Expedition) (Black, 4 Pin)	In liftgate. See **Fig. 44**.
C495 (Navigator) (Black, 4 Pin)	In liftgate. See **Fig. 45**.
C510 (Expedition) (Black, 16 Pin)	In driver's door. See **Fig. 38**.
C510 (Navigator) (Black, 16 Pin)	In driver's door. See **Fig. 40**.
C610 (Expedition) (Black, 16 Pin)	In front passenger's door. See **Fig. 39**.
C610 (Navigator) (Black, 16 Pin)	In front passenger's door. See **Fig. 41**.
C700 (Black, 12 Pin)	In left rear door. See **Fig. 42**.
C800 (Black, 12 Pin)	In right rear door. See **Fig. 43**.
C913 (Expedition) (Black, 34 Pin)	Top of left "C" pillar. See **Fig. 28**.
C913 (Expedition-EL & Navigator-L) (Black, 34 Pin)	Top of left "C" pillar. See **Fig. 32**.
C913 (Navigator) (Black, 34 Pin)	Top of left "C" pillar. See **Fig. 30**.
C922 (Expedition-EL & Navigator-L) (Gray, 6 Pin)	Center of roof. See **Fig. 48**.
C922 (Expedition) (Gray, 6 Pin)	Center of roof. See **Fig. 46**.
C922 (Navigator) (Gray, 6 Pin)	Center of roof. See **Fig. 47**.
C934 (Expedition-EL & Navigator-L) (Gray, 10 Pin)	Left rear of roof. See **Fig. 32**.
C934 (Expedition) (Gray, 10 Pin)	Left rear of roof. See **Fig. 28**.
C934 (Navigator) (Gray, 10 Pin)	Left rear of roof. See **Fig. 30**.
C935 (Expedition) (Black, 8 Pin)	Left rear of roof. See **Fig. 28**.
C935 (Expedition-EL & Navigator-L) (Black, 8 Pin)	Left rear of roof. See **Fig. 32**.
C935 (Navigator) (Black, 8 Pin)	Left rear of roof. See **Fig. 30**.
C991 (Expedition-EL & Navigator-L) (Gray, 8 Pin)	Left rear of roof. See **Fig. 32**.
C991 (Expedition) (Gray, 8 Pin)	Left rear of roof. See **Fig. 28**.
C991 (Navigator) (Gray, 8 Pin)	Left rear of roof. See **Fig. 30**.
C1026 (Expedition) (Black, 1 Pin)	Right side of engine compartment. See **Fig. 5**.

C1026 (Navigator) (Black, 1 Pin)	Right side of engine compartment. See **Fig. 7**.
C2239 (Gray, 8 Pin)	On steering column. See **Fig. 19**.
C3049 (Yellow, 2 Pin)	Under driver's seat. See **Fig. 36**.
C3050 (Yellow, 2 Pin)	Under front passenger's seat. See **Fig. 37**.
C3051 (Yellow, 2 Pin)	Under driver's seat. See **Fig. 36**.
C3052 (Yellow, 2 Pin)	Under front passenger's seat. See **Fig. 37**.

GROUNDS

GROUNDS LOCATION

Component	Location
G100 (Expedition)	Right side of engine compartment. See **Fig. 5**.
G100 (Navigator)	Right side of engine compartment. See **Fig. 7**.
G101 (Expedition)	Near right side of radiator. See **Fig. 6**.
G101 (Navigator)	Near right side of radiator. See **Fig. 8**.
G102 (Expedition)	Right rear of engine compartment. See **Fig. 6**.
G102 (Navigator)	Right rear of engine compartment. See **Fig. 8**.
G103 (Expedition)	Left front of engine compartment. See **Fig. 5**.
G103 (Navigator)	Left front of engine compartment. See **Fig. 7**.
G104 (Expedition)	Left front of engine compartment. See **Fig. 5**.
G104 (Navigator)	Left front of engine compartment. See **Fig. 7**.
G105 (Expedition)	Right front of engine compartment. See **Fig. 6**.
G105 (Navigator)	Right front of engine compartment. See **Fig. 7**.
G106 (Expedition)	Right front of engine compartment. See **Fig. 5**.
G106 (Navigator)	Right front of engine compartment. See **Fig. 7**.
G107 (Expedition)	Right rear of engine compartment. See **Fig. 6**.
G107 (Navigator)	Right rear of engine compartment. See **Fig. 8**.
G108 (Expedition)	Right rear of engine compartment. See **Fig. 6**.
G108 (Navigator)	Right rear of engine compartment. See **Fig. 8**.
G109	Rear of right cylinder bank. See **Fig. 10**.
G110	Front of engine. See **Fig. 10**.
G200 (Expedition)	Behind right kick panel. See **Fig. 16**.
G200 (Navigator)	Behind right kick panel. See **Fig. 18**.
G201 (Expedition)	Under center of dash. See **Fig. 15**.
G201 (Navigator)	Behind center of dash. See **Fig. 17**.
G202 (Expedition)	Under center of dash. See **Fig. 15**.
G202 (Navigator)	Behind center of dash. See **Fig. 17**.
G203 (Expedition)	Behind left kick panel. See **Fig. 24**.
G203 (Navigator)	Behind left kick panel. See **Fig. 26**.
G204 (Expedition)	Behind left kick panel. See **Fig. 24**.
G204 (Navigator)	Behind left kick panel. See **Fig. 26**.
G205 (Expedition)	Under left end of dash. See **Fig. 15**.
G205 (Navigator)	Under left end of dash. See **Fig. 17**.
G300 (Expedition)	Behind right kick panel. See **Fig. 25**.

G300 (Navigator)	Behind right kick panel. See **Fig. 27**.
G301 (Expedition)	On left "B" pillar. See **Fig. 24**.
G301 (Navigator)	On left "B" pillar. See **Fig. 26**.
G302 (Expedition)	Behind right kick panel. See **Fig. 25**.
G302 (Navigator)	Behind right kick panel. See **Fig. 27**.
G400 (Expedition)	Under left quarter window. See **Fig. 28**.
G400 (Expedition-EL & Navigator-L)	Under left quarter window. See **Fig. 32**.
G400 (Navigator)	Under left quarter window. See **Fig. 30**.
G401 (Expedition)	Under left quarter window. See **Fig. 28**.
G401 (Expedition-EL & Navigator-L)	Under left quarter window. See **Fig. 32**.
G401 (Navigator)	Under left quarter window. See **Fig. 30**.
G402 (Expedition)	Right rear corner of vehicle. See **Fig. 29**.
G402 (Expedition-EL & Navigator-L)	Right rear corner of vehicle. See **Fig. 33**.
G402 (Navigator)	Left rear corner of vehicle. See **Fig. 31**.
G403 (Expedition)	Right rear corner of vehicle. See **Fig. 29**.
G403 (Expedition-EL & Navigator-L)	Right rear corner of vehicle. See **Fig. 33**.
G403 (Navigator)	Left rear corner of vehicle. See **Fig. 31**.
G404 (Expedition-EL & Navigator-L)	Under left rear of vehicle. See **Fig. 35**.
G404 (Expedition & Navigator)	Under left rear of vehicle. See **Fig. 34**.
G405 (Expedition-EL & Navigator-L)	Under left rear of vehicle. See **Fig. 35**.
G405 (Expedition & Navigator)	Under left rear of vehicle. See **Fig. 34**.

SPLICES

SPLICES LOCATION

S100 (Expedition)	In engine control sensor harness, near breakout to C211. See **Fig. 5**.
S100 (Navigator)	In engine control sensor harness, near breakout to C211. See **Fig. 7**.
S101 (Expedition)	In engine control sensor harness, near breakout to powertrain control module. See **Fig. 6**.
S101 (Navigator)	In engine control sensor harness, near breakout to powertrain control module. See **Fig. 8**.
S102 (Expedition)	In engine control sensor harness, near breakout to powertrain control module. See **Fig. 6**.
S102 (Navigator)	In engine control sensor harness, near breakout to powertrain control module. See **Fig. 8**.
S103 (Expedition)	In engine control sensor harness, near breakout to powertrain control module. See **Fig. 6**.
S103 (Navigator)	In engine control sensor harness, near breakout to powertrain control module. See **Fig. 8**.
S104 (Expedition)	In engine control sensor harness, near breakout to C140. See **Fig. 6**.
S104 (Navigator)	In engine control sensor harness, near breakout to C140. See **Fig. 8**.

S105 (Expedition)	In engine control sensor harness, near breakout to C140. See **Fig. 6**.
S105 (Navigator)	In engine control sensor harness, near breakout to C140. See **Fig. 8**.
S106 (Expedition)	In engine control sensor harness, near breakout to left front wheel speed sensor. See **Fig. 6**.
S106 (Navigator)	In engine control sensor harness, near breakout to left front wheel speed sensor. See **Fig. 8**.
S107 (Expedition)	In engine control sensor harness, near breakout to battery junction box. See **Fig. 5**.
S107 (Navigator)	In engine control sensor harness, near breakout to battery junction box. See **Fig. 7**.
S108 (Expedition)	In engine control sensor harness, near breakout to washer fluid switch. See **Fig. 6**.
S108 (Navigator)	In engine control sensor harness, near breakout to washer fluid switch. See **Fig. 8**.
S109 (Expedition)	In engine control sensor harness, near breakout to battery junction box. See **Fig. 6**.
S109 (Navigator)	In engine control sensor harness, near breakout to battery junction box. See **Fig. 8**.
S110 (Expedition)	In engine control sensor harness, near breakout to battery junction box. See **Fig. 6**.
S110 (Navigator)	In engine control sensor harness, near breakout to battery junction box. See **Fig. 8**.
S111 (Expedition)	In engine control sensor harness, near breakout to battery junction box. See **Fig. 6**.
S111 (Navigator)	In engine control sensor harness, near breakout to battery junction box. See **Fig. 8**.
S112 (Expedition)	In engine control sensor harness, near breakout to battery junction box. See **Fig. 6**.
S112 (Navigator)	In engine control sensor harness, near breakout to battery junction box. See **Fig. 8**.
S113 (Expedition)	In engine control sensor harness, near breakout to battery junction box. See **Fig. 6**.
S113 (Navigator)	In engine control sensor harness, near breakout to battery junction box. See **Fig. 8**.
S114 (Expedition)	In engine control sensor harness, under battery junction box. See **Fig. 6**.
S114 (Navigator)	In engine control sensor harness, under battery junction box. See **Fig. 8**.
S115 (Expedition)	In engine control sensor harness, under battery junction box. See **Fig. 6**.
S115 (Navigator)	In engine control sensor harness, under battery junction box. See **Fig. 8**.
S116 (Expedition)	In engine control sensor harness, under battery junction box. See **Fig. 6**.
S116 (Navigator)	In engine control sensor harness, under battery junction box. See **Fig. 8**.

S117 (Expedition)	In engine control sensor harness, under battery junction box. See **Fig. 6**.
S117 (Navigator)	In engine control sensor harness, under battery junction box. See **Fig. 8**.
S118 (Expedition)	In engine control sensor harness, under battery junction box. See **Fig. 6**.
S118 (Navigator)	In engine control sensor harness, under battery junction box. See **Fig. 8**.
S119 (Expedition)	In engine control sensor harness, under battery junction box. See **Fig. 6**.
S119 (Navigator)	In engine control sensor harness, under battery junction box. See **Fig. 8**.
S120 (Expedition)	In engine control sensor harness, under battery junction box. See **Fig. 6**.
S120 (Navigator)	In engine control sensor harness, under battery junction box. See **Fig. 8**.
S121 (Expedition)	In engine control sensor harness, under battery junction box. See **Fig. 6**.
S121 (Navigator)	In engine control sensor harness, under battery junction box. See **Fig. 8**.
S122 (Expedition)	In engine control sensor harness, near breakout to horn. See **Fig. 6**.
S122 (Navigator)	In engine control sensor harness, near breakout to horn. See **Fig. 8**.
S123 (Expedition)	In engine control sensor harness, near breakout to left front foglight. See **Fig. 6**.
S123 (Navigator)	In engine control sensor harness, near breakout to left front foglight. See **Fig. 8**.
S124 (Expedition)	In engine control sensor harness, near breakout to left front foglight. See **Fig. 6**.
S124 (Navigator)	In engine control sensor harness, near breakout to left front foglight. See **Fig. 8**.
S125 (Expedition)	In engine control sensor harness, near breakout to left front side light. See **Fig. 6**.
S125 (Navigator)	In engine control sensor harness, near breakout to left front side light. See **Fig. 8**.
S126 (Expedition)	In engine control sensor harness, near breakout to left front side light. See **Fig. 6**.
S126 (Navigator)	In engine control sensor harness, near breakout to left front side light. See **Fig. 8**.
S127 (Expedition)	In engine control sensor harness, near breakout to brake fluid level switch. See **Fig. 5**.
S127 (Navigator)	In engine control sensor harness, near breakout to brake fluid level switch. See **Fig. 7**.
S128 (Expedition)	In engine control sensor harness, near breakout to brake fluid level switch. See **Fig. 5**.
S128 (Navigator)	In engine control sensor harness, near breakout to brake fluid level switch. See **Fig. 7**.

S129 (Expedition)	In engine control sensor harness, near breakout to left front wheel speed sensor. See **Fig. 6**.
S129 (Navigator)	In engine control sensor harness, near breakout to left front wheel speed sensor. See **Fig. 8**.
S130 (Expedition)	In engine control sensor harness, near breakout to left front wheel speed sensor. See **Fig. 6**.
S130 (Navigator)	In engine control sensor harness, near breakout to left front wheel speed sensor. See **Fig. 8**.
S131 (Expedition)	In engine control sensor harness, near breakout to EVAP canister purge valve. See **Fig. 6**.
S131 (Navigator)	In engine control sensor harness, near breakout to EVAP canister purge valve. See **Fig. 8**.
S132 (Expedition)	In engine control sensor harness, near breakout to windshield wiper motor assembly. See **Fig. 5**.
S132 (Navigator)	In engine control sensor harness, near breakout to windshield wiper motor assembly. See **Fig. 7**.
S133 (Expedition)	In engine control sensor harness, near breakout to C212. See **Fig. 5**.
S133 (Navigator)	In engine control sensor harness, near breakout to C212. See **Fig. 7**.
S135	In headlights harness, in breakout to C133. See **Fig. 9**.
S136	In engine control sensor & fuel charge harness, near breakout to fuel injector 7. See **Fig. 9**.
S137	In engine control sensor & fuel charge harness, near breakout to charge motion control valve. See **Fig. 10**.
S138	In engine control sensor & fuel charge harness, near breakout to heated oxygen sensor #11. See **Fig. 10**.
S139	In engine control sensor & fuel charge harness, near breakout to powertrain control module. See **Fig. 9**.
S140	In engine control sensor & fuel charge harness, near breakout to C145. See **Fig. 10**.
S141	In engine control sensor & fuel charge harness, near breakout to powertrain control module. See **Fig. 10**.
S142	In engine control sensor & fuel charge harness, near breakout to fuel injector 3. See **Fig. 10**.
S143	In engine control sensor & fuel charge harness, near breakout to fuel injector 3. See **Fig. 9**.
S144 (Expedition)	In alternator rectifier system harness, near breakout to battery. See **Fig. 6**.
S144 (Navigator)	In alternator rectifier system harness, near breakout to battery. See **Fig. 8**.
S145 (Expedition)	In alternator rectifier system harness, near breakout to battery. See **Fig. 6**.

S145 (Navigator)	In alternator rectifier system harness, near breakout to battery. See **Fig. 8**.
S146 (Expedition)	In alternator rectifier system harness, near breakout to battery. See **Fig. 6**.
S146 (Navigator)	In alternator rectifier system harness, near breakout to battery. See **Fig. 8**.
S147	In headlights harness, in breakout to C133. See **Fig. 8**.
S148	In headlights harness, in breakout to C134. See **Fig. 8**.
S149 (6HP26 2WD)	In back-up light switch to rear light feed harness, near breakout to C146. See **Fig. 13**.
S149 (6HP26 4WD)	In back-up light switch to rear light feed harness, near breakout to C146. See **Fig. 14**.
S149 (6R75 2WD)	In back-up light switch to rear light feed harness, near breakout to C146. See **Fig. 11**.
S149 (6R75 4WD)	In back-up light switch to rear light feed harness, near breakout to C146. See **Fig. 12**.
S150 (6HP26 2WD)	In back-up light switch to rear light feed harness, near breakout to C146. See **Fig. 13**.
S150 (6HP26 4WD)	In back-up light switch to rear light feed harness, near breakout to C146. See **Fig. 14**.
S150 (6R75 2WD)	In back-up light switch to rear light feed harness, near breakout to C146. See **Fig. 11**.
S150 (6R75 4WD)	In back-up light switch to rear light feed harness, near breakout to C146. See **Fig. 12**.
S151 (6HP26 2WD)	In back-up light switch to rear light feed harness, near breakout to heated oxygen sensor #12. See **Fig. 13**.
S151 (6HP26 4WD)	In back-up light switch to rear light feed harness, near breakout to heated oxygen sensor #12. See **Fig. 14**.
S151 (6R75 2WD)	In back-up light switch to rear light feed harness, near breakout to heated oxygen sensor #12. See **Fig. 11**.
S151 (6R75 4WD)	In back-up light switch to rear light feed harness, near breakout to heated oxygen sensor #12. See **Fig. 12**.
S152 (6HP26 2WD)	In back-up light switch to rear light feed harness, near breakout to heated oxygen sensor #12. See **Fig. 13**.
S152 (6HP26 4WD)	In back-up light switch to rear light feed harness, near breakout to heated oxygen sensor #12. See **Fig. 14**.
S152 (6R75 2WD)	In back-up light switch to rear light feed harness, near breakout to heated oxygen sensor #12. See **Fig. 11**.
	In back-up light switch to rear light feed harness

S152 (6R75 4WD)	near breakout to heated oxygen sensor #12. See **Fig. 12**.
S153 (6HP26 2WD)	In back-up light switch to rear light feed harness, near breakout to 6HP26 automatic transmission. See **Fig. 13**.
S153 (6HP26 4WD)	In back-up light switch to rear light feed harness, near breakout to 6HP26 automatic transmission. See **Fig. 14**.
S153 (6R75 2WD)	In back-up light switch to rear light feed harness, near breakout to 6R75 automatic transmission. See **Fig. 11**.
S153 (6R75 4WD)	In back-up light switch to rear light feed harness, near breakout to 6R75 automatic transmission. See **Fig. 12**.
S154 (Expedition)	In engine control sensor harness, near breakout to powertrain control module. See **Fig. 6**.
S154 (Navigator)	In engine control sensor harness, near breakout to powertrain control module. See **Fig. 8**.
S155 (Expedition)	In engine control sensor harness, near breakout to powertrain control module. See **Fig. 6**.
S155 (Navigator)	In engine control sensor harness, near breakout to powertrain control module. See **Fig. 8**.
S156 (Expedition)	In engine control sensor harness, under battery junction box. See **Fig. 6**.
S156 (Navigator)	In engine control sensor harness, under battery junction box. See **Fig. 8**.
S200 (Expedition)	In engine control sensor harness, near breakout to C211. See **Fig. 5**.
S200 (Navigator)	In engine control sensor harness, near breakout to C211. See **Fig. 7**.
S201 (Expedition)	In engine control sensor harness, near breakout to C211. See **Fig. 5**.
S201 (Navigator)	In engine control sensor harness, near breakout to C211. See **Fig. 7**.
S202 (Expedition)	In engine control sensor harness, near breakout to C211. See **Fig. 5**.
S202 (Navigator)	In engine control sensor harness, near breakout to C211. See **Fig. 7**.
S203 (Expedition)	In engine control sensor harness, in breakout to air suspension module. See **Fig. 5**.
S203 (Navigator)	In engine control sensor harness, in breakout to air suspension module. See **Fig. 7**.
S204 (Expedition)	In body main harness, in breakout to C211. See **Fig. 25**.
S204 (Navigator)	In body main harness, in breakout to C211. See **Fig. 27**.
S205 (Expedition)	In body main harness, near breakout to smart junction box. See **Fig. 25**.

S205 (Navigator)	In body main harness, near breakout to smart junction box. See **Fig. 27**.
S206 (Expedition)	In body main harness, near breakout to C214. See **Fig. 25**.
S206 (Navigator)	In body main harness, near breakout to C211. See **Fig. 27**.
S207 (Expedition)	In body main harness, near breakout to smart junction box. See **Fig. 25**.
S207 (Navigator)	In body main harness, near breakout to smart junction box. See **Fig. 27**.
S208 (Expedition)	In body main harness, near breakout to smart junction box. See **Fig. 25**.
S208 (Navigator)	In body main harness, near breakout to smart junction box. See **Fig. 27**.
S209 (Expedition)	In body main harness, near breakout to smart junction box. See **Fig. 25**.
S209 (Navigator)	In body main harness, near breakout to smart junction box. See **Fig. 27**.
S210 (Expedition)	In body main harness, near breakout to smart junction box. See **Fig. 25**.
S210 (Navigator)	In body main harness, near breakout to smart junction box. See **Fig. 27**.
S211 (Expedition)	In body main harness, near breakout to smart junction box. See **Fig. 25**.
S211 (Navigator)	In body main harness, near breakout to smart junction box. See **Fig. 27**.
S212 (Expedition)	In body main harness, near breakout to G203. See **Fig. 24**.
S212 (Navigator)	In body main harness, near breakout to G203. See **Fig. 26**.
S213 (Expedition)	In body main harness, near breakout to G203. See **Fig. 24**.
S213 (Navigator)	In body main harness, near breakout to G203. See **Fig. 26**.
S214 (Expedition)	In body main harness, near breakout to parking brake switch. See **Fig. 24**.
S214 (Navigator)	In body main harness, near breakout to C238. See **Fig. 26**.
S215	In body main harness, near breakout to left side exterior rearview mirror. See **Fig. 38**.
S216	In body main harness, near breakout to C212. See **Fig. 24**.
S217	In front heater blower motor harness, near breakout to C299. See **Fig. 50**.
S218	In front heater blower motor harness, near breakout to C237. See **Fig. 49**.
S219 (Auto A/C)	In front heater blower motor harness, near breakout to passenger temperature blend door

	actuator. See **Fig. 50**.
S219 (Manual A/C)	In front heater blower motor harness, near breakout to temperature blend door actuator. See **Fig. 49**.
S220 (Auto A/C)	In front heater blower motor harness, near breakout to driver temperature blend door actuator. See **Fig. 50**.
S220 (Manual A/C)	In front heater blower motor harness, in breakout to mode door actuator. See **Fig. 49**.
S221 (Expedition)	In main harness, near breakout to C210. See **Fig. 16**.
S221 (Navigator)	In main harness, near breakout to C210. See **Fig. 18**.
S222 (Expedition)	In main harness, near breakout to glove box light. See **Fig. 16**.
S222 (Navigator)	In main harness, near breakout to glove box light. See **Fig. 18**.
S223 (Expedition)	In main harness, near breakout to glove box light. See **Fig. 16**.
S223 (Navigator)	In main harness, near breakout to glove box light. See **Fig. 18**.
S224 (Expedition)	In main harness, near breakout to passenger air bag module. See **Fig. 16**.
S224 (Navigator)	In main harness, near breakout to passenger air bag module. See **Fig. 18**.
S225 (Expedition)	In main harness, near breakout to passenger air bag module. See **Fig. 16**.
S225 (Navigator)	In main harness, near breakout to passenger air bag module. See **Fig. 18**.
S226	In main harness, near breakout to message center switch. See **Fig. 18**.
S227 (Expedition)	In main harness, near breakout to passenger air bag module. See **Fig. 16**.
S227 (Navigator)	In main harness, near breakout to passenger air bag module. See **Fig. 18**.
S228 (Expedition)	In main harness, near breakout to instrument panel power point. See **Fig. 16**.
S228 (Navigator)	In main harness, near breakout to clock. See **Fig. 17**.
S231 (Expedition)	In main harness, near breakout to audio unit. See **Fig. 15**.
S231 (Navigator)	In main harness, near breakout to sunload sensor. See **Fig. 17**.
S232 (Expedition)	In main harness, near breakout to sunload sensor. See **Fig. 15**.
S232 (Navigator)	In main harness, near breakout to clock. See **Fig. 17**.
	In main harness, near breakout to instrument

S233	cluster. See **Fig. 15**.
S234 (Expedition)	In main harness, near breakout to audio unit. See **Fig. 15**.
S234 (Navigator)	In main harness, near breakout to sunload sensor. See **Fig. 17**.
S235 (Expedition)	In main harness, near breakout to audio unit. See **Fig. 15**.
S235 (Navigator)	In main harness, near breakout to sunload sensor. See **Fig. 17**.
S236	In main harness, near breakout to sunload sensor. See **Fig. 17**.
S237	In main harness, near breakout to THX amplifier. See **Fig. 17**.
S238	In main harness, near breakout to THX amplifier. See **Fig. 17**.
S239	In main harness, near breakout to THX amplifier. See **Fig. 17**.
S240	In main harness, near breakout to THX amplifier. See **Fig. 17**.
S241 (Expedition)	In main harness, near breakout to audio unit. See **Fig. 15**.
S241 (Navigator)	In main harness, near breakout to clock. See **Fig. 17**.
S242 (Expedition)	In main harness, near breakout to audio unit. See **Fig. 15**.
S242 (Navigator)	In main harness, near breakout to clock. See **Fig. 17**.
S243	In main harness, near breakout to audio unit. See **Fig. 17**.
S244	In main harness, near breakout to audio unit. See **Fig. 17**.
S245 (Expedition)	In main harness, near breakout to four-wheel drive switch. See **Fig. 16**.
S245 (Navigator)	In main harness, near breakout to in-vehicle temperature/humidity sensor. See **Fig. 18**.
S246	In main harness, near breakout to audio unit. See **Fig. 17**.
S247	In main harness, near breakout to audio unit. See **Fig. 17**.
S248	In main harness, near breakout to instrument cluster. See **Fig. 15**.
S249	In main harness, near breakout to instrument cluster. See **Fig. 15**.
S250 (Expedition)	In main harness, near breakout to instrument cluster. See **Fig. 15**.
S250 (Navigator)	In main harness, near breakout to instrument cluster. See **Fig. 17**.
	In main harness, near breakout to instrument

S251 (Expedition)	cluster. See **Fig. 15**.
S251 (Navigator)	In main harness, near breakout to instrument cluster. See **Fig. 17**.
S252 (Expedition)	In main harness, near breakout to instrument cluster. See **Fig. 15**.
S252 (Navigator)	In main harness, near breakout to instrument cluster. See **Fig. 17**.
S253 (Expedition)	In main harness, near breakout to instrument cluster. See **Fig. 15**.
S253 (Navigator)	In main harness, near breakout to instrument cluster. See **Fig. 17**.
S254 (Expedition)	In main harness, near breakout to instrument cluster. See **Fig. 15**.
S254 (Navigator)	In main harness, near breakout to instrument cluster. See **Fig. 17**.
S255	In main harness, near breakout to auxiliary relay box 1. See **Fig. 20**.
S256	In main harness, near breakout to auxiliary relay box 1. See **Fig. 20**.
S257 (Expedition)	In main harness, near breakout to ignition switch. See **Fig. 19**.
S257 (Navigator)	In main harness, near breakout to auxiliary relay box 1. See **Fig. 20**.
S258 (Expedition) (Early Production)	In main harness, near breakout to C238. See **Fig. 16**.
S258 (Expedition) (Late Production)	In main harness, near breakout to sunload sensor. See **Fig. 16**.
S258 (Navigator) (Early Production)	In main harness, near breakout to clock. See **Fig. 17**.
S258 (Navigator) (Late Production)	In main harness, near breakout to clock. See **Fig. 17**.
S259 (Expedition)	In main harness, near breakout to C238. See **Fig. 16**.
S259 (Navigator)	In main harness, near breakout to C238. See **Fig. 17**.
S260 (Expedition)	In main harness, near breakout to headlight switch. See **Fig. 15**.
S260 (Navigator)	In main harness, near breakout to headlight switch. See **Fig. 17**.
S261 (Expedition)	In main harness, near breakout to C238. See **Fig. 15**.
S261 (Navigator)	In main harness, near breakout to C238. See **Fig. 17**.
S262	In main harness, near breakout to C238. See **Fig. 17**.
S263	In main harness, near breakout to C238. See **Fig. 17**.
	In main harness, near breakout to C238. See **Fig**

S264	**17**.
S265	In main harness, near breakout to C238. See **Fig. 17**.
S266	In main harness, near breakout to C238. See **Fig. 17**.
S267	In body main harness, near breakout to C212. See **Fig. 24**.
S268	In body main harness, near breakout to G203. See **Fig. 26**.
S269	In body main harness, near breakout to G203. See **Fig. 26**.
S270	In body main harness, near breakout to G203. See **Fig. 26**.
S271	In body main harness, near breakout to G203. See **Fig. 26**.
S272	In body main harness, near breakout to keyless entry keypad. See **Fig. 40**.
S273	In body main harness, in breakout to C238. See **Fig. 26**.
S276 (Expedition)	In body main harness, in breakout to G300. See **Fig. 25**.
S276 (Navigator)	In body main harness, in breakout to G300. See **Fig. 27**.
S300 (Expedition)	In body main harness, near breakout to G300. See **Fig. 25**.
S300 (Navigator)	In body main harness, near breakout to G300. See **Fig. 27**.
S301 (Expedition)	In body main harness, near breakout to C800. See **Fig. 25**.
S301 (Navigator)	In body main harness, near breakout to G300. See **Fig. 27**.
S302 (Expedition)	In body main harness, near breakout to G300. See **Fig. 25**.
S302 (Navigator)	In body main harness, near breakout to G300. See **Fig. 27**.
S303 (Expedition)	In body main harness, near breakout to C3051. See **Fig. 24**.
S303 (Navigator)	In body main harness, near breakout to C3051. See **Fig. 26**.
S304 (Expedition)	In body main harness, near breakout to C3050. See **Fig. 25**.
S304 (Navigator)	In body main harness, near breakout to G300. See **Fig. 27**.
S305 (Expedition)	In body main harness, near breakout to C3050. See **Fig. 25**.
S305 (Navigator)	In body main harness, near breakout to G300. See **Fig. 27**.
	In body main harness, near breakout to C314. See

S306 (Expedition)	**Fig. 25**.
S306 (Navigator)	In body main harness, near breakout to C314. See **Fig. 27**.
S307 (Expedition)	In body main harness, near breakout to C314. See **Fig. 25**.
S307 (Navigator)	In body main harness, near breakout to C314. See **Fig. 27**.
S308 (Expedition)	In body main harness, near breakout to C314. See **Fig. 25**.
S308 (Navigator)	In body main harness, near breakout to C314. See **Fig. 27**.
S309 (Expedition)	In body main harness, near breakout to C314. See **Fig. 25**.
S309 (Navigator)	In body main harness, near breakout to C314. See **Fig. 27**.
S310 (Expedition)	In body main harness, near breakout to C314. See **Fig. 25**.
S310 (Navigator)	In body main harness, near breakout to C314. See **Fig. 27**.
S311 (Expedition)	In body main harness, near breakout to C3051. See **Fig. 24**.
S311 (Navigator)	In body main harness, near breakout to C3051. See **Fig. 26**.
S312 (Expedition)	In body main harness, near breakout to C3051. See **Fig. 24**.
S312 (Navigator)	In body main harness, near breakout to C3051. See **Fig. 26**.
S313 (Expedition)	In body main harness, near breakout to C3051. See **Fig. 24**.
S313 (Navigator)	In body main harness, near breakout to C3051. See **Fig. 26**.
S314 (Expedition)	In body main harness, near breakout to C3051. See **Fig. 24**.
S314 (Navigator)	In body main harness, near breakout to C3051. See **Fig. 26**.
S315 (Expedition)	In body main harness, near breakout to G301. See **Fig. 24**.
S315 (Navigator)	In body main harness, near breakout to G301. See **Fig. 26**.
S316 (Expedition)	In body main harness, near breakout to G301. See **Fig. 24**.
S316 (Navigator)	In body main harness, near breakout to G301. See **Fig. 26**.
S317 (Expedition)	In body main harness, near breakout to G301. See **Fig. 24**.
S317 (Navigator)	In body main harness, near breakout to G301. See **Fig. 26**.
	In body main harness, near breakout to G301. See

S318 (Expedition)	**Fig. 24**.
S318 (Navigator)	In body main harness, near breakout to G301. See **Fig. 26**.
S319 (Expedition)	In body main harness, near breakout to G301. See **Fig. 24**.
S319 (Navigator)	In body main harness, near breakout to G301. See **Fig. 26**.
S320 (Expedition)	In body main harness, near breakout to G301. See **Fig. 24**.
S320 (Navigator)	In body main harness, near breakout to G301. See **Fig. 26**.
S321 (Expedition)	In body main harness, near breakout to G301. See **Fig. 24**.
S321 (Navigator)	In body main harness, near breakout to G301. See **Fig. 26**.
S322	In body main harness, near breakout to G301. See **Fig. 26**.
S323	In power seats harness, near breakout to driver seat rear height motor. See **Fig. 36**.
S324	In power seats harness, near breakout to C327. See **Fig. 36**.
S325	In power seats harness, near breakout to C327. See **Fig. 36**.
S326	In power seats harness, near breakout to driver seat rear height motor. See **Fig. 36**.
S327	In power seats harness, near breakout to C316. See **Fig. 37**.
S328	In power seats harness, near breakout to climate controlled seat module. See **Fig. 37**.
S329	In power seats harness, near breakout to passenger side climate controlled seat cushion thermo-electric device. See **Fig. 37**.
S330	N power seats harness, near breakout to passenger side climate controlled seat cushion thermo-electric device. See **Fig. 37**.
S331	In body main harness, near breakout to G300. See **Fig. 27**.
S332	In body main harness, in breakout to C314. See **Fig. 27**.
S333	In body main harness, near breakout to G301. See **Fig. 26**.
S334	In body main harness, near breakout to G301. See **Fig. 26**.
S335	In body main harness, near breakout to G301. See **Fig. 26**.
S336	In body main harness, near breakout to G301. See **Fig. 26**.
	In main harness, near breakout to C315. See **Fig**

S337 (Expedition)	**16**.
S337 (Navigator)	In main harness, near breakout to C315. See **Fig. 17**.
S337 (Navigator) (W/THX)	In main harness, near breakout to THX amplifier. See **Fig. 18**.
S338 (Expedition)	In main harness, near breakout to C315. See **Fig. 16**.
S338 (Navigator)	In main harness, near breakout to C315. See **Fig. 17**.
S338 (Navigator) (W/THX)	In main harness, near breakout to THX amplifier. See **Fig. 18**.
S339 (Expedition)	In console panel harness, in breakout to C315. See **Fig. 22**.
S339 (Navigator)	In console panel harness, in breakout to C315. See **Fig. 23**.
S340 (Expedition)	In console panel harness, in breakout to C314. See **Fig. 22**.
S340 (Navigator)	In console panel harness, in breakout to C314. See **Fig. 23**.
S341 (Expedition)	In console panel harness, in breakout to C315. See **Fig. 22**.
S341 (Navigator)	In console panel harness, in breakout to C315. See **Fig. 23**.
S342 (Expedition)	In console panel harness, in breakout to C314. See **Fig. 22**.
S342 (Navigator)	In console panel harness, in breakout to C314. See **Fig. 23**.
S343 (Expedition)	In console panel harness, in breakout to C315. See **Fig. 22**.
S343 (Navigator)	In console panel harness, in breakout to C315. See **Fig. 23**.
S344 (Expedition)	In console panel harness, in breakout to C314. See **Fig. 22**.
S344 (Navigator)	In console panel harness, in breakout to C314. See **Fig. 23**.
S345 (Expedition)	In console panel harness, in breakout to C315. See **Fig. 22**.
S345 (Navigator)	In console panel harness, in breakout to C315. See **Fig. 23**.
S346 (Expedition)	In console panel harness, in breakout to C314. See **Fig. 22**.
S346 (Navigator)	In console panel harness, in breakout to C314. See **Fig. 23**.
S347 (Expedition)	In console panel harness, in breakout to satellite radio receiver. See **Fig. 22**.
S347 (Navigator)	In console panel harness, in breakout to satellite radio receiver. See **Fig. 23**.
	In console panel harness, in breakout to satellite

S348 (Expedition)	radio receiver. See **Fig. 22**.
S348 (Navigator)	In console panel harness, in breakout to satellite radio receiver. See **Fig. 23**.
S349 (Expedition)	In console panel harness, near breakout to satellite radio receiver. See **Fig. 22**.
S349 (Navigator)	In console panel harness, near breakout to satellite radio receiver. See **Fig. 23**.
S350 (Expedition)	In console panel harness, near breakout to satellite radio receiver. See **Fig. 22**.
S350 (Navigator)	In console panel harness, near breakout to satellite radio receiver. See **Fig. 23**.
S351 (Expedition)	In console panel harness, near breakout to satellite radio receiver. See **Fig. 22**.
S351 (Navigator)	In console panel harness, near breakout to satellite radio receiver. See **Fig. 23**.
S352 (Expedition)	In console panel harness, in breakout to auxiliary audio module. See **Fig. 22**.
S352 (Navigator)	In console panel harness, in breakout to auxiliary audio module. See **Fig. 23**.
S353	In console panel harness, in breakout to C315. See **Fig. 22**.
S354	In console panel harness, in breakout to C314. See **Fig. 23**.
S400 (Expedition)	In rear light connector harness, near breakout to left rear quarter window motor. See **Fig. 28**.
S400 (Expedition-EL & Navigator-L)	In rear light connector harness, near breakout to left rear quarter window motor. See **Fig. 32**.
S400 (Navigator)	In rear light connector harness, near breakout to left rear quarter window motor. See **Fig. 30**.
S401 (Expedition)	In rear light connector harness, in breakout to C494. See **Fig. 28**.
S401 (Expedition-EL & Navigator-L)	In rear light connector harness, in breakout to C494. See **Fig. 32**.
S401 (Navigator)	In rear light connector harness, in breakout to C494. See **Fig. 30**.
S402 (Expedition)	In rear light connector harness, in breakout to C494. See **Fig. 28**.
S402 (Expedition-EL & Navigator-L)	In rear light connector harness, in breakout to C494. See **Fig. 32**.
S402 (Navigator)	In rear light connector harness, in breakout to C494. See **Fig. 30**.
S403 (Expedition)	In rear light connector harness, near breakout to G400. See **Fig. 28**.
S403 (Expedition-EL & Navigator-L)	In rear light connector harness, near breakout to G400. See **Fig. 32**.
S403 (Navigator)	In rear light connector harness, near breakout to G400. See **Fig. 30**.
	In rear light connector harness, near breakout to

S404 (Expedition)	G400. See **Fig. 28**.
S404 (Expedition-EL & Navigator-L)	In rear light connector harness, near breakout to G400. See **Fig. 32**.
S404 (Navigator)	In rear light connector harness, near breakout to G400. See **Fig. 30**.
S405 (Expedition)	In rear light connector harness, near breakout to G401. See **Fig. 28**.
S405 (Expedition-EL & Navigator-L)	In rear light connector harness, near breakout to C405. See **Fig. 32**.
S405 (Navigator)	In rear light connector harness, near breakout to power liftgate module. See **Fig. 30**.
S406 (Expedition)	In rear light connector harness, near breakout to G401. See **Fig. 28**.
S406 (Expedition-EL & Navigator-L)	In rear light connector harness, near breakout to C405. See **Fig. 32**.
S406 (Navigator)	In rear light connector harness, near breakout to power liftgate module. See **Fig. 30**.
S407 (Expedition)	In rear light connector harness, near breakout to G401. See **Fig. 28**.
S407 (Expedition-EL & Navigator-L)	In rear light connector harness, near breakout to C405. See **Fig. 32**.
S407 (Navigator)	In rear light connector harness, near breakout to power liftgate module. See **Fig. 30**.
S408 (Expedition)	In rear light connector harness, near breakout to parking aid speaker. See **Fig. 28**.
S408 (Expedition-EL & Navigator-L)	In rear light connector harness, near breakout to parking aid speaker. See **Fig. 32**.
S408 (Navigator)	In rear light connector harness, near breakout to parking aid speaker. See **Fig. 30**.
S409 (Expedition)	In rear light connector harness, near breakout to parking aid speaker. See **Fig. 28**.
S409 (Expedition-EL & Navigator-L)	In rear light connector harness, near breakout to parking aid speaker. See **Fig. 32**.
S409 (Navigator)	In rear light connector harness, near breakout to parking aid speaker. See **Fig. 30**.
S410	In rear light connector harness, in breakout to rear mode door actuator. See **Fig. 51**.
S411	In rear light connector harness, in breakout to rear mode door actuator. See **Fig. 51**.
S412	In rear light connector harness, near breakout to auxiliary blower motor resistor assembly. See **Fig. 51**.
S413 (Expedition)	In rear light connector harness, near breakout to C410. See **Fig. 29**.
S413 (Expedition-EL & Navigator-L)	In rear light connector harness, near breakout to C410. See **Fig. 33**.
S413 (Navigator)	In rear light connector harness, near breakout to C410. See **Fig. 31**.

S414	In rear light connector harness, near breakout to G402. See **Fig. 31**.
S415 (Expedition)	In rear light connector harness, near breakout to right rear quarter window motor. See **Fig. 29**.
S415 (Expedition-EL & Navigator-L)	In rear light connector harness, near breakout to right rear quarter window motor. See **Fig. 33**.
S415 (Navigator)	In rear light connector harness, near breakout to G402. See **Fig. 31**.
S416 (Expedition)	In rear light connector harness, near breakout to right rear quarter window motor. See **Fig. 29**.
S416 (Expedition-EL & Navigator-L)	In rear light connector harness, near breakout to right rear quarter window motor. See **Fig. 33**.
S416 (Navigator)	In rear light connector harness, near breakout to G402. See **Fig. 31**.
S417 (Expedition)	In rear light connector harness, near breakout to right rear quarter window motor. See **Fig. 29**.
S417 (Expedition-EL & Navigator-L)	In rear light connector harness, near breakout to right rear quarter window motor. See **Fig. 33**.
S417 (Navigator)	In rear light connector harness, near breakout to auxiliary relay box 2. See **Fig. 31**.
S418 (Expedition)	In rear light connector harness, near breakout to right rear quarter window motor. See **Fig. 29**.
S418 (Expedition-EL & Navigator-L)	In rear light connector harness, near breakout to right rear quarter window motor. See **Fig. 33**.
S418 (Navigator)	In rear light connector harness, near breakout to G402. See **Fig. 31**.
S419 (Expedition)	In rear light connector harness, near breakout to right rear quarter window motor. See **Fig. 29**.
S419 (Expedition-EL & Navigator-L)	In rear light connector harness, near breakout to right rear quarter window motor. See **Fig. 33**.
S419 (Navigator)	In rear light connector harness, near breakout to G402. See **Fig. 31**.
S420	In rear light connector harness, near breakout to right rear park/stop/turn light 1. See **Fig. 31**.
S421	In rear light connector harness, near breakout to left rear park/stop/turn light 1. See **Fig. 30**.
S422	In rear light connector harness, near breakout to C408. See **Fig. 33**.
S423 (Expedition)	In switch & wiring assembly, near breakout to rear window defrost grid. See **Fig. 44**.
S423 (Navigator)	In switch & wiring assembly, near breakout to rear window defrost grid. See **Fig. 45**.
S424 (Expedition)	In switch & wiring assembly, near breakout to rear window defrost grid. See **Fig. 44**.
S424 (Navigator)	In switch & wiring assembly, near breakout to rear window defrost grid. See **Fig. 45**.
S425	In switch & wiring assembly, near breakout to rear window defrost grid. See **Fig. 45**.

S426 (Expedition)	In switch & wiring assembly, near breakout to rear window defrost grid. See **Fig. 44**.
S426 (Navigator)	In switch & wiring assembly, near breakout to rear window defrost grid. See **Fig. 45**.
S427	In switch & wiring assembly, near breakout to C495. See **Fig. 45**.
S428	In auxiliary case jumper, near breakout to rear mode door actuator. See **Fig. 52**.
S429	In auxiliary case jumper, near breakout to rear mode door actuator. See **Fig. 52**.
S430	In auxiliary case jumper, near breakout to rear mode door actuator. See **Fig. 52**.
S431 (Expedition-EL & Navigator-L)	In taillights harness, near breakout to fuel pump module. See **Fig. 35**.
S431 (Expedition & Navigator)	In taillights harness, near breakout to fuel pump module. See **Fig. 34**.
S432 (Expedition-EL & Navigator-L)	In taillights harness, near breakout to fuel pump module. See **Fig. 35**.
S432 (Expedition & Navigator)	In taillights harness, near breakout to fuel pump module. See **Fig. 34**.
S433 (Expedition-EL & Navigator-L)	In taillights harness, near breakout to fuel pump module. See **Fig. 35**.
S433 (Expedition & Navigator)	In taillights harness, near breakout to fuel pump module. See **Fig. 34**.
S434 (Expedition-EL & Navigator-L)	In taillights harness, near breakout to fuel pump module. See **Fig. 35**.
S434 (Expedition & Navigator)	In taillights harness, near breakout to fuel pump module. See **Fig. 34**.
S435 (Expedition-EL & Navigator-L)	In taillights harness, near breakout to fuel pump module. See **Fig. 35**.
S435 (Expedition & Navigator)	In taillights harness, near breakout to fuel pump module. See **Fig. 34**.
S436 (Expedition-EL & Navigator-L)	In taillights harness, near breakout to G405. See **Fig. 35**.
S436 (Expedition & Navigator)	In taillights harness, near breakout to G405. See **Fig. 34**.
S437 (Expedition-EL & Navigator-L)	In taillights harness, near breakout to G405. See **Fig. 35**.
S437 (Expedition & Navigator)	In taillights harness, near breakout to G405. See **Fig. 34**.
S438 (Expedition-EL & Navigator-L)	In taillights harness, near breakout to 4-pin trailer tow connector. See **Fig. 35**.
S438 (Expedition & Navigator)	In taillights harness, near breakout to 4-pin trailer tow connector. See **Fig. 34**.
S439 (Expedition-EL & Navigator-L)	In taillights harness, near breakout to 4-pin trailer tow connector. See **Fig. 35**.
S439 (Expedition & Navigator)	In taillights harness, near breakout to 4-pin trailer tow connector. See **Fig. 34**.

S442	In body main harness, near breakout to C465. See **Fig. 32**.
S443	In body main harness, near breakout to C405. See **Fig. 32**.
S444 (Expedition)	In body main harness, in breakout to subwoofer amplifier. See **Fig. 28**.
S444 (Expedition-EL & Navigator-L)	In body main harness, in breakout to subwoofer amplifier. See **Fig. 32**.
S444 (Navigator)	In body main harness, in breakout to subwoofer amplifier. See **Fig. 30**.
S445	In rear light connector harness, near breakout to right rear tweeter. See **Fig. 31**.
S500	In driver's door window regulator harness, in breakout keyless entry keypad. See **Fig. 40**.
S501	In driver's door window regulator harness, in breakout keyless entry keypad. See **Fig. 40**.
S502	In main body harness, in breakout to left side exterior rearview mirror. See **Fig. 38**.
S503 (Expedition)	In main body harness, near breakout to master window adjust switch. See **Fig. 38**.
S503 (Navigator)	In main body harness, near breakout to master window adjust switch. See **Fig. 40**.
S504	In main body harness, in breakout to master window adjust switch. See **Fig. 40**.
S505	In main body harness, in breakout to master window adjust switch. See **Fig. 40**.
S600	In right front window regulator harness, near breakout to front passenger's door ajar switch. See **Fig. 41**.
S601	In body main harness, near breakout to right side exterior rearview mirror. See **Fig. 41**.
S602	In body main harness, near breakout to right side exterior rearview mirror. See **Fig. 41**.
S603	In body main harness, near breakout to passenger side door lock switch. See **Fig. 41**.
S604	In body main harness, near breakout to passenger side door lock switch. See **Fig. 41**.
S900 (Expedition)	In interior illumination harness, near breakout to C406. See **Fig. 46**.
S900 (Expedition-EL & Navigator-L)	In interior illumination harness, near breakout to C406. See **Fig. 48**.
S900 (Navigator)	In interior illumination harness, near breakout to C406. See **Fig. 47**.
S901 (Expedition)	In interior illumination harness, near breakout to C406. See **Fig. 46**.
S901 (Expedition-EL & Navigator-L)	In interior illumination harness, near breakout to C406. See **Fig. 48**.
	In interior illumination harness, near breakout to

S901 (Navigator)	C406. See **Fig. 47**.
S902 (Expedition)	In interior illumination harness, near breakout to C406. See **Fig. 46**.
S902 (Expedition-EL & Navigator-L)	In interior illumination harness, near breakout to C406. See **Fig. 48**.
S902 (Navigator)	In interior illumination harness, near breakout to C406. See **Fig. 47**.
S903 (Expedition)	In interior illumination harness, near breakout to left vanity mirror light. See **Fig. 46**.
S903 (Expedition-EL & Navigator-L)	In interior illumination harness, near breakout to left vanity mirror light. See **Fig. 48**.
S903 (Navigator)	In interior illumination harness, near breakout to left vanity mirror light. See **Fig. 47**.
S904 (Expedition)	In interior illumination harness, near breakout to left vanity mirror light. See **Fig. 46**.
S904 (Expedition-EL & Navigator-L)	In interior illumination harness, near breakout to left vanity mirror light. See **Fig. 48**.
S904 (Navigator)	In interior illumination harness, near breakout to left vanity mirror light. See **Fig. 47**.
S905 (Expedition)	In body main harness, near breakout to C913. See **Fig. 28**.
S905 (Expedition-EL & Navigator-L)	In body main harness, near breakout to C913. See **Fig. 32**.
S905 (Navigator)	In body main harness, near breakout to C913. See **Fig. 30**.
S906 (Expedition)	In body main harness, near breakout to C913. See **Fig. 28**.
S906 (Expedition-EL & Navigator-L)	In body main harness, near breakout to C913. See **Fig. 32**.
S906 (Navigator)	In body main harness, near breakout to C913. See **Fig. 30**.
S907 (Expedition)	In body main harness, near breakout to C913. See **Fig. 28**.
S907 (Expedition-EL & Navigator-L)	In body main harness, near breakout to C913. See **Fig. 32**.
S907 (Navigator)	In body main harness, near breakout to C913. See **Fig. 30**.
S908 (Expedition)	In roof sliding panel control switch harness, in breakout to DVD player. See **Fig. 46**.
S908 (Expedition-EL & Navigator-L)	In roof sliding panel control switch harness, in breakout to DVD player. See **Fig. 48**.
S908 (Navigator)	In roof sliding panel control switch harness, in breakout to DVD player. See **Fig. 47**.
S909 (Expedition)	In roof sliding panel control switch harness, in breakout to DVD player. See **Fig. 46**.
S909 (Expedition-EL & Navigator-L)	In roof sliding panel control switch harness, in breakout to DVD player. See **Fig. 48**.
	In roof sliding panel control switch harness, in

S909 (Navigator)	breakout to DVD player. See **Fig. 47**.
S910 (Expedition)	In vanity mirror light harness, in breakout to C298. See **Fig. 46**.
S910 (Expedition-EL & Navigator-L)	In vanity mirror light harness, in breakout to C298. See **Fig. 48**.
S910 (Navigator)	In vanity mirror light harness, in breakout to C298. See **Fig. 47**.
S911 (Expedition)	In vanity mirror light harness, in breakout to C298. See **Fig. 46**.
S911 (Expedition-EL & Navigator-L)	In vanity mirror light harness, in breakout to C298. See **Fig. 48**.
S911 (Navigator)	In vanity mirror light harness, in breakout to C298. See **Fig. 47**.
S912 (Expedition)	In vanity mirror light harness, in breakout to C298. See **Fig. 46**.
S912 (Expedition-EL & Navigator-L)	In vanity mirror light harness, in breakout to C298. See **Fig. 48**.
S912 (Navigator)	In vanity mirror light harness, in breakout to C298. See **Fig. 47**.
S913 (Expedition)	In vanity mirror light harness, near breakout to electronic compass. See **Fig. 46**.
S913 (Expedition-EL & Navigator-L)	In vanity mirror light harness, near breakout to electronic compass. See **Fig. 48**.
S913 (Navigator)	In vanity mirror light harness, near breakout to electronic compass. See **Fig. 47**.
S914 (Expedition)	In roof sliding panel control switch harness, near breakout to DVD player. See **Fig. 46**.
S914 (Expedition-EL & Navigator-L)	In roof sliding panel control switch harness, near breakout to DVD player. See **Fig. 48**.
S914 (Navigator)	In roof sliding panel control switch harness, near breakout to DVD player. See **Fig. 47**.
S915 (Expedition)	In roof sliding panel control switch harness, in breakout to C913. See **Fig. 46**.
S915 (Expedition-EL & Navigator-L)	In roof sliding panel control switch harness, in breakout to C913. See **Fig. 48**.
S915 (Navigator)	In roof sliding panel control switch harness, in breakout to C913. See **Fig. 47**.
S916 (Expedition)	In roof sliding panel control switch harness, in breakout to C913. See **Fig. 46**.
S916 (Expedition-EL & Navigator-L)	In roof sliding panel control switch harness, in breakout to C913. See **Fig. 48**.
S916 (Navigator)	In roof sliding panel control switch harness, in breakout to C913. See **Fig. 47**.
S917 (Expedition)	In roof sliding panel control switch harness, in breakout to C913. See **Fig. 46**.
S917 (Expedition-EL & Navigator-L)	In roof sliding panel control switch harness, in breakout to C913. See **Fig. 48**.
	In roof sliding panel control switch harness, in

S917 (Navigator)	breakout to C913. See **Fig. 47**.

2007 ELECTRICAL

Fuses & Circuit Breakers - Expedition, Expedition EL, Navigator & Navigator L

IDENTIFICATION

CAUTION: When battery is disconnected, vehicle computer and memory systems may lose memory data. Driveability problems may exist until computer systems have completed a relearn cycle. See COMPUTER RELEARN PROCEDURES article in GENERAL INFORMATION before disconnecting battery.

BATTERY JUNCTION BOX (BJB)

NOTE: For component location, see appropriate ELECTRICAL COMPONENT LOCATIONS article.

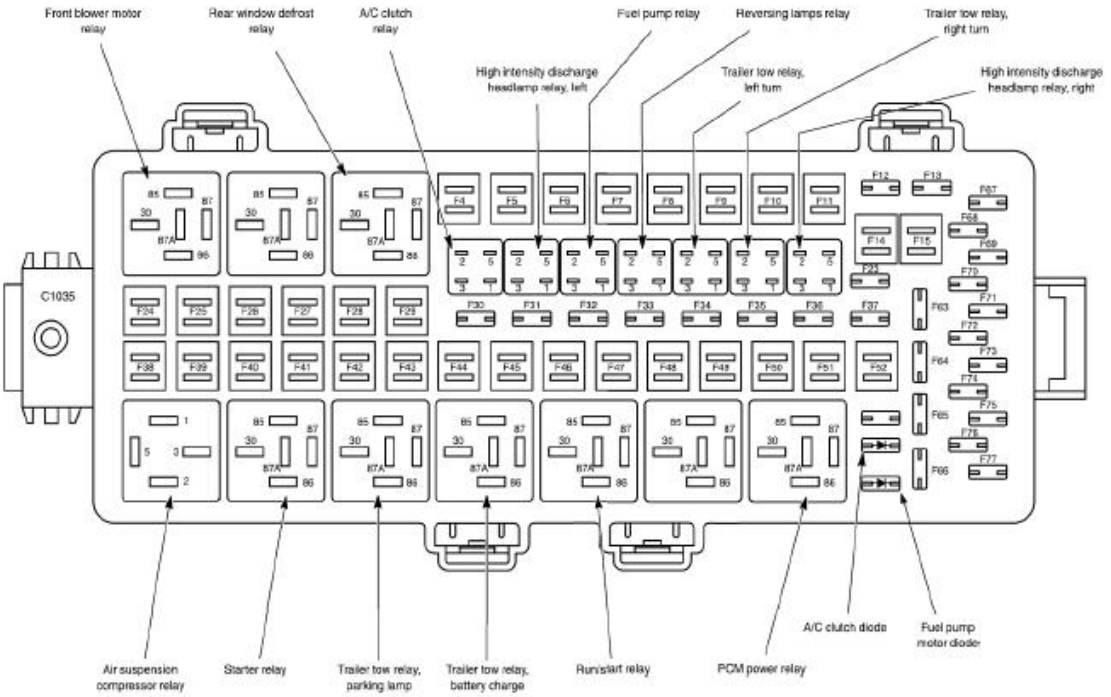

Fig. 1: Battery Junction Box Components

BATTERY JUNCTION BOX LEGENDS

Fuse	Amps	Circuits protected
F4	30	Third row folding seat relay, left
F5	40	Trailer electronic brake control module
F6	60	ABS control module
F7	40	Power fold running board module (Navigator)
F8	40	Climate controlled seat module
F9	60	ABS control module
F10	20	Power point, console 1
F11	30	Rear blower motor relay 1

F12	25	Trailer tow relay, parking lamp
F13	30	Trailer tow relay, battery charge
F14	-	Not used
F15	-	Not used
F23	15	Exterior rear view mirror, LH side, Exterior rear view mirror, RH side
F24	40	Front blower motor relay
F25	-	Not used
F26	-	Not used
F27	30	Power liftgate module
F28	40	Rear window defrost relay
F29	30	Power seat switch, right
F30	10	A/C clutch relay
F31	15	Brake pedal position switch
F32	20	Fuel pump relay
F33	20	Reversing lamps relay
F34	25	Trailer tow relay, left turn
F35	20	Four-wheel drive control module
F36	10	Powertrain Control Module (PCM), EVAP canister vent control solenoid
F37	15	6R75 automatic transmission (Expedition), 6HP26 automatic transmission (Navigator)
F38	30	Third row folding seat relay, right
F39	50	Air suspension compressor relay
F40	30	Starter relay
F41	20	Power point, instrument panel (Expedition), Power point, console 2 (Navigator)
F42	-	Not used
F43	20	Four-wheel drive control module (Expedition)
F44	20	High intensity discharge headlamp relay, left (Navigator)
F45	30	Power seat switch, left (without memory), Driver seat module (with memory)
F46	40	Run/start relay
F47	30	Air suspension module
F48	20	High intensity discharge headlamp relay, right (Navigator)
F49	30	Windshield wiper motor
F50	30	PCM power relay
F51	20	Power point, rear
F52	20	Cigar lighter, front
F63	15	Trailer tow connector, 7-pin
F64	-	Not used
F65	10	Air suspension module
F66	-	Not used
F67	10	Front blower motor relay
F68	-	Not used
F69	30	Smart Junction Box (SJB)
F70	20	A/C clutch relay, Electronic fan clutch, Heated Positive Crankcase Ventilation (PCV) valve
F71	5	Powertrain Control Module (PCM), Fuel pump motor diode

F72	20	Coil On Plug (COP) 1, Coil On Plug (COP) 2, Coil On Plug (COP) 3, Coil On Plug (COP) 4, Coil On Plug (COP) 5, Coil On Plug (COP) 6, Coil On Plug (COP) 7, Coil On Plug (COP) 8, Ignition transformer capacitor 1, Ignition transformer capacitor 2
F73	5	6R75 automatic transmission (Expedition), 6HP26 automatic transmission (Navigator)
F74	20	Brake pedal position switch, Charge Motion Control Valve (CMCV), Heated Oxygen Sensor (HO2S) #11, Heated Oxygen Sensor (HO2S) #12, Heated Oxygen Sensor (HO2S) #21, Heated Oxygen Sensor (HO2S) #22, Mass Air Flow/Intake Air Temperature (MAF/IAT) sensor, Vapor management valve, Variable Camshaft Timing (VCT) valve 1, Variable Camshaft Timing (VCT) valve 2
F75	5	Integrated wheel ends solenoid
F76	20	Powertrain Control Module (PCM)
F77	10	ABS control module

SMART JUNCTION BOX (SJB)

NOTE: For component location, see appropriate ELECTRICAL COMPONENT LOCATIONS article.

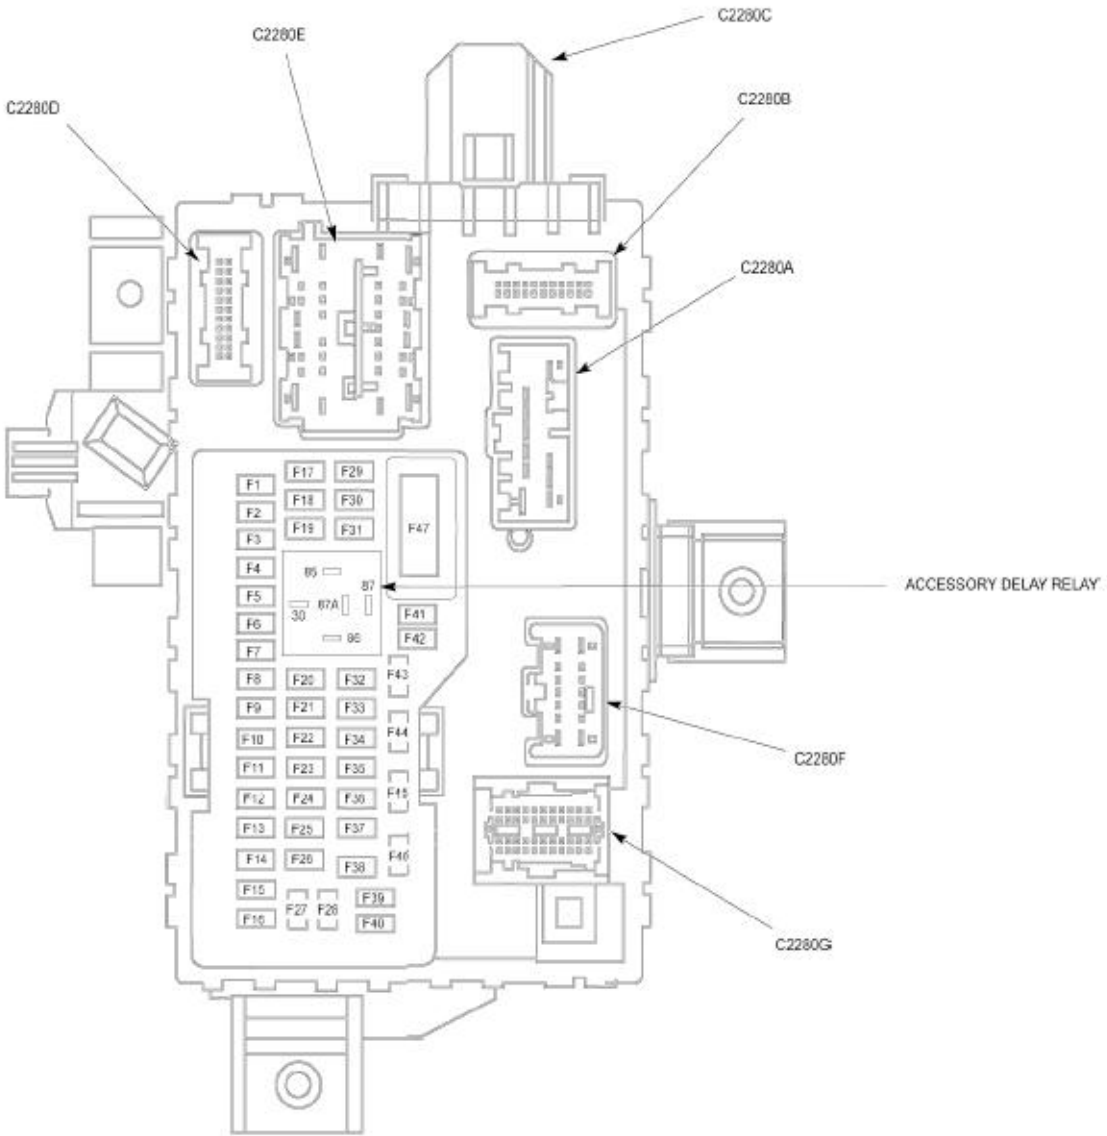

Fig. 2: Smart Junction Box Components

SMART JUNCTION BOX LEGENDS

Fuse	Amps	Circuits protected
F1	30	Power window motor, driver side front (Navigator)
F2	15	Driver seat module
F3	15	Auxiliary audio module, Satellite radio receiver, DVD player
F4	30	Power window motor, passenger side front (Navigator)
F5	10	Smart Junction Box (SJB)
F6	20	Smart Junction Box (SJB)
F7	10	Smart Junction Box (SJB)
F8	10	Smart Junction Box (SJB)
F9	15	Smart Junction Box (SJB)
F10	15	Smart Junction Box (SJB)
F11	10	Not used
F12	7.5	Exterior rear view mirror switch, Power seat switch, left (with memory)
F13	7.5	Not used
F14	10	Power liftgate module, Clock (Navigator)
F15	10	Manual climate control module, Electronic Automatic Temperature Control (EATC) module
F16	15	Electronic park brake release relay (Navigator), Electronic park brake reset relay (Navigator)
F17	20	Driver door unlock relay, Door lock relay, Liftgate glass release relay, Smart Junction Box (SJB)
F18	20	Not used
F19	25	Rear wiper motor assembly
F20	15	Adjustable pedal switch (without memory), Data Link Connector (DLC)
F21	15	Fog lamp relay, Smart Junction Box (SJB)
F22	15	Park lamp relay
F23	15	High beam relay
F24	20	Horn relay
F25	10	Battery saver relay
F26	10	Instrument cluster
F27	20	Ignition switch, Key release interlock actuator
F28	5	Audio unit
F29	5	Instrument cluster
F30	5	Not used
F31	10	Auto-dimming interior mirror unit, Electronic compass
F32	10	Restraints control module
F33	10	Electronic park brake release relay (Navigator), Electronic park brake reset relay (Navigator)
F34	5	Not used
F35	10	Four-wheel drive control module, Parking Aid Module (PAM)
F36	5	Passive anti-theft transceiver
F37	10	Manual climate control module, Electronic Automatic Temperature Control (EATC)

		module
F38	20	Subwoofer amplifier (with audiophile), THX amplifier (Navigator With THX audio)
F39	20	Audio unit
F40	20	THX amplifier (Navigator With THX audio)
F41	15	Master window adjust switch (Navigator), Power window switch, RH side front (Navigator), Power window motor, driver side front (Navigator), Power window motor, passenger side front (Navigator), Quarter window open relay, Quarter window close relay
F42	10	Trailer tow relay, battery charge
F43	10	Rear wiper motor assembly
F44	10	Not used
F45	5	Windshield wiper motor
F46	7.5	Rear blower motor relay 1, Rear blower motor relay 2, Rear blower motor relay 3
F47	30 CB	Master window adjust switch, Roof opening panel module

AUXILIARY RELAY BOX 1

NOTE: For component location, see appropriate ELECTRICAL COMPONENT LOCATIONS article.

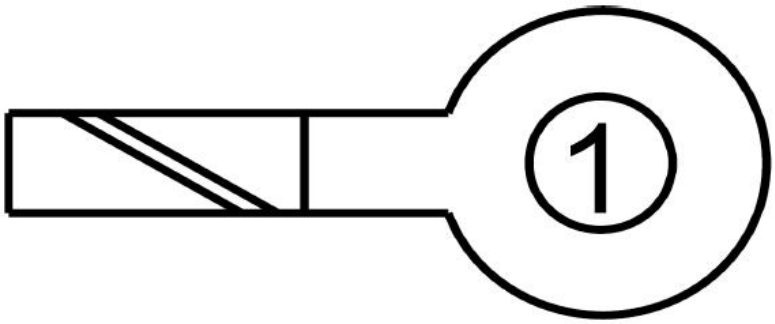
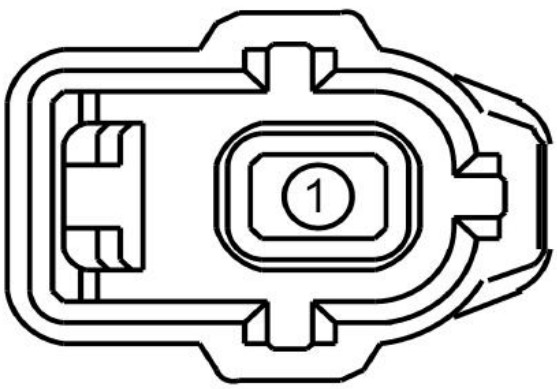
Connector: C102B	Description:	Harness:	Base Part #:
	GENERATOR	14B060	



Pin	Circuit	Gauge	Circuit Function	Qualifier
1	38 (RD)	04	Voltage supplied at all times (fusible link)	

Fig. 3: Identifying Connector C102B (Generator)
Courtesy of FORD MOTOR CO.

Connector: C103	Description:	Harness:	Base Part #:
	OIL PRESSURE SWITCH	12B637	9278



Pin	Circuit	Gauge	Circuit Function	Qualifier
1	31 (WH-RD)	20	Engine oil pressure indicator, control	

Fig. 4: Identifying Connector C103 (Oil Pressure Switch)
Courtesy of FORD MOTOR CO.

Connector: C107	Description:	Harness:	Base Part #:
	CYLINDERHEAD TEMPERATURE SENSOR	12A654	6G004

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	1102 (YE-LG)	20	Cylinder head temperature sensor signal	
2	359 (GY-RD)	20	Signal return	

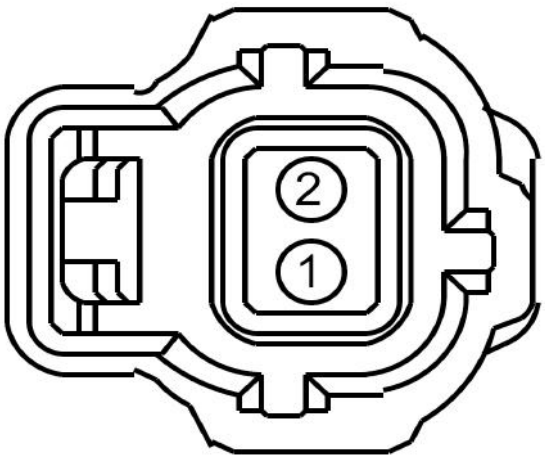


Fig. 5: Identifying Connector C107 (Cylinderhead Temperature Sensor)
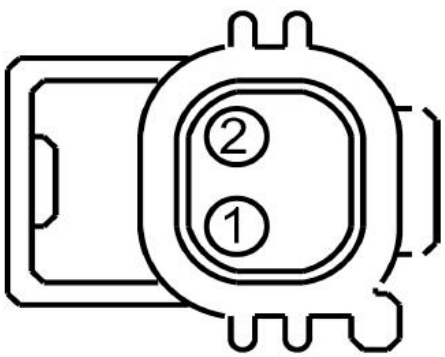
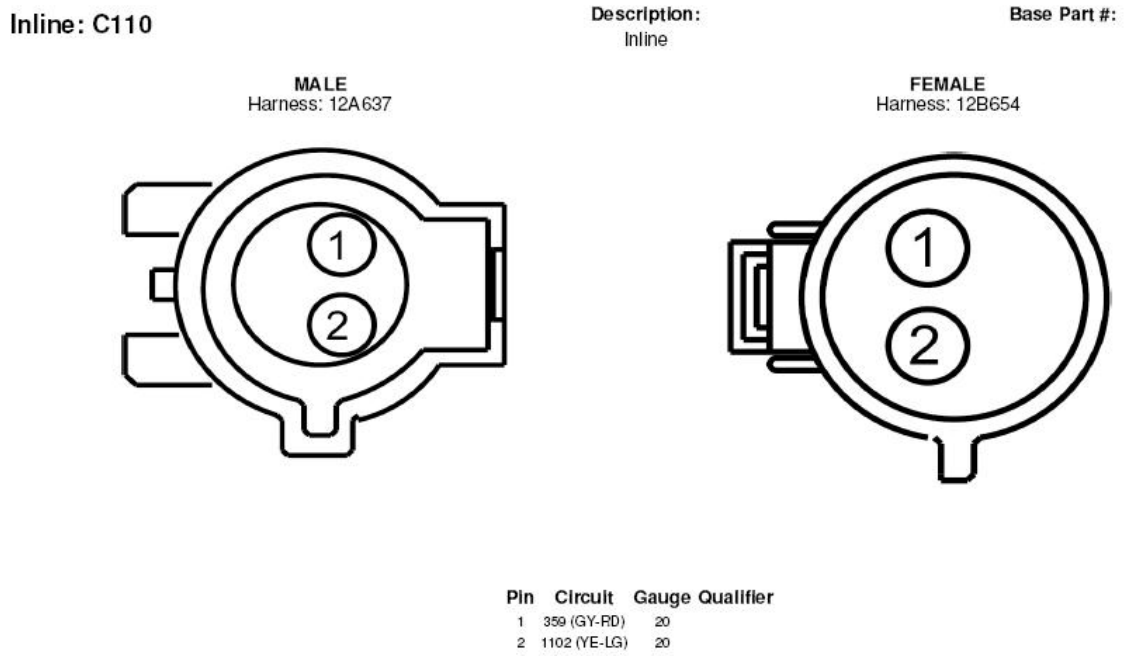
Courtesy of FORD MOTOR CO.

Connector: C109	Description:	Harness:	Base Part #:
	KNOCK SENSOR	12B637	12A699



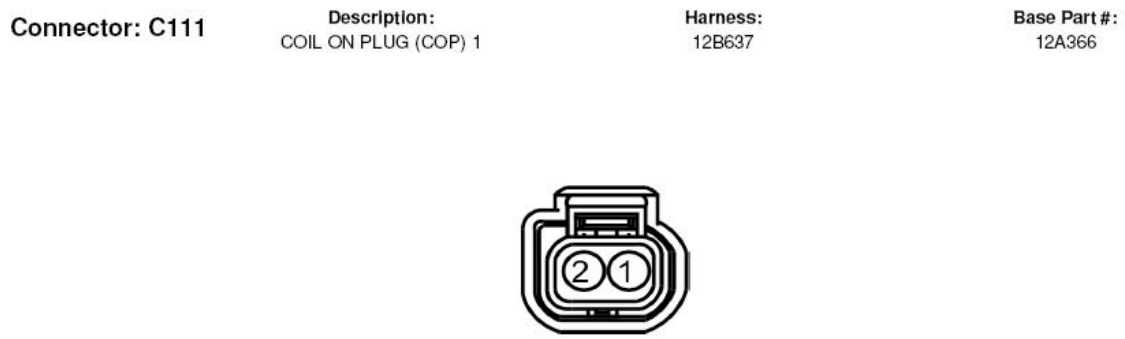
Pin	Circuit	Gauge	Circuit Function	Qualifier
1	1273 (YE)	20	Knock sensor -	
2	310 (YE-RD)	20	Knock sensor +	

Fig. 6: Identifying Connector C109 (Knock Sensor)
Courtesy of FORD MOTOR CO.



Pin	Circuit	Gauge	Qualifier
1	359 (GY-RD)	20	
2	1102 (YE-LG)	20	

Fig. 7: Identifying Connector C110 (Inline)
Courtesy of FORD MOTOR CO.



Pin	Circuit	Gauge	Circuit Function	Qualifier
1	1118 (RD)	20	Ignition coils relay switched power	
2	1024 (LG-WH)	20	Coil on Plug (COP) 1 control	

Fig. 8: Identifying Connector C111 (Coil On Plug (COP) 1)
Courtesy of FORD MOTOR CO.

Connector: C112	Description:	Harness:	Base Part #:
	COIL ON PLUG (COP) 2	12B637	12A366

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	1118 (RD)	20	Ignition coils relay switched power	
2	1026 (PK-WH)	20	Coil on Plug (COP) 2 control	

Fig. 9: Identifying Connector C112 (Coil On Plug (COP) 2)
Courtesy of FORD MOTOR CO.

Connector: C113	Description:	Harness:	Base Part #:
	COIL ON PLUG (COP) 3	12B637	12A366

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	1118 (RD)	20	Ignition coils relay switched power	
2	1028 (WH-PK)	20	Coil on Plug (COP) 3 control	

Fig. 10: Identifying Connector C113 (Coil On Plug (COP) 3)
Courtesy of FORD MOTOR CO.

Connector: C114	Description:	Harness:	Base Part #:
	COIL ON PLUG (COP) 4	12B637	12A366

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	1118 (RD)	20	Ignition coils relay switched power	
2	1030 (DG-VT)	20	Coil on Plug (COP) 4 control	

Fig. 11: Identifying Connector C114 (Coil On Plug (COP) 4)
Courtesy of FORD MOTOR CO.

Connector: C115	Description:	Harness:	Base Part #:
	COIL ON PLUG (COP) 5	12B637	12A366

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	1118 (RD)	20	Ignition coils relay switched power	
2	1021 (LG-YE)	20	Coil on Plug (COP) 5 control	

Fig. 12: Identifying Connector C115 (Coil On Plug (COP) 5)
Courtesy of FORD MOTOR CO.

Connector: C116	Description:	Harness:	Base Part #:
	COIL ON PLUG (COP) 6	12B637	12A366

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	1118 (RD)	20	Ignition coils relay switched power	
2	1025 (OG-YE)	20	Coil on Plug (COP) 6 control	

Fig. 13: Identifying Connector C116 (Coil On Plug (COP) 6)
Courtesy of FORD MOTOR CO.

Connector: C117	Description:	Harness:	Base Part #:
	COIL ON PLUG (COP) 7	12B637	12A366

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	1118 (RD)	20	Ignition coils relay switched power	
2	1027 (PK-LB)	20	Coil on Plug (COP) 7 control	

Fig. 14: Identifying Connector C117 (Coil On Plug (COP) 7)
Courtesy of FORD MOTOR CO.

Connector: C118	Description:	Harness:	Base Part #:
	COIL ON PLUG (COP) 8	12B637	12A366

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	1118 (RD)	20	Ignition coils relay switched power	
2	1029 (WH-RD)	20	Coil on Plug (COP) 8 control	

Fig. 15: Identifying Connector C118 (Coil On Plug (COP) 8)
Courtesy of FORD MOTOR CO.

Connector: C120	Description:	Harness:	Base Part #:
	POWER STEERING VALVE SOLENOID	12B637	3783

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	115 (LG-BK)	20	Power steering valve solenoid -	
2	114 (LB-YE)	20	Power steering valve solenoid +	

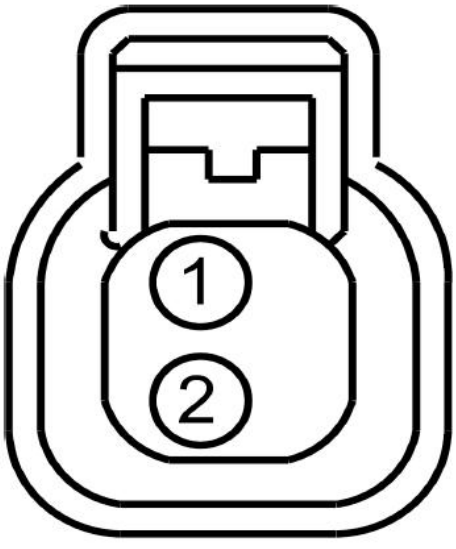


Fig. 16: Identifying Connector C120 (Power Steering Valve Solenoid)
Courtesy of FORD MOTOR CO.

Connector: C124 | **Description:** BRAKE FLUID LEVEL SWITCH | **Harness:** 14290 | **Base Part #:** 2L414

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	57 (BK)	20	Ground	
2	409 (TN-BK)	20	Brake fluid level switch signal	
3	977 (VT-WH)	20	Brake indicator, control	

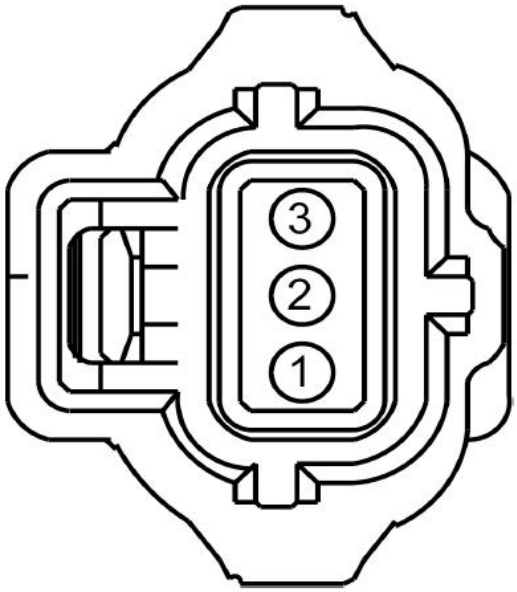

Fig. 17: Identifying Connector C124 (Brake Fluid Level Switch)
Courtesy of FORD MOTOR CO.

Connector: C125 | **Description:** WINDSHIELD WIPER MOTOR | **Harness:** 14290 | **Base Part #:** 17508

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	61 (YE-RD)	20	Front wiper switch circuit H	
2	28 (BK-PK)	20	Wiper ON/OFF signal	
3	676 (PK-OG)	20	Ground	
4	*	*	not used	
5	2025 (RD-YE)	14	Voltage supplied at all times (overload protected)	
6	57 (BK)	14	Ground	
7	941 (BK-WH)	14	Windshield washer pump motor, feed	
8	65 (DG)	14	Voltage in Run or Accessory (overload protected)	
9	63 (RD)	20	Front wiper switch circuit A	
10	56 (DB-OG)	20	Front wiper switch circuit C	
11	58 (WH)	20	Front wiper switch circuit B	
12	680 (LB-OG)	20	Washer switch signal	

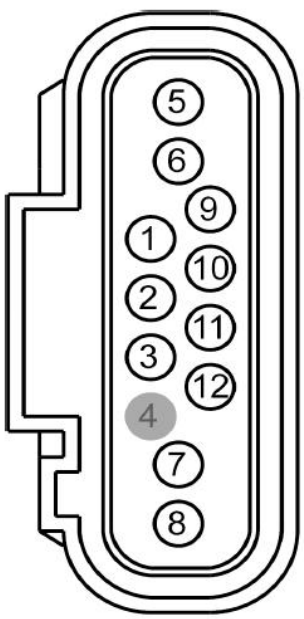

Fig. 18: Identifying Connector C125 (Windshield Wiper Motor)

Connector: C127

Description:	Harness:	Base Part #:
ENGINE COMPARTMENT PERIMETER DISARM SWITCH	14290	

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	1304 (VT-OG)	20	Anti-theft hood switch signal	
2	57 (BK)	20	Ground	

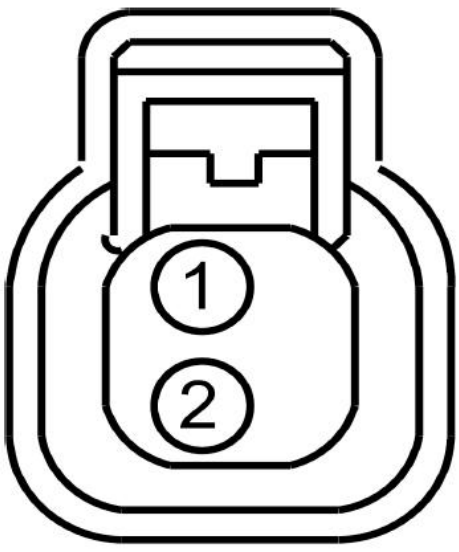

Fig. 19: Identifying Connector C127 (Engine Compartment Perimeter Disarm Switch)
Courtesy of FORD MOTOR CO.

Connector: C128

Description:	Harness:	Base Part #:
MASS AIR FLOW/ INTAKE AIR TEMPERATURE (MAF/IAT) SENSOR	12B637	

Pin: 4 - 968(TN-LB) - Mass Air Flow (MAF) sensor, signal return, Gauge: 20

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	743 (GY)	20	Intake Air Temperature (IAT) sensor signal	
2	359 (GY-RD)	20	Signal return	
3	967 (LB-RD)	20	Mass Air Flow (MAF) sensor, signal	
4	968 (TN-LB)	20	Mass Air Flow (MAF) sensor, signal return	
5	570 (BK-WH)	20	Ground	
6	361 (RD)	20	Voltage supplied in Start and Run (overload protected)	

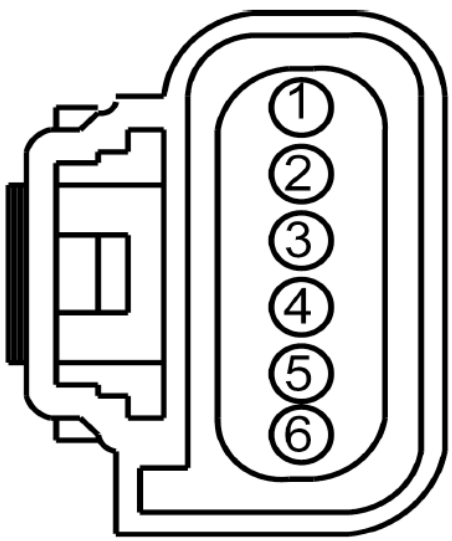

Fig. 20: Identifying Connector C128 (Mass Air Flow/ Intake Air Temperature (MAF/IAT) Sensor)
Courtesy of FORD MOTOR CO.

Connector: C131	Description:	Harness:	Base Part #:
	HORN	14290/15A599	13832

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	57 (BK)	16	Ground	
2	3040 (LG-OG)	16	R4.B3 relay switched power Police	
2	6 (YE-LG)	18	Horn relay output	

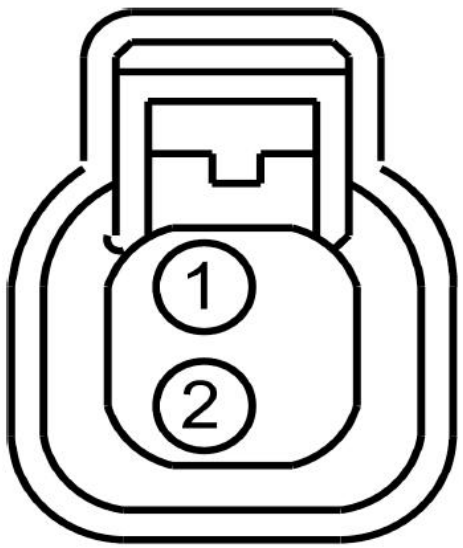

Fig. 21: Identifying Connector C131 (Horn)
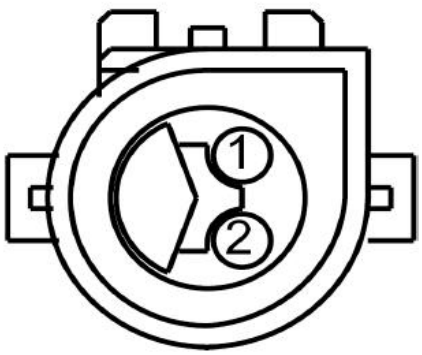
Courtesy of FORD MOTOR CO.

Connector: C132	Description:	Harness:	Base Part #:
	AMBIENT AIR TEMPERATURE SENSOR	14290	19E702



Pin	Circuit	Gauge	Circuit Function	Qualifier
1	3061 (LB-OG)	14	Ambient air temperature sensor signal	
2	3059 (YE-LG)	14	Signal return	

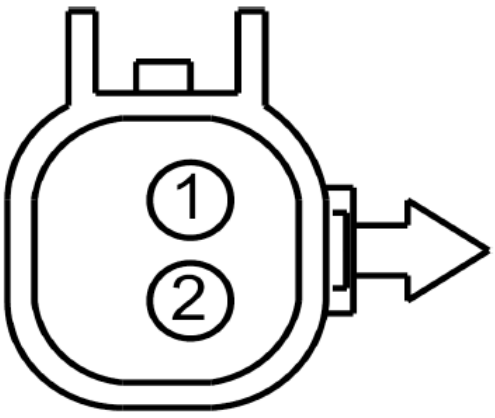
Fig. 22: Identifying Connector C132 (Ambient Air Temperature Sensor)
Courtesy of FORD MOTOR CO.

Inline: C133

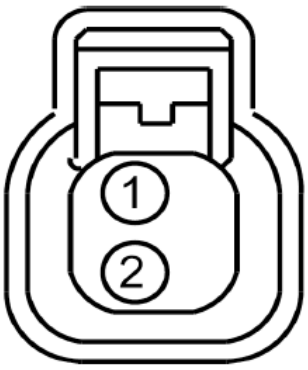
Description:
Inline

Base Part #:

MALE
Harness: 15A599



FEMALE
Harness: 14290



Pin: 1 - 57(BK) - Ground, Gauge: 16

Pin	Circuit	Gauge	Qualifier
1	57 (BK)	16	15A599
1	57 (BK)	18	14290
2	6 (YE-LG)	16	15A599

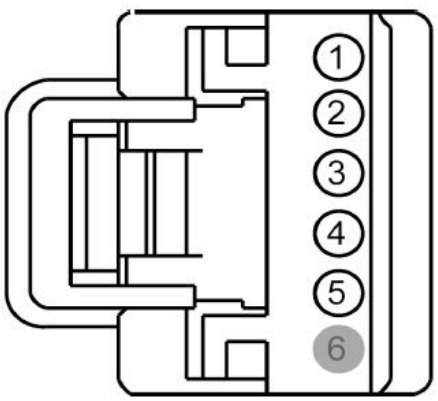
Connector: C287 | **Description:** AUTOLAMP SENSOR | **Harness:** 14401 | **Base Part #:** 13A018



Pin	Circuit	Gauge	Circuit Function	Qualifier
1	476 (BN-YE)	22	Sunload sensor, driver side signal	
2	218 (WH-VT)	22	Autolamp sensor signal	
3	905 (GY-LB)	20	Voltage supplied at all times (overload protected)	
4	1269 (OG-RD)	22	Anti-theft indicator control	
5	676 (PK-OG)	22	Ground	
6	*	*	not used

Connector: C1021

Description:
HEADLAMP, LEFT

Harness:
14290

Base Part #:
13008

Pin: 1 - 160(DB-WH) - Headlamp, left Low beam lamp feed, Gauge: 20

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	160 (DB-WH)	20	Headlamp, left Low beam lamp feed	
2	57 (BK)	16	Ground	
3	1337 (VT-YE)	20	Headlamp, left high beam lamp feed	

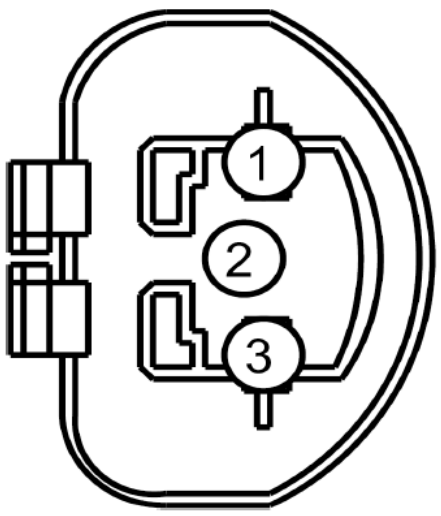

Fig. 215: Identifying Connector C1021 (Headlamp, Left)
Courtesy of FORD MOTOR CO.

Connector: C1023	Description:	Harness:	Base Part #:
	PARK/TURN LAMP, LEFT FRONT	13105	13411

Pin	Circuit	Gauge	Circuit Function Qualifier
1	57 (BK)	20	Ground
2	14 (BN)	20	Power, Exterior lamps
3	3 (LG-WH)	18	Left turn signal

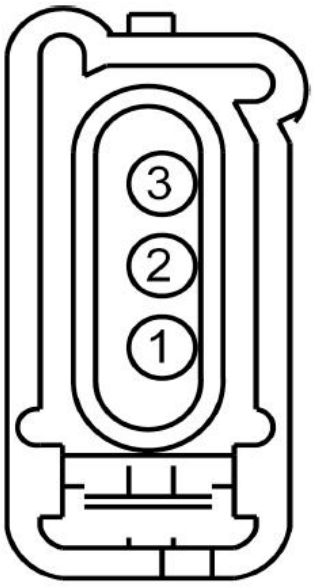

Fig. 216: Identifying Connector C1023 (Park/Turn Lamp, Left Front)
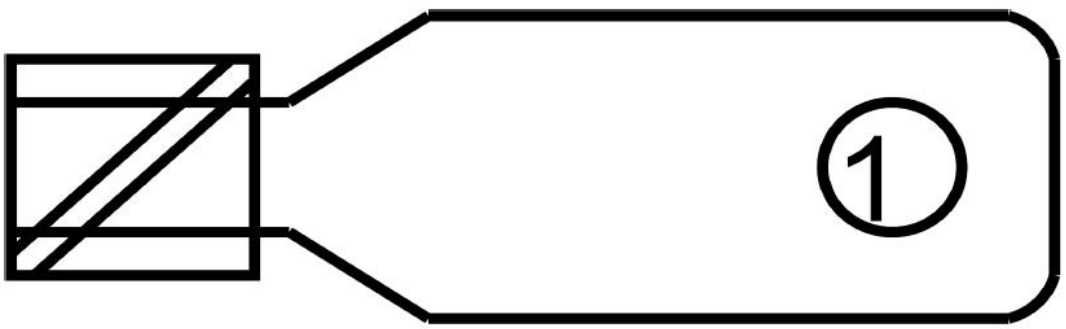
Courtesy of FORD MOTOR CO.

Connector: C1035	Description:	Harness:	Base Part #:
	BATTERY JUNCTION BOX (BJB)	14B060	



Pin	Circuit	Gauge	Circuit Function Qualifier
1	2037 (RD)	04	Battery cable +

Fig. 217: Identifying Connector C1035 (Battery Junction Box (BJB))
Courtesy of FORD MOTOR CO.

Connector: C1041	Description:	Harness:	Base Part #:
	HEADLAMP, RIGHT	14290	13008

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	161 (DG-OG)	20	Headlamp, right low beam lamp feed	
2	57 (BK)	16	Ground	
3	1335 (YE-WH)	20	Headlamp, right high beam lamp feed	

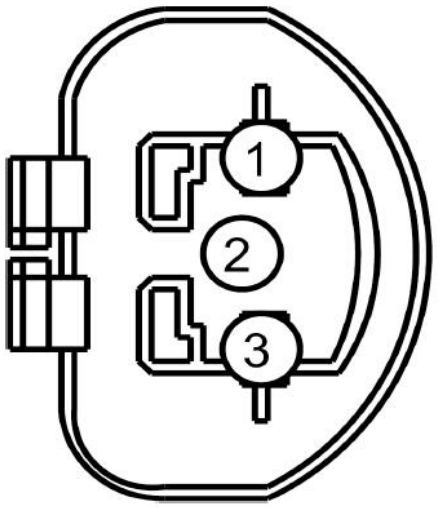


Fig. 218: Identifying Connector C1041 (Headlamp, Right)
Courtesy of FORD MOTOR CO.

Connector: C1043	Description:	Harness:	Base Part #:
	PARK/TURN LAMP, RIGHT FRONT	13105_P	13411

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	57 (BK)	20	Ground	
2	14 (BN)	20	Power, Exterior lamps	
3	2 (WH-LB)	18	Right turn signal	

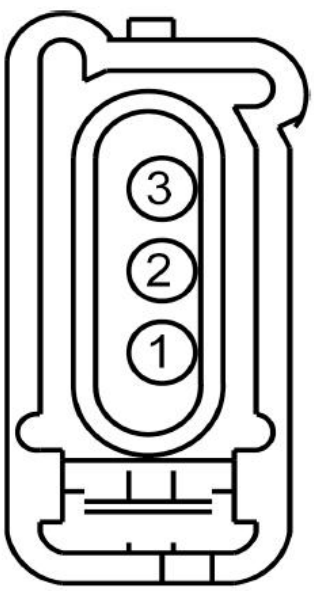

Fig. 219: Identifying Connector C1043 (Park/Turn Lamp, Right Front)
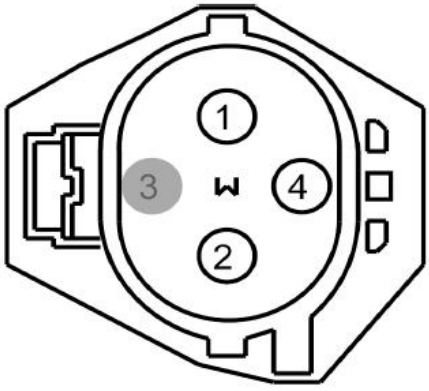
Courtesy of FORD MOTOR CO.

Connector: C1048

Description:	Harness:	Base Part #:
ENGINE COOLING FAN MODULE	14290	



Pin	Circuit	Gauge	Circuit Function	Qualifier
1	1153 (RD-BK)	10	Voltage supplied at all times (overload protected)	
2	57 (BK)	10	Ground	
3	*	*	not used	
4	229 (RD-OG)	20	Engine cooling fan motor control	

Fig. 220: Identifying Connector C1048 (Engine Cooling Fan Module)
Courtesy of FORD MOTOR CO.

Connector: C1068

Description:	Harness:	Base Part #:
EGR SYSTEM MODULE (ESM)	12B637	

Pin: 1 - 360(BN-PK) - EGR Vacuum regulator signal, Gauge: 20

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	360 (BN-PK)	20	EGR Vacuum regulator signal	
2	351 (BN-WH)	20	Reference voltage	
3	3067 (LB-RD)	20	Manifold Absolute Pressure (MAP) sensor input	
4	391 (RD-YE)	20	Voltage supplied at Start and Run (overload protected)	
5	352 (BN-LG)	20	Differential Pressure Feedback EGR (DPFE) sensor input	
6	359 (GY-RD)	20	Signal return	

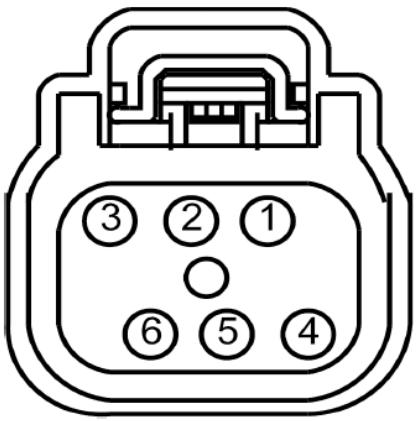


Fig. 221: Identifying Connector C1068 (EGR System Module (ESM))
Courtesy of FORD MOTOR CO.

Connector: C1073	Description:	Harness:	Base Part #:
	FUEL RAIL PRESSURE/TEMPERATURE SENSOR	12B637	

Pin: 3 - 1164(LB) - Fuel rail temperature sensor signal, Gauge: 20

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	141 (RD-PK)	20	Fuel rail pressure sensor signal	
2	351 (BN-WH)	20	Reference voltage	
3	1164 (LB)	20	Fuel rail temperature sensor signal	
4	359 (GY-RD)	20	Signal return	

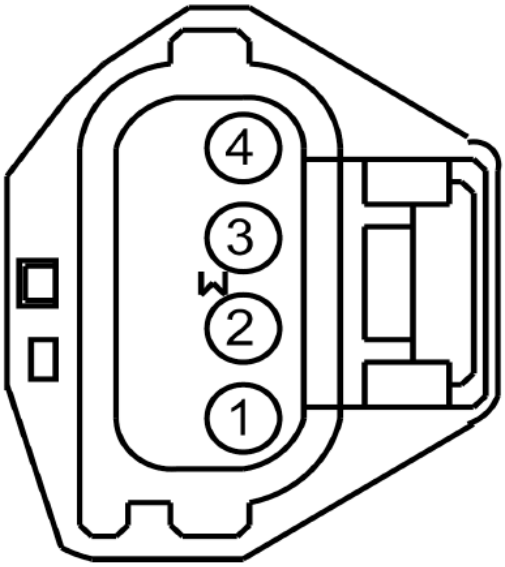

Fig. 222: Identifying Connector C1073 (Fuel Rail Pressure/Temperature Sensor)
Courtesy of FORD MOTOR CO.

Connector: C1081	Description:	Harness:	Base Part #:
	A/C LOW PRESSURE SWITCH	12B637	19E561

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	883 (PK-LB)	20	A/C Low pressure switch signal	
2	*	*	not used	
3	*	*	not used	
4	348 (VT)	20	A/C demand signal	

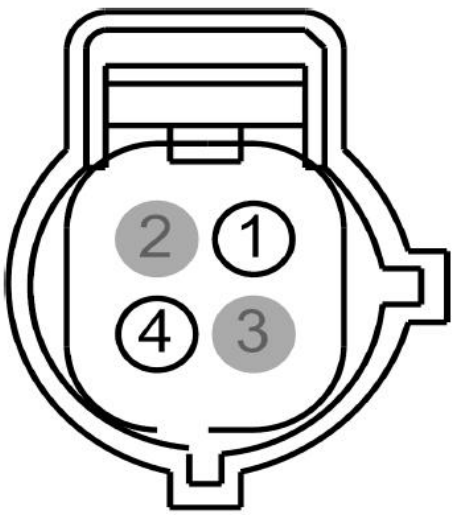

Fig. 223: Identifying Connector C1081 (A/C Low Pressure Switch)
Courtesy of FORD MOTOR CO.

Connector: C1100A	Description:	Harness:	Base Part #:
	BATTERY	14B060	

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	2037 (RD)	04	Battery cable +	

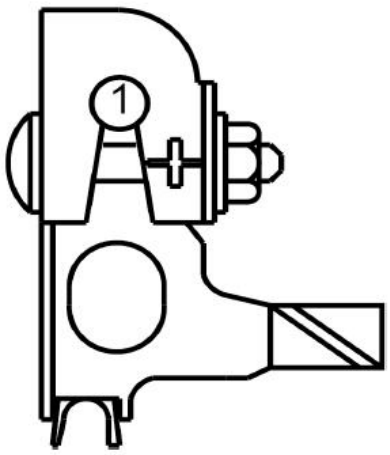

Fig. 224: Identifying Connector C1100A (Battery)
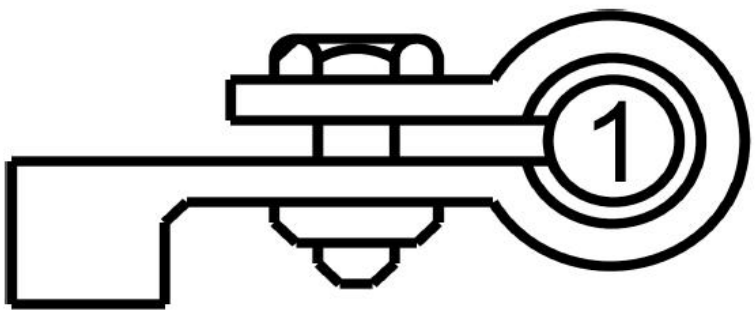
Courtesy of FORD MOTOR CO.

Connector: C1100B	Description:	Harness:	Base Part #:
	BATTERY	14B060	



Pin	Circuit	Gauge	Circuit Function	Qualifier
1	2057 (BK)	04	Battery cable -	

Fig. 225: Identifying Connector C1100B (Battery)
Courtesy of FORD MOTOR CO.

Connector: C1107	Description:	Harness:	Base Part #:
	OUTPUT SHAFT SPEED (OSS) SENSOR	12B637	7M101

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	359 (GY-RD)	20	Signal return	
2	136 (DB-YE)	20	Output shaft speed (OSS) sensor signal	

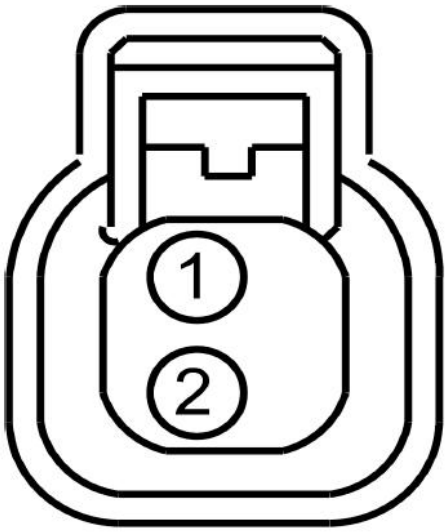


Fig. 226: Identifying Connector C1107 (Output Shaft Speed (OSS) Sensor)
Courtesy of FORD MOTOR CO.

Connector: C1113	Description:	Harness:	Base Part #:
	PARKING LAMP, LEFT FRONT	15A219	

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	14 (BN)	20	Power, Exterior lamps	
2	57 (BK)	20	Ground	

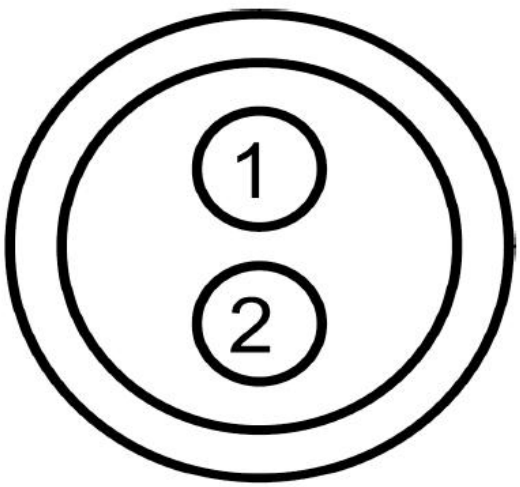

Fig. 227: Identifying Connector C1113 (Parking Lamp, Left Front)
Courtesy of FORD MOTOR CO.

Connector: C1114

Description:	Harness:	Base Part #:
PARKING LAMP, RIGHT FRONT	15A219	

Pin: 2 - 57(BK) - Ground, Gauge: 20

Pin	Circuit	Gauge	Circuit Function Qualifier
1	14 (BN)	20	Power, Exterior lamps
2	57 (BK)	20	Ground

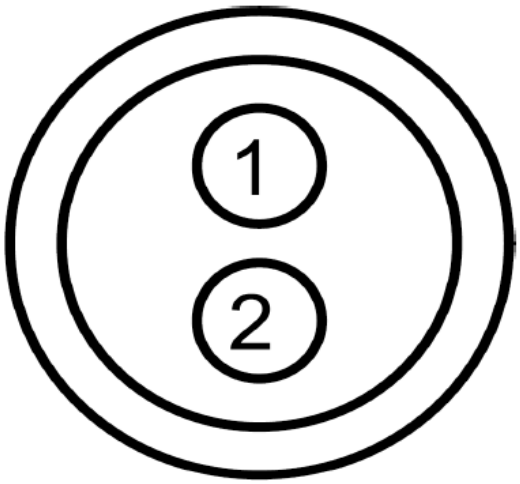

Fig. 228: Identifying Connector C1114 (Parking Lamp, Right Front)
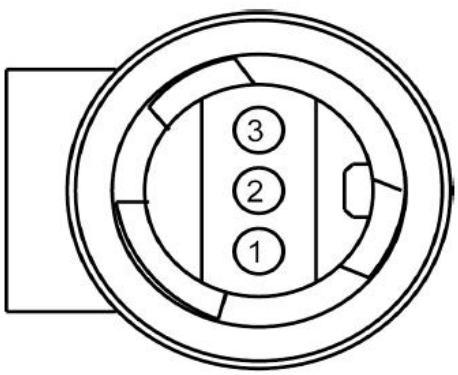
Courtesy of FORD MOTOR CO.

Connector: C1115

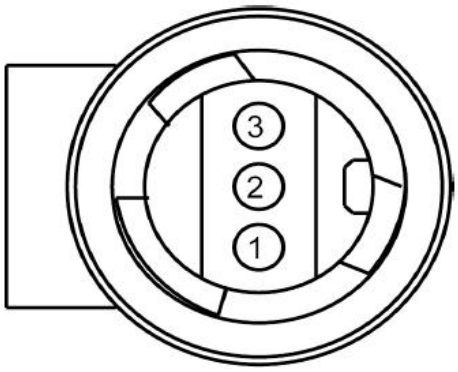
Description:	Harness:	Base Part #:
PARK/ TURN LAMP, LEFT FRONT	15A219	13411



Pin	Circuit	Gauge	Circuit Function Qualifier
1	57 (BK)	20	Ground
2	14 (BN)	20	Power, Exterior lamps
3	3 (LG-WH)	20	Left turn signal

Fig. 229: Identifying Connector C1115 (Park/ Turn Lamp, Left Front)
Courtesy of FORD MOTOR CO.

Connector: C1116	Description:	Harness:	Base Part #:
	PARK/ TURN LAMP, RIGHT FRONT	15A219	13411



Pin	Circuit	Gauge	Circuit Function	Qualifier
1	57 (BK)	20	Ground	
2	14 (BN)	20	Power, Exterior lamps	
3	2 (WH-LB)	20	Right turn signal	

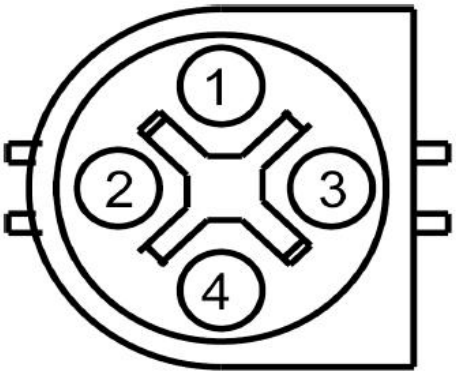
Fig. 230: Identifying Connector C1116 (Park/ Turn Lamp, Right Front)
Courtesy of FORD MOTOR CO.

Connector: C1120	Description:	Harness:	Base Part #:
	CRANKSHAFT POSITION SENSOR	12B637	6C315

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	139 (GY-YE)	20	Crankshaft position sensor -	
2	138 (BK-PK)	20	Crankshaft postion sensor +	

Fig. 231: Identifying Connector C1120 (Crankshaft Position Sensor)
Courtesy of FORD MOTOR CO.

Connector: C1179	Description:	Harness:	Base Part #:
	AIR SUSPENSION COMPRESSOR ASSEMBLY	14290	



Pin	Circuit	Gauge	Circuit Function	Qualifier
1	57 (BK)	12	Ground	
2	538 (GY-RD)	12	Air suspension compressor relay switched power	
3	57 (BK)	18	Ground	
4	421 (PK)	18	Air suspension compressor, vent	

Fig. 232: Identifying Connector C1179 (Air Suspension Compressor Assembly)
Courtesy of FORD MOTOR CO.

Connector: C1191	Description:	Harness:	Base Part #:
	POWER STEERING PRESSURE SWITCH	12B637	

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	330 (YE-LG)	20	Power steering pressure switch signal	
2	359 (GY-RD)	20	Signal return	

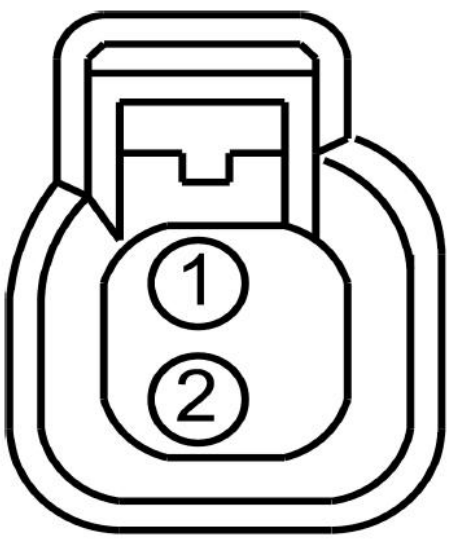


Fig. 233: Identifying Connector C1191 (Power Steering Pressure Switch)
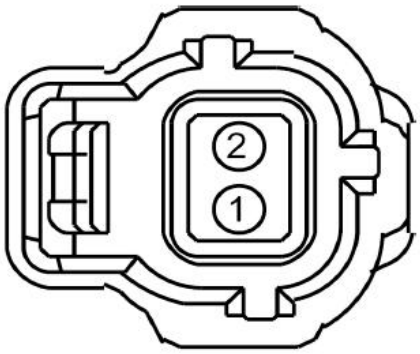
Courtesy of FORD MOTOR CO.

Connector: C1195	Description:	Harness:	Base Part #:
	EVAP CANISTER PURGE VALVE	12B637	



Pin	Circuit	Gauge	Circuit Function	Qualifier
1	391 (RD-YE)	20	Voltage supplied at Start and Run (overload protected)	
2	191 (LG-BK)	20	EVAP Canister purge valve control	

Fig. 234: Identifying Connector C1195 (EVAP Canister Purge Valve)
Courtesy of FORD MOTOR CO.

Connector: C1196	Description:	Harness:	Base Part #:
	IGNITION TRANSFORMER CAPACITOR	12B637	

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	1118 (RD)	20	Ignition coils relay switched power	

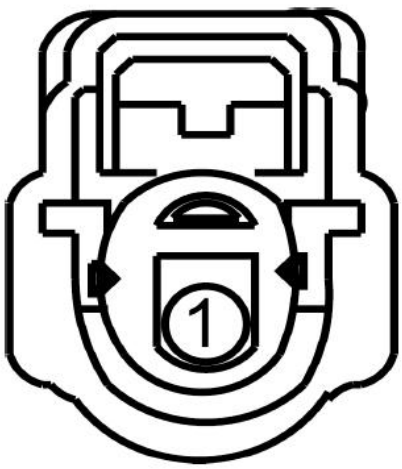


Fig. 235: Identifying Connector C1196 (Ignition Transformer Capacitor)
Courtesy of FORD MOTOR CO.

Connector: C1227

Description:	Harness:	Base Part #:
FRONT BLOWER MOTOR	14290	19805

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	371 (PK-WH)	10	Blower motor relay switched power	
2	261 (OG-BK)	10	Blower motor speed control	
2	515 (OG-RD)	10	Front blower motor speed control	

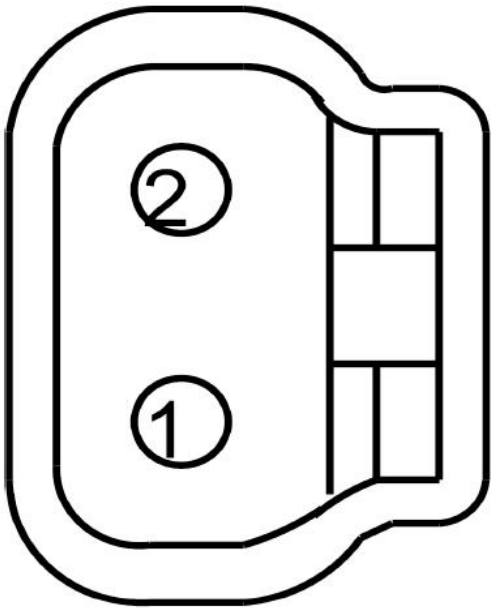

Fig. 236: Identifying Connector C1227 (Front Blower Motor)
Courtesy of FORD MOTOR CO.

Connector: C1260

Description:	Harness:	Base Part #:
A/C PRESSURE TRANSDUCER SENSOR	12B637	

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	359 (GY-RD)	20	Signal return	
2	351 (BN-WH)	20	Reference voltage	
3	1154 (WH-BK)	20	A/C pressure transducer sensor signal	
4	*	*	not used	

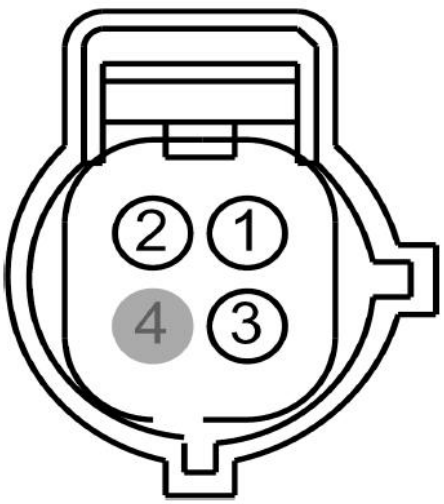

Fig. 237: Identifying Connector C1260 (A/C Pressure Transducer Sensor)
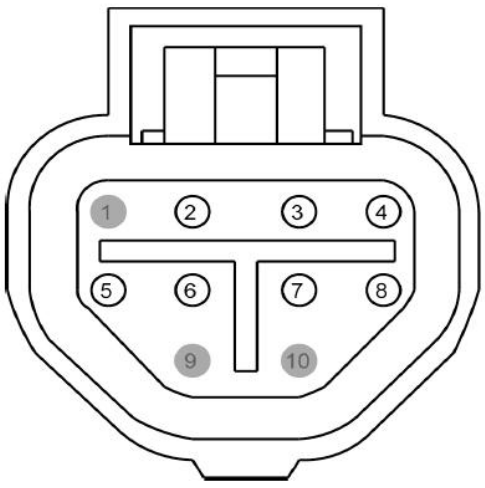
Courtesy of FORD MOTOR CO.

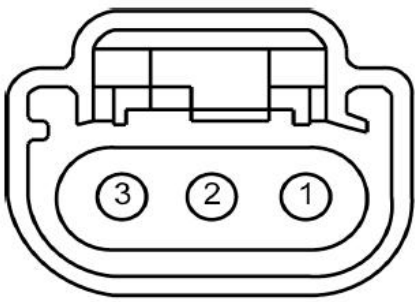
Connector: C1274	Description:	Harness:	Base Part #:
	4R70E TRANSMISSION	12B637	7A091



Pin	Circuit	Gauge	Circuit Function	Qualifier
1	*	*	not used	
2	359 (GY-RD)	20	Signal return	
3	126 (VT-YE)	20	Torque Converter Clutch (TCC) solenoid	
4	391 (RD-YE)	20	Voltage supplied at Start and Run (overload protected)	
5	923 (OG-BK)	20	Transmission Fluid Temperature (TFT) sensor	
6	925 (WH-YE)	20	Electronic Pressure Control (EPC) solenoid	
7	237 (OG-YE)	20	Shift solenoid A	
8	315 (VT-OG)	20	Shift solenoid B	
9	*	*	not used	
10	*	*	not used	

Fig. 238: Identifying Connector C1274 (4R70E Transmission)
Courtesy of FORD MOTOR CO.

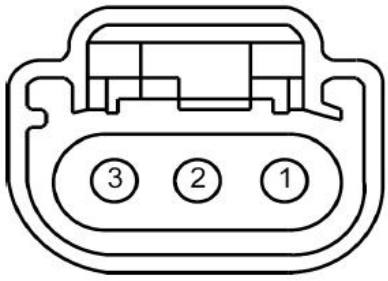
Connector: C1284	Description:	Harness:	Base Part #:
	HEADLAMP, LEFT	14290	



Pin	Circuit	Gauge	Circuit Function	Qualifier
1	160 (DB-WH)	20	Headlamp, left Low beam lamp feed	
2	57 (BK)	16	Gound	
3	1337 (VT-YE)	20	Headlamp, left high beam lamp feed	

Fig. 239: Identifying Connector C1284 (Headlamp, Left)
Courtesy of FORD MOTOR CO.

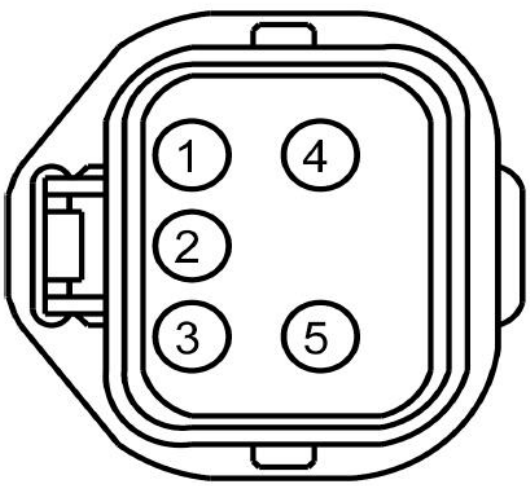
Connector: C1285	Description:	Harness:	Base Part #:
	HEADLAMP, RIGHT	14290	



Pin	Circuit	Gauge	Circuit Function	Qualifier
1	161 (DG-OG)	20	Headlamp, right low beam lamp feed	
2	57 (BK)	16	Ground	
3	1335 (YE-WH)	20	Headlamp, right high beam lamp feed	

Fig. 240: Identifying Connector C1285 (Headlamp, Right)
Courtesy of FORD MOTOR CO.

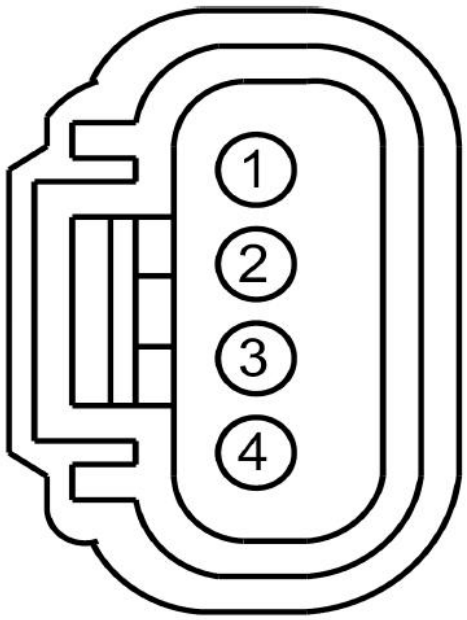
Connector: C1308	Description:	Harness:	Base Part #:
	FRONT BLOWER MOTOR SPEED CONTROLLER	14290	19E624



Pin	Circuit	Gauge	Circuit Function	Qualifier
1	260 (OG-BK)	20	Blower motor speed controller input	
2	752 (YE-RD)	20	Blower motor speed control, common	
3	754 (LG-WH)	20	Blower motor speed control, high	
4	515 (OG-RD)	10	Front blower motor speed control	
5	57 (BK)	10	Ground	

Fig. 241: Identifying Connector C1308 (Front Blower Motor Speed Controller)
Courtesy of FORD MOTOR CO.

Connector: C1349 | Description: FRONT BLOWER MOTOR RESISTER ASSEMBLY | Harness: 14290 | Base Part #: 19A706

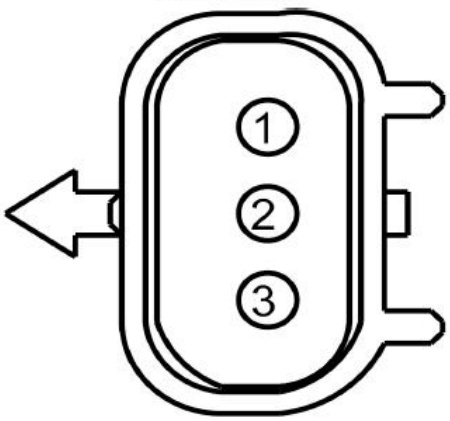


Pin	Circuit	Gauge	Circuit Function	Qualifier
1	754 (LG-WH)	12	Blower motor speed control, high	
2	57 (BK)	12	Ground	
3	752 (YE-RD)	12	Blower motor speed control, common	
4	261 (OG-BK)	12	Blower motor speed control	

Fig. 242: Identifying Connector C1349 (Front Blower Motor Resister Assembly)
Courtesy of FORD MOTOR CO.

Inline: C1352 | Description: Inline | Base Part #:

MALE
Harness: 14290



FEMALE
Harness:

Pin	Circuit	Gauge	Qualifier
1	1335 (YE-WH)	20	
2	1337 (VT-YE)	20	
3	165 (TN-WH)	20	

Fig. 243: Identifying Connector C1352 (Inline)
Courtesy of FORD MOTOR CO.

Connector: C1365

Description:	Harness:	Base Part #:
WIG/WAG MODULE	15A599	

Pin: C - 57(BK) - Ground, Gauge: 16

Pin	Circuit	Gauge	Circuit Function	Qualifier
A	7 (LG-YE)	16	R2.A2 relay switched power	
B	1335 (YE-WH)	16	Headlamp, left high beam lamp feed	
C	57 (BK)	16	Ground	
D	1337 (VT-YE)	16	Headlamp, left high beam lamp feed	

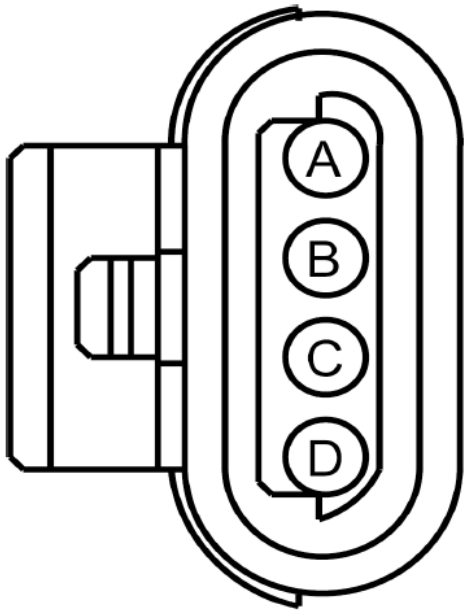


Fig. 244: Identifying Connector C1365 (WIG/WAG Module)
Courtesy of FORD MOTOR CO.

Connector: C1368

Description:	Harness:	Base Part #:
ELECTRONIC THROTTLE CONTROL (ETC) MOTOR	12B637	

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	1835 (DB-YE)	20	Electronic throttle control motor +/-	
2	1836 (OG-YE)	20	Electronic throttle control motor +/-	

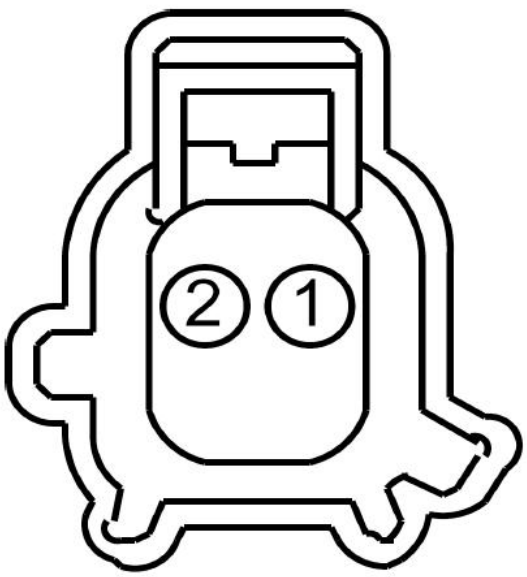

Fig. 245: Identifying Connector C1368 (Electronic Throttle Control (ETC) Motor)
Courtesy of FORD MOTOR CO.

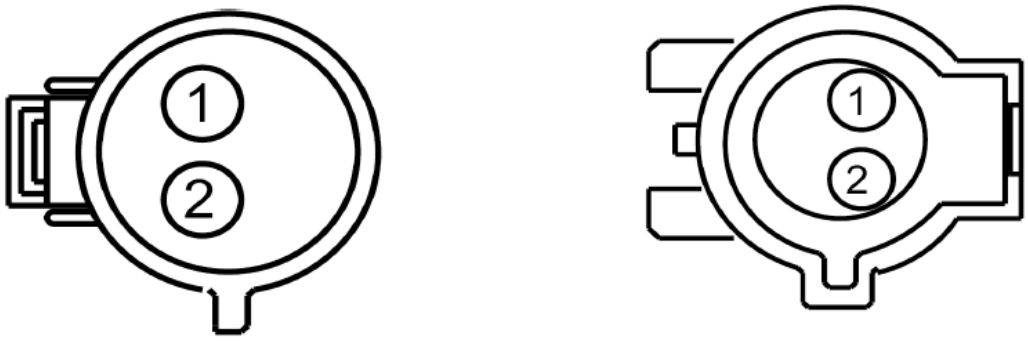
Inline: C1386

Description:
Inline

Base Part #:

MALE
Harness: 14290

FEMALE
Harness: 15A211



Pin: 2 - 57(BK) - Ground, Gauge: 20

Pin	Circuit	Gauge	Qualifier
1	478 (TN-OG)	18	15A211_R
1	478 (TN-OG)	20	14290
2	57 (BK)	20	

Fig. 246: Identifying Connector C1386 (Inline)
Courtesy of FORD MOTOR CO.

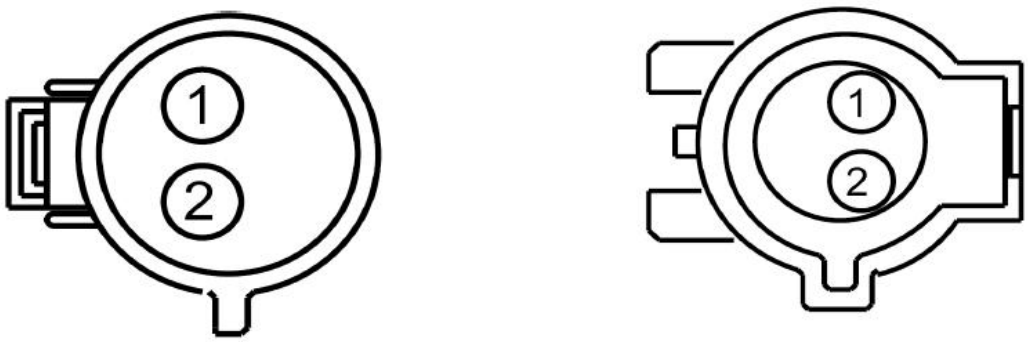
Inline: C1393

Description:
Inline

Base Part #:

MALE
Harness: 14290

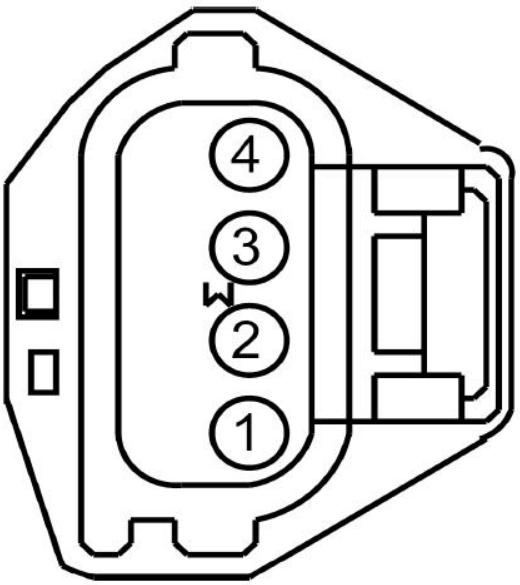
FEMALE
Harness: 15A211



Pin	Circuit	Gauge	Qualifier
1	478 (TN-OG)	18	15A211_L
1	478 (TN-OG)	20	14290
2	57 (BK)	20	

Fig. 247: Identifying Connector C1393 (Inline)
Courtesy of FORD MOTOR CO.

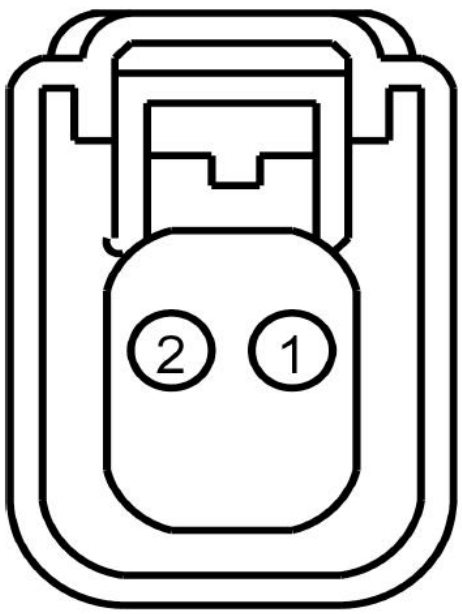
Connector: C1449	Description:	Harness:	Base Part #:
	ELECTRONIC THROTTLE CONTROL (ETC) MODULE	12B637	9B989



Pin	Circuit	Gauge	Circuit Function	Qualifier
1	357 (YE-WH)	20	Throttle position (TPS) sensor signal 2	
2	1857 (YE-WH)	20	Electronic throttle control module reference voltage	
3	1858 (PK-OG)	20	Electronic throttle control module signal return	
4	355 (GY-WH)	20	Throttle position (TPS) sensor signal 1	

Fig. 248: Identifying Connector C1449 (Electronic Throttle Control (ETC) Module)
Courtesy of FORD MOTOR CO.

Connector: C1465	Description:	Harness:	Base Part #:
	FRONT IMPACT SEVERITY SENSOR, LEFT	14290	



Pin	Circuit	Gauge	Circuit Function	Qualifier
1	617 (PK-OG)	20	Front impact severity sensor feed	
2	618 (VT-LG)	20	Front impact severity sensor return	

Fig. 249: Identifying Connector C1465 (Front Impact Severity Sensor, Left)
Courtesy of FORD MOTOR CO.

Connector: C1466 | Description: FRONT IMPACT SEVERITY SENSOR, RIGHT | Harness: 14290 | Base Part #:

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	619 (PK-WH)	20	Air bag crash sensor #2 feed	
2	620 (VT-LB)	20	Air bag crash sensor #2 ground monitor	

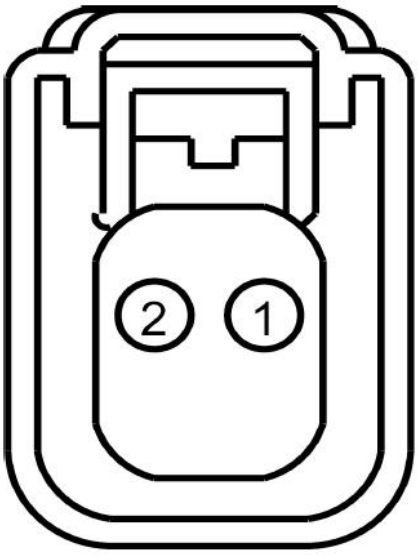


Fig. 250: Identifying Connector C1466 (Front Impact Severity Sensor, Right)
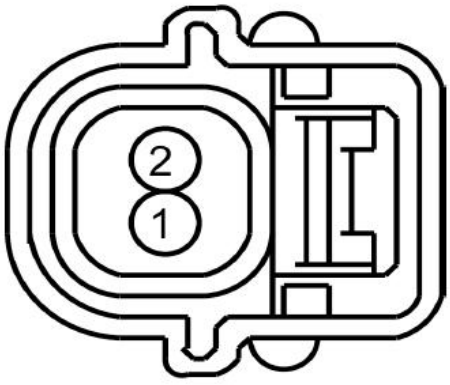
Courtesy of FORD MOTOR CO.

Connector: C1470 | Description: HEATED PCV | Harness: 12B637 | Base Part #:



Pin	Circuit	Gauge	Circuit Function	Qualifier
1	391 (RD-YE)	20	Voltage supplied at Start and Run (overload protected)	
2	369 (WH-OG)	20	Heated PCV control	

Fig. 251: Identifying Connector C1470 (Heated PCV)
Courtesy of FORD MOTOR CO.

Connector: C1471	Description:	Harness:	Base Part #:
	SIREN SPEAKER	15A599	

Pin	Circuit	Gauge	Circuit Function	Qualifier
A	13 (RD-BK)	16	siren +	
B	14 (BN)	16	Power, Exterior lamps	

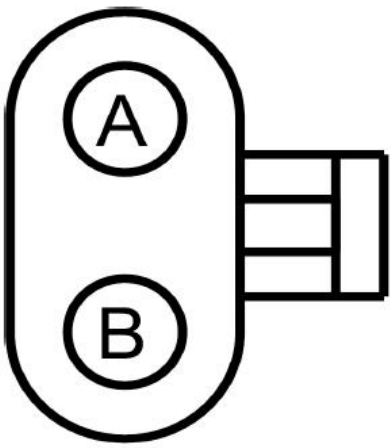


Fig. 252: Identifying Connector C1471 (Siren Speaker)
Courtesy of FORD MOTOR CO.

Connector: C1478	Description:	Harness:	Base Part #:
	LEFT FRONT STROBE ASSEMBLY	15A599	

Pin	Circuit	Gauge	Circuit Function	Qualifier
A	361 (RD)	16	Voltage supplied in Start and Run (overload protected)	
B	188 (WH-BK)	16	Left front strobe -	
C	57 (BK)	16	Ground	

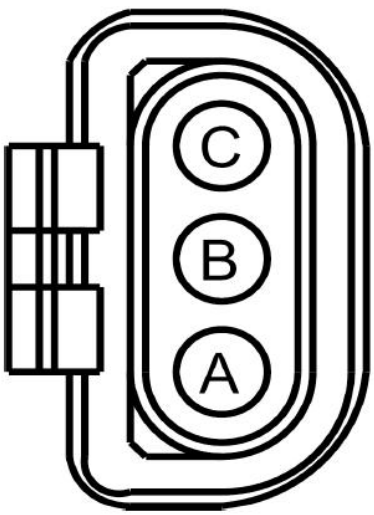

Fig. 253: Identifying Connector C1478 (Left Front Strobe Assembly)
Courtesy of FORD MOTOR CO.

Connector: C1479 | **Description:** RIGHT FRONT STROBE ASSEMBLY | **Harness:** 15A599 | **Base Part #:**

Pin	Circuit	Gauge	Circuit Function	Qualifier
A	361 (RD)	16	Voltage supplied in Start and Run (overload protected)	
B	1055 (WH-LG)	16	Voltage supplied at all times (overload protected)	
C	57 (BK)	16	Ground	

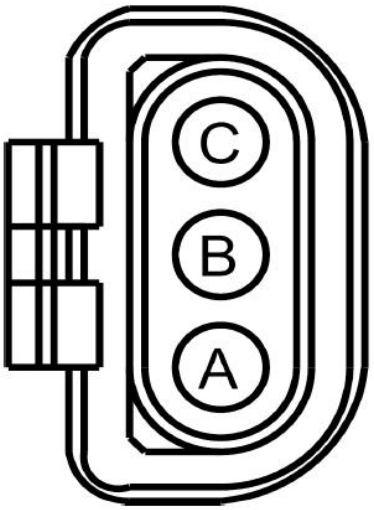

Fig. 254: Identifying Connector C1479 (Right Front Strobe Assembly)
Courtesy of FORD MOTOR CO.

Connector: C1480 | **Description:** LEFT GRILLE STROBE ASSEMBLY | **Harness:** 15A599 | **Base Part #:**

Pin	Circuit	Gauge	Circuit Function	Qualifier
A	361 (RD)	16	Voltage supplied in Start and Run (overload protected)	
B	385 (WH-RD)	16	Rear flasher relay switched power	
C	57 (BK)	16	Ground	

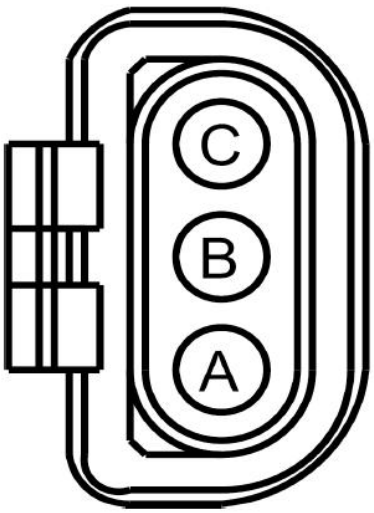

Fig. 255: Identifying Connector C1480 (Left Grille Strobe Assembly)
Courtesy of FORD MOTOR CO.

Connector: C1481 | Description: RIGHT GRILLE STROBE ASSEMBLY | Harness: 15A599 | Base Part #:

Pin: B - 556(WH) - Fuel Injector 2 control, Gauge: 16

Pin	Circuit	Gauge	Circuit Function	Qualifier
A	361 (RD)	16	Voltage supplied in Start and Run (overload protected)	
B	556 (WH)	16	Fuel injector 2 control	
C	57 (BK)	16	Ground	

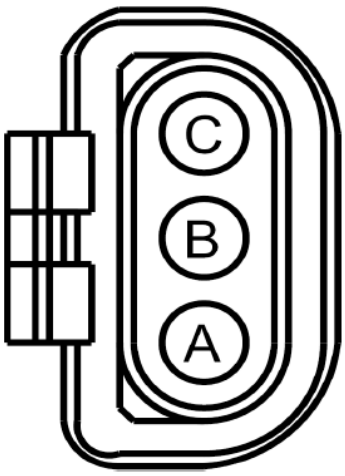

Fig. 256: Identifying Connector C1481 (Right Grille Strobe Assembly)
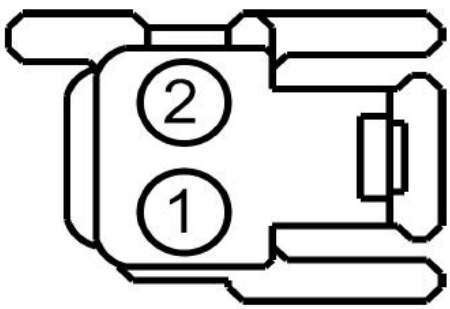
Courtesy of FORD MOTOR CO.

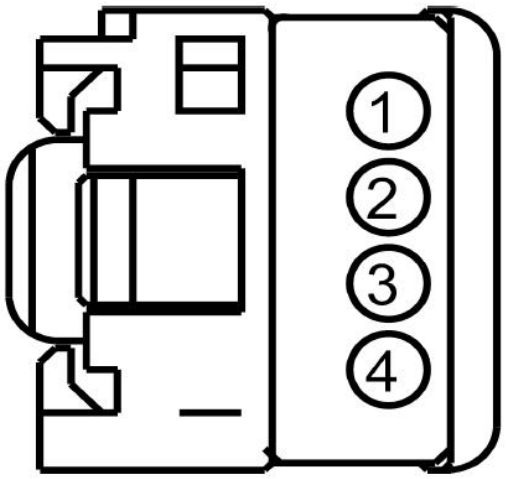
Connector: C2003 | Description: ADJUSTABLE PEDAL MOTOR | Harness: 14A005 | Base Part #: 2C429



Pin	Circuit	Gauge	Circuit Function	Qualifier
1	1495 (WH)	20	Adjustable pedal motor +/-	
2	1494 (RD)	20	Adjustable pedal motor +/-	

Fig. 257: Identifying Connector C2003 (Adjustable Pedal Motor)
Courtesy of FORD MOTOR CO.

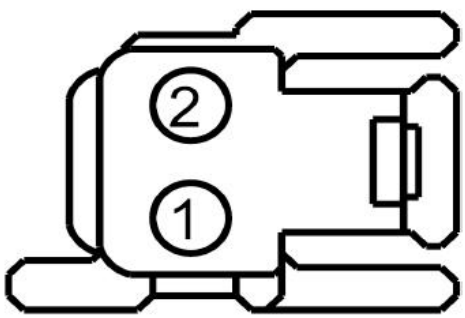
Connector: C2007	Description:	Harness:	Base Part #:
	PASSIVE ANTI-THEFT TRANSCEIVER	14401	



Pin	Circuit	Gauge	Circuit Function	Qualifier
1	1266 (RD-YE)	20	Voltage supplied in Start and Run (overload protected)	
2	676 (PK-OG)	22	Ground	
3	1215 (WH-LG)	22	TX signal	
4	1216 (GY-OG)	22	RX signal	

Fig. 258: Identifying Connector C2007 (Passive Anti-Theft Transceiver)
Courtesy of FORD MOTOR CO.

Connector: C2008	Description:	Harness:	Base Part #:
	BRAKE SHIFT INTERLOCK	14401	3Z719



Pin	Circuit	Gauge	Circuit Function	Qualifier
1	57 (BK)	20	Ground	
2	810 (RD-LG)	22	Brake shift interlock +	

Fig. 259: Identifying Connector C2008 (Brake Shift Interlock)
Courtesy of FORD MOTOR CO.

Connector: C2015	Description:	Harness:	Base Part #:
	PARK BRAKE SWITCH	14A005	15A851

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	409 (TN-BK)	20	Brake fluid level switch signal	
2	57 (BK)	22	Ground	

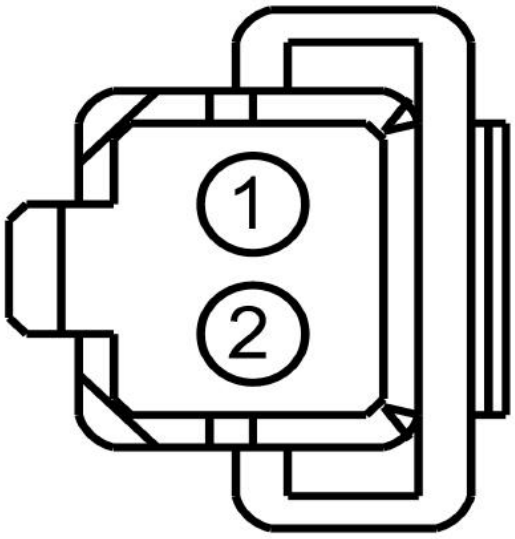


Fig. 260: Identifying Connector C2015 (Park Brake Switch)
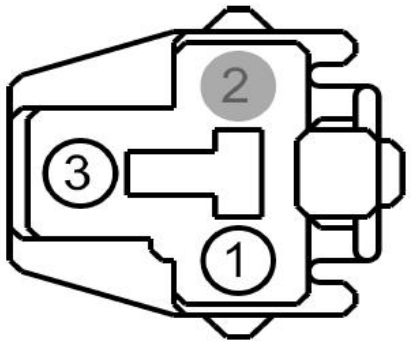
Courtesy of FORD MOTOR CO.

Connector: C2031	Description:	Harness:	Base Part #:
	CIGAR LIGHTER, FRONT	15080	15055



Pin	Circuit	Gauge	Circuit Function	Qualifier
1	40 (LB-WH)	16	Voltage supplied at all times (overload protected)	
2	*	*	not used	
3	57 (BK)	16	Ground	

Fig. 261: Identifying Connector C2031 (Cigar Lighter, Front)
Courtesy of FORD MOTOR CO.

Connector: C2033

Description:	Harness:	Base Part #:
POWER POINT	15080	19N236

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	1049 (BN-PK)	16	Voltage supplied at all times (overload protected)	
2	*	*	not used	
3	57 (BK)	16	Ground	

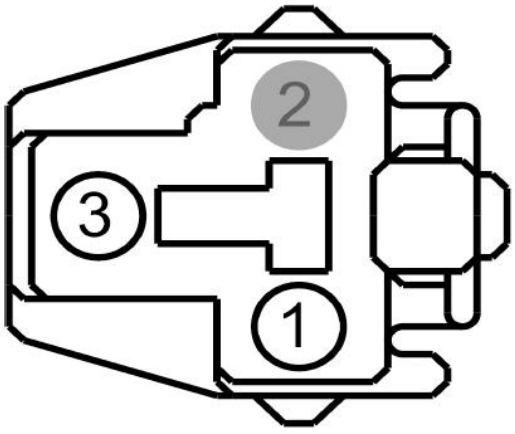


Fig. 262: Identifying Connector C2033 (Power Point)
Courtesy of FORD MOTOR CO.

Connector: C2040

Description:	Harness:	Base Part #:
ACCELERATOR PEDAL POSITION SENSOR	14A005	

Pin: 8 - 3015(WH-RD) - Accelerator pedal position 3 signal, Gauge: 22

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	1284 (TN-WH)	22	Electronic throttle control, signal return	
2	1283 (TN-YE)	22	Accelerator pedal position 1 signal	
3	359 (GY-RD)	22	Signal return	
4	*	*	not used	
5	3012 (WH)	22	Accelerator pedal position 2 signal	
6	3091 (LB-BK)	22	Electronic throttle control, Vref 2	
7	3093 (WH-LB)	22	Electronic throttle control, Vref 1	
8	3015 (WH-RD)	22	Accelerator pedal position 3 signal	

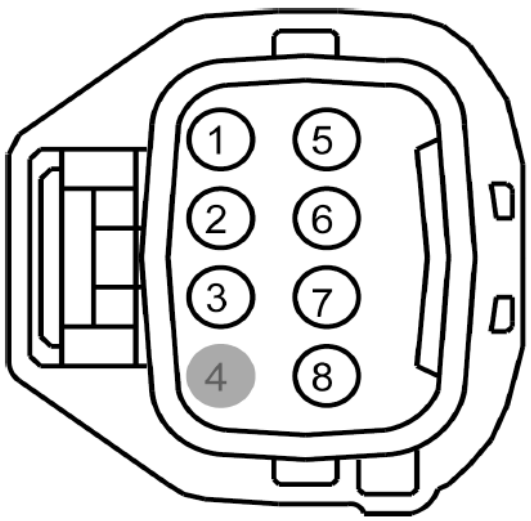

Fig. 263: Identifying Connector C2040 (Accelerator Pedal Position Sensor)
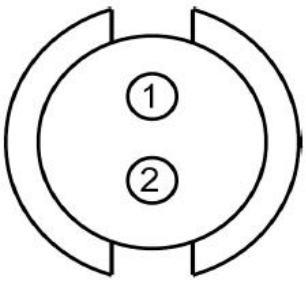
Courtesy of FORD MOTOR CO.

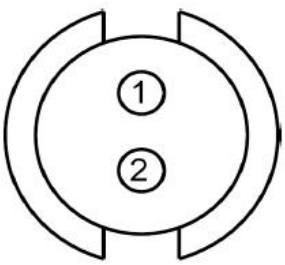
Connector: C2056	Description:	Harness:	Base Part #:
	COURTESY LAMP, LEFT FOOTWELL	14401	



Pin	Circuit	Gauge	Circuit Function Qualifier
1	53 (BK-LB)	20	Courtesy lamps feed
2	57 (BK)	22	Ground

Fig. 264: Identifying Connector C2056 (Courtesy Lamp, Left Footwell)
Courtesy of FORD MOTOR CO.

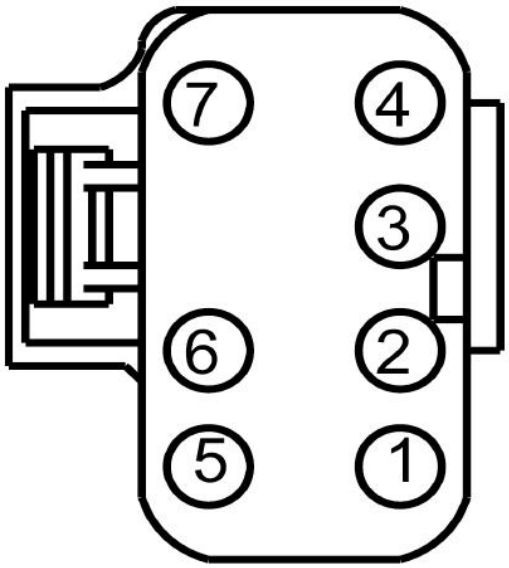
Connector: C2057	Description:	Harness:	Base Part #:
	COURTESY LAMP, RIGHT FOOTWELL	14401	



Pin	Circuit	Gauge	Circuit Function Qualifier
1	53 (BK-LB)	20	Courtesy lamps feed
2	57 (BK)	22	Ground

Fig. 265: Identifying Connector C2057 (Courtesy Lamp, Right Footwell)
Courtesy of FORD MOTOR CO.

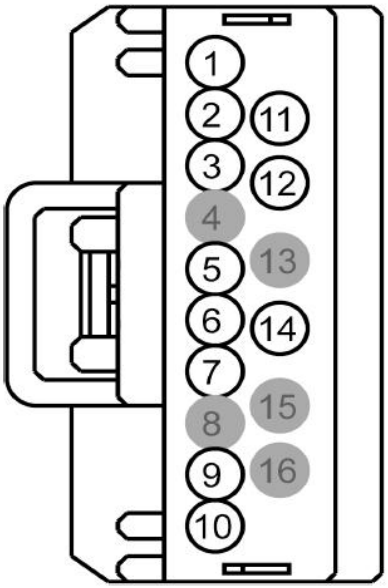
Connector: C2089 | **Description:** ADJUSTABLE PEDAL SWITCH | **Harness:** 14401 | **Base Part #:**



Pin	Circuit	Gauge	Circuit Function	Qualifier
1	1495 (WH)	18	Adjustable pedal motor +/-	
2	1567 (RD-LB)	18	Voltage supplied at all times (overload protected)	
3	57 (BK)	18	Ground	
4	57 (BK)	18	Ground	
5	484 (OG-BK)	18	Switch illumination +	
6	57 (BK)	18	Ground	
7	1494 (RD)	18	Adjustable pedal motor +/-	

Fig. 266: Identifying Connector C2089 (Adjustable Pedal Switch)
Courtesy of FORD MOTOR CO.

Connector: C2131A | **Description:** VEHICLE DYNAMICS MODULE (VDM) | **Harness:** 14290 | **Base Part #:** 3C142



Pin	Circuit	Gauge	Circuit Function	Qualifier
1	115 (LB-YE)	20	Power steering valve solenoid -	
2	114 (LB-YE)	20	Power steering valve solenoid +	
3	1003 (GY-YE)	20	Voltage supplied in Run (overload protected)	
4	*	*	not used	
5	57 (BK)	22	Ground	
6	420 (DB-YE)	20	Air suspension compressor relay control	
7	421 (PK)	20	Air suspension compressor vent	
8	*	*	not used	
9	1828 (PK-LG)	22	HS CAN -	
10	1827 (WH-LG)	22	HS CAN +	
11	418 (DG-YE)	20	Voltage supplied at all times (overload protected)

DESCRIPTION AND OPERATION

BATTERY AND CABLES

Vehicles are equipped with a 12-volt maintenance-free battery.

The battery and cable system consists of the following components:

- Battery
- Battery cable assembly
- Battery tray

Ford Motor Company strongly recommends that lead-acid batteries be returned to an authorized recycling facility for disposal.

Fig. 1: Identifying Lead Acid Battery Recycling Label

Courtesy of FORD MOTOR CO.

DIAGNOSTIC TESTS

BATTERY

Special Tools

Illustration	Tool Name	Tool Number
ST2442-A	Micro 490 Digital Battery Analyzer	162-00004 or equivalent

Principles of Operation

Battery Eye Operation

The purpose of the battery eye is to indicate the state of charge of the battery in the assembly plant and while on the dealership lot. The battery eye can also indicate the state-of-charge when the vehicle is delivered to the dealership and during the pre-delivery inspection process. The battery eye is made up of a viewing plate, 2 balls and a small passage. The balls indicate the specific gravity of the electrolyte by floating higher or lower in the passageway. It is important to note that the battery eye checks the specific gravity on only a single battery cell.

The color of the battery eye indicates the approximate state of charge.

- Red usually indicates the battery state-of-charge is at 40% or less.
- Yellow indicates the battery state-of-charge is between 40% and 57%.
- Green indicates the battery state-of-charge is above 57%.
- No color/black can occur after the battery has been in service for several years and some of the plate material has coated the balls.
- A clear battery eye can occur if the battery case becomes damaged and the electrolyte has fallen below the plates.

NOTE: The battery eye may remain red for a period of time (up to several days), even after the battery is fully charged, because the acid is not yet fully mixed.

Do not install a new battery based solely on the indication of the battery eye. The battery eye color simply indicates the battery state-of-charge, not its condition. For example, a red or yellow battery eye usually indicates the battery is discharged, not defective. If the battery eye indicates the battery may be discharged, it is necessary to recharge the battery before testing its condition.

Charging a Battery

Batteries discharge while the vehicle is on the dealer lot or parked by the customer for an extended period of time due to normal parasitic key-off loads. Also, vehicles still in dealer inventory or in long-term storage may be driven short distances with heavy electrical loads. Over a period of time (30 days or more), this

could result in vehicles having shallow or deeply discharged batteries.

- Deeply discharged - A battery that is drained over a prolonged period of time, such as an unsold vehicle or a vehicle in storage, to the point the battery is dead.
- Shallow discharge - A battery that is drained by leaving an accessory on for several hours or a few days and has a very low charge.

The vehicle's charging system is designed to supply the electrical power needed to maintain the battery near full charge during normal vehicle use. The charging system is not capable of bringing a deeply discharged battery back near full charge in a short amount of time such as allowing the vehicle to idle for 15 minutes to "recharge the battery." Discharged batteries should be charged using an external charger.

NOTE: Battery chargers have improved greatly with the addition of the new generation pulse chargers. These chargers pulse current into the battery, breaking down the sulfation layer on the battery plates and generally reduce charging times to less than an hour.

NOTE: Cold batteries will not readily accept a charge. Therefore, batteries should be allowed to warm to approximately 5°C (41°F) before charging. This may require 4 to 8 hours at room temperature.

The following chart summarizes 2 recommended methods of charging.

Type of Battery Discharge	Pulse Charger	Standard Charger
Deeply discharged	Follow directions supplied with the pulse charger	2 to 8 hours and may take up to an hour to accept initial charge
Shallow discharge	45 minutes to an hour charge	2 hours (40A) on manual setting or medium automatic setting

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Battery • Battery mounting	• Battery cables • Battery posts

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the fault is not visually evident, go to **Pinpoint Test A**.

Pinpoint Tests

Pinpoint Test A: Battery Condition Test

Normal Operation

Battery condition is determined by measuring battery terminal voltage after a specific discharge current is applied for a specified time period.

This pinpoint test is intended to diagnose the following:

- Battery charge
- Battery

PINPOINT TEST A: BATTERY CONDITION TEST

A1 TEST THE BATTERY CONDITION

NOTE: No battery with a red test-eye should be replaced. The red eye only means the battery is discharged, not necessarily defective.

NOTE: Failure to fully charge the battery before retesting may cause false readings.

- Verify the battery condition using the battery analyzer.
- **Is the battery OK?**

  YES : If the meter reads GOOD BATTERY, RETURN the battery to service.

  If the meter reads GOOD-RECHARGE, CHARGE the battery and RETURN it to service.

  If the meter reads CHARGE & RETEST, fully CHARGE and RETEST the battery.

  NO : If the meter reads REPLACE BATTERY, INSTALL a new battery.

  If the meter reads BAD CELL-REPLACE, INSTALL a new battery.

GENERAL PROCEDURES

BATTERY DISCONNECT

WARNING: Batteries contain sulfuric acid and produce explosive gases. Work in a well-ventilated area. Do not allow the battery to come in contact with flames, sparks or burning substances. Avoid contact with skin, eyes or clothing. Shield eyes when working near the battery to protect against possible splashing of acid solution. In case of acid contact with skin or eyes, flush immediately with water for a minimum of 15 minutes, then get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in serious personal injury.

WARNING: Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors,

instrument panel, console, door latches, strikers, seats and hood latches.

Refer to the Description and Operation portion of SUPPLEMENTAL RESTRAINT SYSTEM article for location of the RCM and impact sensor (s).

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

WARNING: Always lift a plastic-cased battery with a battery carrier or with hands on opposite corners. Excessive pressure on the battery end walls may cause acid to flow through the vent caps, resulting in personal injury and/or damage to the vehicle or battery.

CAUTION: If equipped with the CD6 audio unit, precautions must be taken when the battery has been disconnected. When reconnecting the battery, make sure no interruption of power occurs for 30 seconds. If power is interrupted during the first 30 seconds, permanent damage to the CD6 audio unit will result.

NOTE: When the battery (or PCM) is disconnected and connected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The charging system setpoint may also vary. The vehicle may need to be driven to relearn its strategy.

NOTE: When the battery is disconnected and connected, the illumination display needs to be calibrated. After the battery is connected, rotate the dimmer switch from the lowest dim position to the full bright, dome ON position.

CAUTION: Do not lift the battery ground terminal by grabbing onto the wire or damage to the wire or terminal may result.

1. Disconnect the battery negative cable.
   - To connect, tighten to 5 Nm (44 lb-in).

CAUTION: Do not lift the positive battery terminal by grabbing onto the wire or lifting underneath the terminal cover or damage to the wire or terminal may result.

2. Disconnect the positive battery cable.
   - To connect, tighten to 6 Nm (53 lb-in).

CAUTION: Do not tap, press or excessively push on the battery terminals or damage to the terminals may result.

NOTE: Make sure the battery terminals slide all of the way down the battery post and the battery terminals are not tilted.

3. To connect, reverse the disconnect procedure.

REMOVAL AND INSTALLATION

BATTERY AND BATTERY TRAY - EXPLODED VIEW

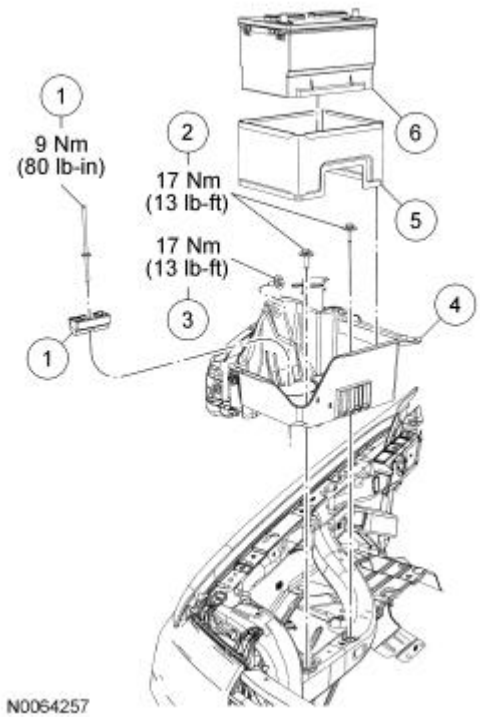

Fig. 2: Exploded View Of Battery & Battery Tray (With Torque Specifications)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	10747	Battery hold-down clamp and bolt
2	N811866	Battery tray bolts (2 required)
3	N811866	Battery tray bolt
4	10732	Battery tray
5	10A687	Battery heat shield
6	10655	Battery

1. For additional information, refer to the procedures.

BATTERY

REMOVAL AND INSTALLATION

1. Disconnect the battery cables. For additional information, refer to **Battery Disconnect**.
2. Loosen and remove the battery hold-down bolt and clamp.
    - To install, tighten to 9 Nm (80 lb-in).

WARNING: Always lift a plastic-cased battery with a battery carrier or with hands on opposite corners. Excessive pressure on the battery end walls may cause acid to flow through the vent caps, resulting in personal injury and/or damage to the vehicle or battery.

3. Remove the battery and the heat shield.
4. To install, reverse the removal procedure.

BATTERY TRAY

REMOVAL AND INSTALLATION

1. Remove the battery. For additional information, refer to **Battery**.

NOTE: The battery tray is integrated with the washer reservoir and cannot be serviced separately.

2. Remove the battery tray. For additional information refer to Washer Reservoir in **WIPERS AND WASHERS** article.

BATTERY CABLES

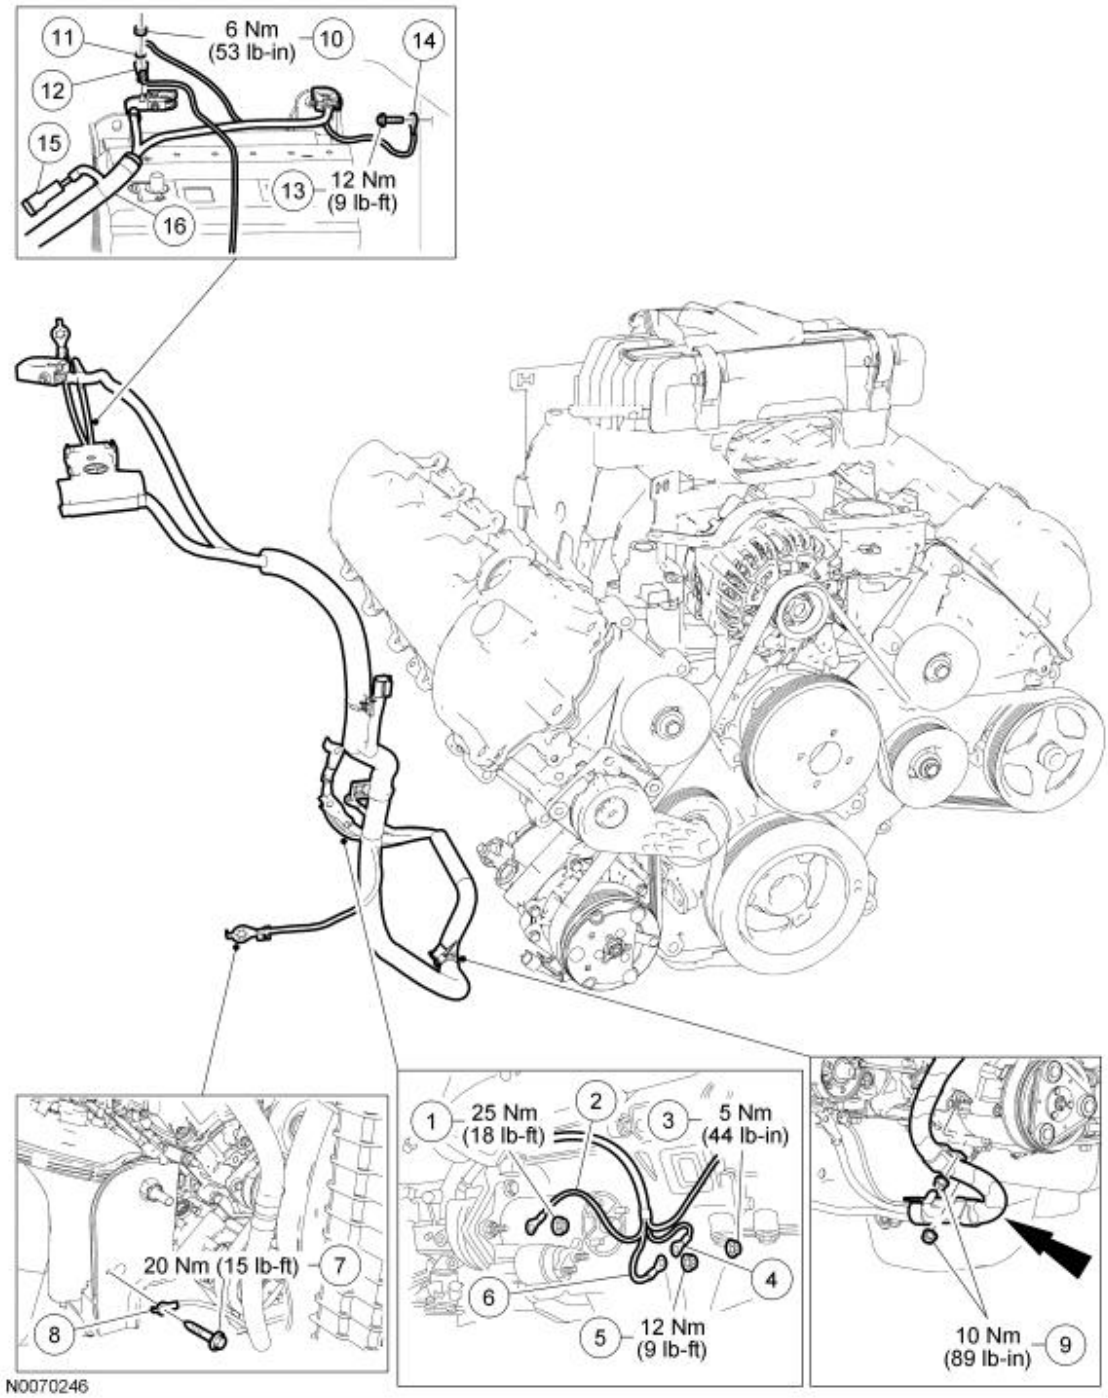

Fig. 3: Exploded View Of Battery Cables (With Torque Specifications)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	N805024	Battery ground cable nut
2	-	Battery ground cable terminal (part of 14B060)
3	N805320	Starter solenoid wire nut
4	-	Starter solenoid wire terminal (part of 14B060)

5	W706414	Starter solenoid positive cable nut
6	-	Starter solenoid positive cable terminal (part of 14B060)
7	-	Battery ground cable-to-frame bolt (part of 14B060)
8	-	Battery ground cable frame terminal (part of 14B060)
9	N621906	Battery cable harness bracket nuts (2 required)
10	W520101	Generator harness terminal/central junction box (CJB) cable nut
11	-	CJB cable terminal (part of 14300)
12	-	Generator harness terminal (part of 14305)
13	N806925	Battery ground cable-to-cowl panel bolt
14	-	Battery ground cable-to-body terminal (part of 14B060)
15	-	Battery cable harness in-line electrical connector (part of 14B060)
16	14B060	Battery cable harness assembly

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Disconnect the battery. For additional information, refer to **Battery Disconnect**.
3. Remove the nut and position the battery ground cable terminal aside at the starter.
   - To install, tighten to 25 Nm (18 lb-ft).
4. Remove the nut and position the starter solenoid positive cable terminal aside.
   - To install, tighten to 12 Nm (9 lb-ft).
5. Remove the nut and position the starter solenoid wire terminal aside.
   - To install, tighten to 5 Nm (44 lb-in).
6. Remove the 2 nuts and position the 2 battery cable harness brackets from the A/C compressor mounting bolts.
   - To install, tighten to 10 Nm (89 lb-in).
7. Remove the bolt and position the battery ground cable-to-frame terminal aside.
   - To install, tighten to 20 Nm (15 lb-ft).
8. Remove the nut and position the generator harness terminal and the central junction box (CJB) cable terminal aside.
   - To install, tighten to 6 Nm (53 lb-in).
9. Remove the bolt and position the battery ground cable-to-cowl panel terminal aside.
   - To install, tighten to 12 Nm (9 lb-ft).
10. Disconnect the battery cable harness in-line electrical connector, release the harness locator and remove the battery cable harness assembly.
11. To install, reverse the removal procedure.

2007 GENERAL INFORMATION

Charging System - General Information - Expedition, Expedition EL, Navigator & Navigator L

SPECIFICATIONS

GENERAL SPECIFICATIONS

GENERAL SPECIFICATIONS

Item	Specification
Generator amps	89/157 amp (max) @ 1,800-6,000 generator rpm, approximately 500-2,000 engine rpm
Voltage	12 volts

DESCRIPTION AND OPERATION

CHARGING SYSTEM

The charging system consists of the following:

- Generator
- Charging system warning indicator
- Necessary wiring and cables

The charging system is a negative ground system. The generator (including an internal voltage regulator) is belt-driven by the engine accessory drive system. When the engine is started, the generator begins to generate AC, which is internally converted to DC. This current is then supplied to the vehicle electrical system through the output (B+) terminal of the generator.

Battery

The battery is a 12V DC source connected in a negative ground system. The battery case is sealed with 2 vent holes to release gases. The battery has 3 major functions:

- Engine cranking power source
- Voltage stabilizer for the electrical system
- Temporary power source when electrical loads exceed the generator output current

DIAGNOSTIC TESTS

CHARGING SYSTEM

Special Tools

Illustration	Tool Name	Tool Number
	73III Automotive Meter	105-R0057 or equivalent

ST1137-A		
ST2173-A	SABRE Premium Battery & Electrical System Tester	010-00736 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
ST2574-A	Flex Probe Kit	105-R025B or equivalent

Principles of Operation

The PCM controlled charging system determines the optimal voltage setpoint for the charging system and communicates this information to the voltage regulator. This system is unique in that it has 2 communication lines between the PCM and the generator/regulator. Both of these communication lines are pulse-width modulated (PWM). The generator communication (GENCOM) line communicates the desired setpoint from the PCM to the voltage regulator. The generator monitor (GENMON) line communicates the generator load and error conditions to the PCM. The third pin on the voltage regulator, the A circuit pin, is a dedicated battery voltage sense line.

The generator charges the battery and at the same time supplies power for all of the electrical loads that are required. The battery is more effectively charged with a higher voltage when the battery is cold and a lower voltage when the battery is warm. The PCM is able to adjust the charging voltage according to the battery temperature by using a signal from the intake air temperature (IAT) sensor. This means the voltage setpoint is calculated by the PCM and communicated to the regulator by the GENCOM circuit.

The PCM simultaneously controls and monitors the output of the generator. When the current consumption is high or the battery is discharged the PCM raises engine speed to increase generator output.

To minimize the engine drag when starting the engine, the PCM does not allow the generator to produce any output until the engine has started. The PCM turns off the generator during cranking to reduce the starter load and improve cranking speed. Once the engine starts, the PCM slowly increases generator output to help establish a stable engine speed.

The PCM controls the charging system warning indicator by sending a message over the high speed CAN to the instrument cluster (IC). The PCM turns the charging system warning indicator off when generator output begins. The charging system warning indicator is also illuminated by the PCM whenever the key is ON with

the engine OFF.

This is a System 4 charging system, which uses the GENMON and GENCOM lines to control and monitor the charging system through the PCM. System 4 charging systems are virtually identical in design and therefore, share the same diagnostics. The circuit numbers and colors may be different, but the functions are the same.

Inspection and Verification

WARNING: Batteries contain sulfuric acid and produce explosive gases. Work in a well-ventilated area. Do not allow the battery to come in contact with flames, sparks or burning substances. Avoid contact with skin, eyes or clothing. Shield eyes when working near the battery to protect against possible splashing of acid solution. In case of acid contact with skin or eyes, flush immediately with water for a minimum of 15 minutes, then get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in serious personal injury.

WARNING: Always lift a plastic-cased battery with a battery carrier or with hands on opposite corners. Excessive pressure on the battery end walls may cause acid to flow through the vent caps, resulting in personal injury and/or damage to the vehicle or battery.

CAUTION: Do not make jumper connections except as directed. Incorrect connections may damage the voltage regulator test terminals, fuses or fusible links.

CAUTION: Do not allow any metal object to come in contact with the generator housing and internal diode cooling fins. A short circuit may result and burn out the diodes.

NOTE: While carrying out any pinpoint test, disregard any DTCs set while following a specific pinpoint test. After the completion of a test, be sure to clear all DTCs in the PCM.

NOTE: All voltage measurements are referenced to the negative (-) battery post unless otherwise specified.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Battery • Generator drive belt	• Circuitry • Fusible links • Cables

• Generator pulley	• Generator • PCM • Charging system warning indicator

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. Verify the battery condition. Refer to **BATTERY, MOUNTING AND CABLES** article.
5. Check the operation of the charging system warning indicator at the instrument cluster (IC). Normal operation is as follows:
   - With the key OFF, the charging system warning indicator should be off.
   - With the key ON and the engine OFF, the charging system warning indicator should be on.
   - With the engine running, the charging system warning indicator should be off.
6. Turn off the headlamps and the A/C system (if equipped). Turn the climate control blower to low/off. Check the battery voltage before and after starting the engine to determine if the battery voltage increases.

NOTE: Make sure to use the latest scan tool software release.

7. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

8. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
9. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
10. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
    - If the network test passes, retrieve and record continuous memory DTCs.
11. Clear the continuous DTCs and carry out the self-test diagnostics for the PCM and the IC.
12. If the DTCs retrieved are related to the concern, go to the DTC Chart. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
13. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

NOTE: DTC P0622 can be set by the loss of the communication lines between the

generator and the PCM. The charging system warning indicator then illuminates until the engine is operated at greater than 4,500 RPM (approximately wide open throttle [WOT]) for a minimum of 3 seconds. At this time, the generator self-excites. The charging system warning indicator remains illuminated, and the generator operates in a default mode (approximately 13.5 volts) until the engine is turned off.

DTC CHART

DTCs	Description	Source	Action
B1317	Battery Voltage High	Various Modules	Go to **Pinpoint Test B**.
B1318	Battery Voltage Low	Various Modules	Go to **Pinpoint Test F**.
B1676	Battery Voltage Out of Range	Various Modules	Go to **Pinpoint Test F**.
P0563	System Voltage High	PCM	Go to **Pinpoint Test B**.
P0620	Generator Control Circuit	PCM	Go to **Pinpoint Test B**.
P0625	Generator Field Terminal Circuit - Low	PCM	Go to **Pinpoint Test B**.
P0626	Generator Field Terminal Circuit - High	PCM	Go to **Pinpoint Test B**.
P065B	Generator Control Circuit Range /Performance	PCM	Go to **Pinpoint Test B**.
All other DTCs	-	-	REFER to **MULTIFUNCTION ELECTRONIC MODULES** article.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The battery is discharged or battery voltage is low	• High key-off current drain(s) • Engine, generator and battery grounds • Positive battery cable • Circuitry • Battery • Generator	• Go to **Pinpoint Test A**.
• The charging system warning indicator is on with the engine running and no charging system DTCs present	• Circuitry • PCM • Generator • Instrument cluster (IC)	• Go to **Pinpoint Test C**.
• The generator is noisy	• Accessory drive belt • Loose bolts/brackets • Generator/pulley	• Go to **Pinpoint Test D**.
	• Generator	• Go to **Pinpoint Test**

• Radio interference	• Circuitry • In-vehicle entertainment system	**E**.

Pinpoint Tests

CAUTION: Electronic modules are sensitive to electrostatic discharge. If exposed to these charges, damage can result.

Refer to Inspection and Verification, the DTC Chart and the Symptom Chart for direction to the appropriate pinpoint test.

Pinpoint Test A: The Battery is Discharged or Battery Voltage is Low

Refer to **SYSTEM WIRING DIAGRAMS** (Expedition), **SYSTEM WIRING DIAGRAMS** (Expedition EL), **SYSTEM WIRING DIAGRAMS** (Navigator) or **SYSTEM WIRING DIAGRAMS** (Navigator L) for schematic and connector information.

Normal Operation

The generator output voltage is supplied through the positive battery output (B+), circuit SDC02 (RD) terminal on the rear of the generator to the battery and electrical system. During normal operation the charging system warning indicator is off with the key in the ON position and the engine running. The charging system warning indicator is on with the key in the ON position and the engine off.

This pinpoint test is intended to diagnose the following:

- High key-off current drain(s)
- Engine, generator and battery grounds
- Positive battery cable
- Circuit high resistance
- Battery
- Generator

PINPOINT TEST A: THE BATTERY IS DISCHARGED OR BATTERY VOLTAGE IS LOW

A1 CHECK THE BATTERY CONDITION

- Carry out the Battery - Condition Test to determine if the battery can hold a charge and is OK for use. Refer to **BATTERY, MOUNTING AND CABLES** article.
- **Does the battery pass the condition test?**

  YES : Go to A2.

  NO : INSTALL a new battery. REFER to **BATTERY, MOUNTING AND CABLES** article. TEST the system for normal operation.

A2 CHECK THE GENERATOR OUTPUT

- Carry out the Generator On-Vehicle Load Test and No Load Test. Refer to the Component Tests.
- **Does the generator pass the component tests?**

  YES : Go to A3.

NO : Go to **Pinpoint Test B**.

A3 CHECK FOR CURRENT DRAINS

- Carry out the Battery - Drain Testing. Refer to the Component Tests.
- **Are any circuits causing excessive current drains?**

  YES : REPAIR as necessary. TEST the system for normal operation.

  NO : Go to A4.

A4 CHECK THE VEHICLE GROUNDS

- Key in START position.

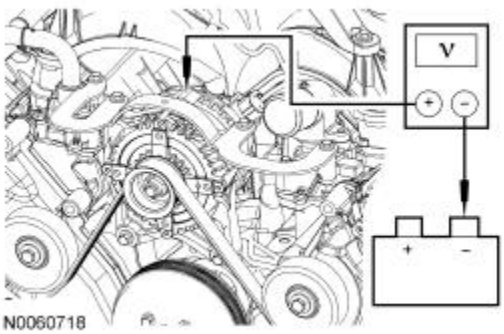

Fig. 1: Checking Voltage Drop
Courtesy of FORD MOTOR CO.

- With the engine running, measure the voltage drop between the generator housing and the negative battery terminal.
- **Is the voltage drop less than 0.1 volt?**

  YES : Go to A5.

  NO : CHECK the engine ground, generator ground and the battery ground for corrosion. TEST the system for normal operation.

A5 CHECK THE VOLTAGE DROP IN THE B+ CIRCUIT SDC02 (RD)

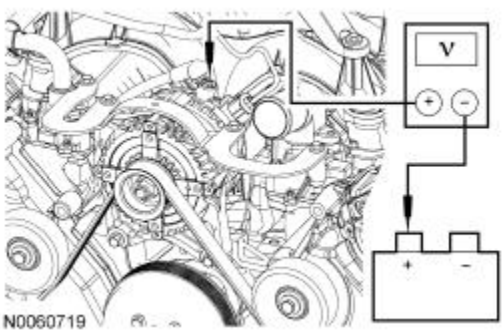

Fig. 2: Checking Voltage Drop
Courtesy of FORD MOTOR CO.

- With the engine running, measure the voltage drop between generator B+ C102b circuit SDC02 (RD) and the positive battery terminal.
- **Is the voltage drop less than 0.5 volt?**

  YES : CHECK if the customer left any electrical system(s) on or if there is an intermittent excessive battery draw. TEST the system for normal operation.

NO : CHECK for any corrosion in the B+ SDC02 (RD), positive battery cable and/or connections. REPAIR as necessary. TEST the system for normal operation.

Pinpoint Test B: The Charging System Warning Indicator is On and Any Charging System DTC Stored

Refer to **SYSTEM WIRING DIAGRAMS** (Expedition), **SYSTEM WIRING DIAGRAMS** (Expedition EL), **SYSTEM WIRING DIAGRAMS** (Navigator) or **SYSTEM WIRING DIAGRAMS** (Navigator L) for schematic and connector information.

Normal Operation

With the engine running, the charging system warning indicator is off. The sense A circuit SDC02 (RD) to the generator field coil is 13-15 volts. This voltage feedback is used by the regulator to maintain the battery voltage at the desired setpoint. The S (stator) circuit (internal to the generator) is used to monitor generator operation. This circuit and other regulator internal conditions are checked by the regulator to allow the PCM to turn off the charging system warning indicator by sending a message over the controller area network (CAN) bus to the instrument cluster (IC). The positive battery output (B+) circuit SDC02 (RD) is the generator output voltage supplied to the battery and electrical system.

This pinpoint test is intended to diagnose the following:

- Generator
- IC
- PCM

PINPOINT TEST B: THE CHARGING SYSTEM WARNING INDICATOR IS ON AND ANY CHARGING SYSTEM DTC STORED

NOTE: Make sure battery voltage is greater than 12.2 volts prior to carrying out this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

B1 CONFIRM THE BATTERY CONDITION

- Carry out the Battery Condition Test. Refer to **BATTERY, MOUNTING AND CABLES** article.
- **Is the battery OK?**

  YES : Go to B2.

  NO : CORRECT the battery condition and Go to B2.

B2 CHECK THE FUSIBLE LINKS

- Check the fusible links.
- **Are the fusible links OK?**

  YES : Go to B3.

  NO : REPAIR circuit SDC02 (RD) and INSTALL a fusible link. INSPECT PCM and engine ground circuits and make sure they are securely attached. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B3 CHECK THE GENERATOR B+ CONNECTION

- Key in OFF position

- Inspect generator C102b circuit SDC02 (RD) connection. Connection should be tight.

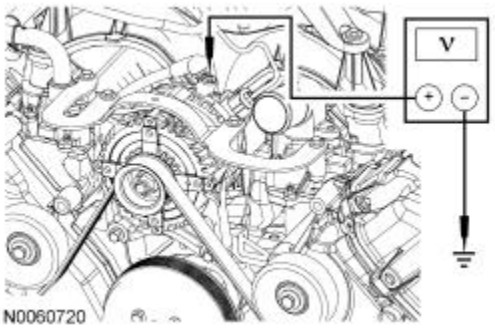

Fig. 3: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between generator C102b circuit SDC02 (RD) and ground.
- **Is generator C102b connection tight and does the generator B+ measure battery voltage?**

  YES : Go to B4.

  NO : TIGHTEN the generator B+ connection or REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B4 MONITOR THE PCM PID GENERATOR MONITOR WITH KEY ON/ENGINE OFF (KOEO)

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Clear the PCM DTCs
- Enter the following diagnostic mode on the diagnostic tool: Select PCM PIDs

NOTE: Many of the PCM PIDs selected will be monitored later in this pinpoint test.

Select and monitor the following PCM PIDs:

- Generator Monitor (GENMON).
- Generator Command Duty Cycle (GENCMD).
- Generator Voltage Desired (GENVDSD).
- Generator Fault Indicator Lamp (GENFIL).
- Engine Revolutions Per Minute (RPM).
- Module Supply Voltage (VPWR).

- Monitor the GENMON PID.
- **Does the GENMON PID read 0%?**

  YES : Go to B5.

  NO : Go to B8.

B5 MONITOR THE PCM PID GENERATOR MONITOR WITH KEY ON/ENGINE RUNNING (KOER)

- Key in START position.
- With the engine at idle, wait 15 seconds for the GENVDSD PID to increase to greater than 13 volts.

- Monitor PID GENMON at idle and 3,000 RPM.
- **Does the GENMON PID read between 3% and 98% at engine idle speed and at 3,000 RPM?**

  YES : Go to B6.

  NO : Go to B8.

B6 MONITOR THE PCM PIDs GENERATOR MONITOR, MODULE SUPPLY VOLTAGE AND GENERATOR DESIRED VOLTAGE WITH THE ENGINE AT 3,000 RPM

- Turn all electrical accessories (lights, blower motor, etc.) off.

NOTE: If GENMON PID does not remain below 85%, make sure that the battery is at an acceptable state of charge and that all electrical accessories are off.

- Increase the engine speed to 3,000 RPM (or road test).
- **Does the VPWR PID remain within ± 0.5 volt of the GENVDSD PID when the GENMON PID is less than 85%?**

  YES : Go to B7.

  NO : Go to B17.

B7 MONITOR THE PCM PIDs GENERATOR MONITOR, MODULE SUPPLY VOLTAGE AND GENERATOR DESIRED VOLTAGE WITH THE ENGINE AT IDLE

- Return the engine speed to idle.

CAUTION: On vehicles with low electrical loads, it may be necessary to add external loads (devices connected to power points, etc.) to determine the maximum GENMON value. GENMON value will not read between 95%-98% on a vehicle with minimal electrical accessories. As long as there is a significant increase in the GENMON PID following the procedure below, answer YES to the question.

- Determine the maximum GENMON PID value by lowering engine idle RPM to 500 RPM or less using output state control (manual transaxle vehicles require the parking brake applied and the clutch pedal depressed) and turn on all electrical accessories until the VPWR PID is less than the GENVDSD PID by at least 0.7 volt. Under this condition the GENMON PID should read between 95% and 98%.
- **Does the GENMON PID read between 95% and 98%?**

  YES : Go to B19.

  NO : Go to B17.

B8 CHECK THE VOLTAGE OUTPUTS FROM THE PCM

- Key in OFF position.
- Disconnect: Generator C102a
- Key in ON position.
- Measure the voltage of the following circuits:

EXPECTED VOLTAGES

Generator Connector	Circuit	Expected Voltage (Approximate)
C102a-1	CDC15 (VT)	8-11 volts (should be less than battery voltage)
C102a-2	CDC10 (BU/OG)	0 volts
C102a-3	SDC02 (RD)	Battery voltage

- **Are the voltages as indicated for each circuit?**

  YES : Go to B13.

  NO : If a fault is detected in the GENCOM circuit CDC10 (BU/OG) or GENMON circuit CDC15 (VT), go to B9.

  If a fault is detected in the A sense SDC02 (RD) circuit, go to B12.

B9 CHECK CIRCUITS CDC10 (BU/OG) AND CDC15 (VT) FOR DAMAGE OR AN OPEN

- Key in OFF position.
- Disconnect: Generator C102a
- Disconnect: PCM C175b
- Inspect the following for damaged or pushed-out pins:

Component	Connector	Circuit
PCM	C175b-22	CDC10 (BU/OG)
PCM	C175b-23	CDC15 (VT)
Generator	C102a-2	CDC10 (BU/OG)
Generator	C102a-1	CDC15 (VT)

- Measure the resistance between circuit C175b-22 and C102a-2 and circuit C175b-23 and C102a-1.
- **Are the connectors and pins free of damage and are the resistances less than 5 ohms?**

  YES : Go to B10.

  NO : REPAIR the affected circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B10 CHECK CIRCUITS CDC10 (BU/OG) AND CDC15 (VT) FOR SHORT TO VOLTAGE

- Key in ON position.
- Measure the voltage between circuits C102a-1, CDC15 (VT) and C102a-2, CDC10 (BU/OG).
- **Are the voltages approximately 0 volt?**

  YES : Go to B11.

NO : REPAIR the affected circuits. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B11 CHECK CIRCUITS CDC10 (BU/OG) AND CDC15 (VT) FOR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between circuit C102a-1, CDC15 (VT) harness side and ground and C102a-2, CDC10 (BU/OG) harness side and ground and also measure resistance. between each other:
- **Are the resistances less than 5 ohms?**

  YES : Go to B24.

  NO : REPAIR the affected circuits. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B12 CHECK CIRCUIT SDC02 (RD) FOR DAMAGE OR AN OPEN

- Key in OFF position.
- Disconnect: Generator C102a
- Inspect C102a-3 for damaged or pushed-out pins.
- Measure the resistance of the circuit A sense circuit SDC02 (RD) between the battery and C102a-3 generator connector.
- **Are the connectors and pins free of damage and are the resistances less than 5 ohms?**

  YES : Go to B24.

  NO : REPAIR the affected circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B13 CHECK FOR SHORTED CIRCUITS

- Key in OFF position.
- Disconnect: Generator C102a
- Verify that PID GENMON reads 100%.
- Carry out the wiggle test of wiring to determine if PID GENMON changes from 100%.
- **Does PID GENMON change from 100%?**

  YES : REPAIR short circuit on CDC15 (VT) C102a-1.

  NO : Go to B14.

B14 CHECK THE PCM PID GENERATOR MONITOR INPUT TO THE PCM

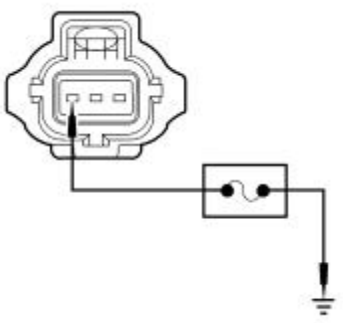

Fig. 4: Connecting Fused Jumper Wire
Courtesy of FORD MOTOR CO.

- Connect a fused (10A) jumper wire between generator C102a-1, circuit CDC15 (VT), harness

side and ground.

- Key in ON position.
- Monitor the GENMON PID while performing a wiggle test on the wire harness.
- **Does the GENMON PID read 0%?**

  YES : Go to B15.

  NO : REPAIR open connection on circuit CDC15 (VT). INSPECT generator C102a-1 and PCM C175e-16 for damage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B15 COMPARE THE PCM PIDs GENERATOR MONITOR AND GENERATOR FIELD DUTY CYCLE

- Key in OFF position.
- Disconnect: Fused (10A) Jumper Wire

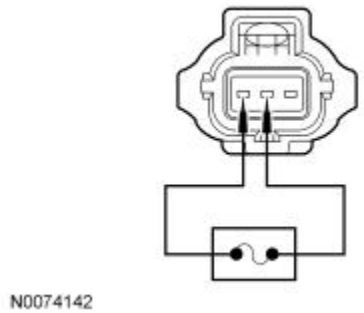

Fig. 5: Connecting Fused Jumper Wire
Courtesy of FORD MOTOR CO.

- Connect a fused (10A) jumper wire between generator C102a-1, circuit CDC15 (VT), harness side and generator C102a-2, circuit CDC10 (BU/OG), harness side.
- Key in ON position.
- Monitor the GENMON and GENCMD PIDs while performing a wiggle test on the harness.
- **Does the GENMON PID read within 2% of the GENCMD PID?**

  YES : Go to B16.

  NO : INSPECT C175b-66, circuit GD113 (BK/YE), PCM ground circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B16 A SENSE CIRCUIT LOAD TEST

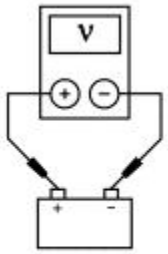
NOTE: This step puts a load on the A sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault.

- Key in ON position.
- Using a 12-volt test lamp, check for voltage at C102a-3, circuit SDC02 (RD).
- **Does the test lamp illuminate?**

  YES : Go to B23.

  NO : REPAIR connection on circuit SDC02 (RD). INSPECT generator C102a-3 for damage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B17 CHECK THE PCM VPWR PID



AJ0210-A

Fig. 6: Checking The Battery Voltage
Courtesy of FORD MOTOR CO.

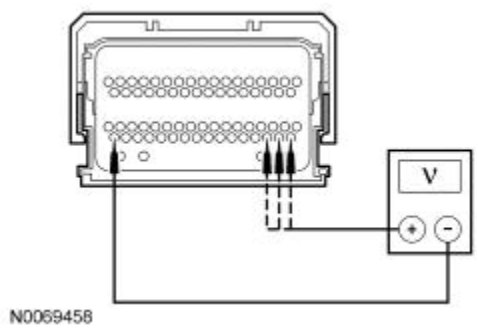
- With the engine running, measure the battery voltage.
- Monitor the VPWR PID.
- **Are the battery voltage and VPWR PID within 0.5 volt of each other?**

  YES : Go to B19.

  NO : Go to B18.

B18 MEASURE THE PCM INPUT VOLTAGE

- Key in OFF position.
- Disconnect: PCM C175b
- Connect a fused (10A) jumper wire between C175b-8 circuit CE607 (BN/YE) and ground.
- Key in ON position.



N0069458

Fig. 7: Checking Circuits For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between PCM input voltage pins 51, 52 and 53 to PCM ground pin 66.
- **Are voltages within 0.5 volt of PID VPWR?**

  YES : Go to B24.

  NO : REPAIR high resistance or loose connections between C175b-51 circuit CBB76 (BU/BN), C175b-52 circuit CBB76 (BU/BN), C175b-53 circuit CBB76 (BU/BN) PCM power circuits or C175b-66, circuit GD113 (BK/YE), PCM ground circuit.

B19 CHECK THE GENERATOR B+ RESISTANCE

- Key in OFF position.
- Disconnect: Battery
- Disconnect: Generator C102b

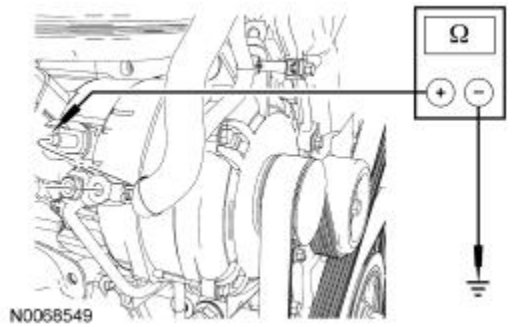


Fig. 8: Checking Circuit For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between generator C102b, component side and the generator housing.
- **Is the resistance greater than 125K ohms?**

  YES : Go to B20.

  NO : INSTALL a new generator. REFER to **GENERATOR AND REGULATOR** article. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B20 CHECK THE RESISTANCE OF THE VOLTAGE REGULATOR INTERNAL CIRCUITS TO GROUND

- Measure the resistance between generator C102a, component side and ground. Refer to the following table.

Pin	Expected Resistance
1	Greater than 1,000K ohms
2	Greater than 125K ohms
3	Greater than 125K ohms

- **Are the resistance values as indicated?**

  YES : Go to B21.

  NO : INSTALL a new generator. REFER to **GENERATOR AND REGULATOR** article. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B21 ROAD TEST IN AN ATTEMPT TO VERIFY THE FAULT

- Connect: Generator C102b
- Connect: Generator C102a
- Connect: Battery
- Carry out a road test and monitor the following PIDs:
  - Generator monitor (GENMON).
  - Generator voltage desired (GENVDSD).

  - Module supply voltage (VPWR).
- **Does the GENMON PID read either 0% or 100% during the road test?**

  YES : Go to B2.

  NO : If a road test did not cause the fault to occur, intermittent fault condition may be present. Go to B22.

B22 USE THE VEHICLE DATA RECORDER (VDR) TO CAPTURE INTERMITTENT FAULT CONDITION

- Connect a VDR to the vehicle and setup to capture the following PIDs:
  - Generator monitor (GENMON).
  - Generator command duty cycle (GENCMD).
  - Generator voltage desired (GENVDSD).
  - Generator fault indicator lamp (GENFIL).
  - Engine revolutions per minute (RPM).
  - Module supply voltage (VPWR).
- Set the VDR to trigger if any of the following events occur during vehicle operation (waiting 15 seconds after start):
  - VPWR PID reads greater than 15.2 volts.
  - GENMON PID reads 0% or 100%.
- Road test the vehicle.
- **Was a fault captured by the VDR?**

  YES : RECORD any values from the VDR that may have been captured. If no charging system DTCs are present, go to **Pinpoint Test C**. If any charging system DTCs are present, go to B3.

  NO : No problem found at this time. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B23 CHECK THE CHARGING SYSTEM CIRCUITS FOR INTERMITTENT FAULTS

- Key in OFF position.
- Connect: Generator C102b
- Connect: Generator C102a
- Connect: PCM C175b
- Connect the diagnostic tool.
- Key in START position.
- With the engine running, monitor the charging system warning indicator lamp and the scan tool for DTCs.
- **Does the charging system warning indicator lamp illuminate and does any charging system DTC get stored into memory?**

  YES : INSTALL a new generator. REFER to **GENERATOR AND REGULATOR** article. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : The fault is not present and cannot be recreated at this time. This may indicate an intermittent fault. Go to B19.

B24 CHECK THE CHARGING SYSTEM CIRCUITS FOR INTERMITTENT FAULTS

- Key in OFF position.
- Connect: Generator C102b

- Connect: Generator C102a
- Connect: PCM C175b
- Connect the diagnostic tool.
- Key in START position.
- With the engine running, monitor the charging system warning indicator lamp and the scan tool for DTCs.
- **Does the charging system warning indicator lamp illuminate and does any charging system DTC get stored into memory?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article.

  NO : The fault is not present and cannot be recreated at this time. This may indicate an intermittent fault. Go to B19.

Pinpoint Test C: The Charging System Warning Indicator is On With the Engine Running and No Charging System DTCs Present

Refer to **SYSTEM WIRING DIAGRAMS** (Expedition), **SYSTEM WIRING DIAGRAMS** (Expedition EL), **SYSTEM WIRING DIAGRAMS** (Navigator) or **SYSTEM WIRING DIAGRAMS** (Navigator L) for schematic and connector information.

Normal Operation

With the engine running, the charging system warning indicator is off. The A circuit SDC02 (RD) from the battery B+ to the generator regulator is 13-15 volts. This voltage feedback is used by the regulator to maintain the battery voltage at the desired setpoint. The S (stator) circuit (internal to the generator) is used to monitor generator operation. This circuit and other regulator internal conditions are checked by the regulator to allow the PCM to turn off the charging system warning indicator by sending a message over the controller area network (CAN) bus to the instrument cluster (IC). The positive battery output (B+) circuit SDC02 (RD) is the generator output supplied to the battery and electrical system.

This pinpoint test is intended to diagnose the following:

- Generator
- Circuitry
- IC
- PCM

PINPOINT TEST C: THE CHARGING SYSTEM WARNING INDICATOR IS ON WITH THE ENGINE RUNNING AND NO CHARGING SYSTEM DTCs PRESENT

NOTE: Make sure battery voltage is greater than 12.2 volts prior to carrying out this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

C1 CHECK THE BATTERY CONDITION

- Carry out the Battery - Condition Test to determine if the battery can hold a charge and is OK for use. Refer to **BATTERY, MOUNTING AND CABLES** article.
- **Does the battery pass the condition test?**

YES : Go to C2.

NO : INSTALL a new battery. REFER to **BATTERY, MOUNTING AND CABLES** article. TEST the system for normal operation.

C2 CHECK THE GENERATOR B+ CONNECTION

- Key in OFF position.
- Inspect generator C102b circuit SDC02 (RD) connection. Connection should be tight.

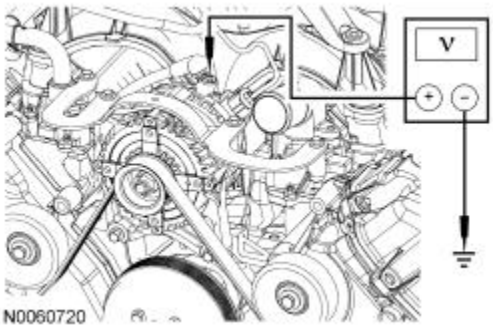

Fig. 9: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between generator C102b circuit SDC02 (RD) and ground.
- **Is generator C102b connection tight and does the generator B+ measure battery voltage?**

YES : Go to C3.

NO : TIGHTEN the generator B+ connection or REPAIR the circuit. CLEAR the any DTCs. REPEAT the self-test. TEST the system for normal operation.

C3 CHECK THE VOLTAGE DROP IN THE B+ CIRCUIT SDC02 (RD)

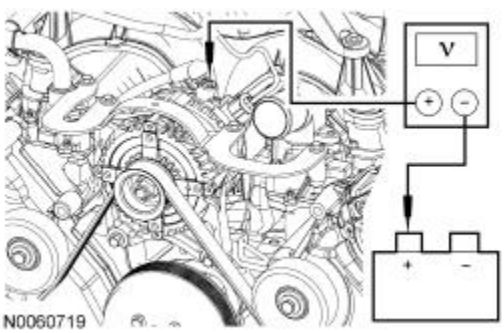

Fig. 10: Checking Voltage Drop
Courtesy of FORD MOTOR CO.

- With the engine running, measure the voltage drop between generator B+ C102b circuit SDC02 (RD) and the positive battery terminal.
- **Is the voltage drop less than 0.5 volt?**

YES : Go to C4.

NO : CHECK for any corrosion in the B+ C102b circuit SDC02 (RD), positive battery cable and/or connections. REPAIR as necessary. TEST the system for normal operation.

C4 CHECK THE DTCs IN THE PCM

- Key in OFF position.

- Connect the diagnostic tool.
- Key in START position.
- Enter the following diagnostic mode on the diagnostic tool: Retrieve PCM DTCs
- Use the recorded PCM DTCs from the continuous and on-demand self tests.
- **Are any PCM DTCs recorded?**

  YES : For all DTCs EXCEPT charging system DTCs, REFER to the **Introduction - Gasoline Engines** article. If any charging system DTCs are present, go to **Pinpoint Test B**. If referred here by the PC/ED, go to C5.

  NO : Go to C5.

C5 MONITOR PID GENFIL

- With the engine running, monitor PID GENFIL.
- **Does PID GENFIL show fault?**

  YES : Go to C6.

  NO : REPAIR/INSTALL a new IC, IC-to-PCM connection or the PCM. TEST the system for normal operation.

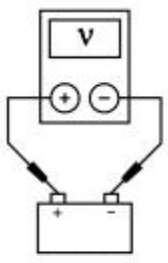
C6 MONITOR PID VPWR

- With the engine running, monitor PIDS VPWR, GENFIL, GENVDSD.
- **Is PID VPWR greater than 15.6 volts?**

  YES : Go to C7.

  NO : Go to C8.

C7 CHECK PCM VPWR PID



AJ0210-A

Fig. 11: Checking The Battery Voltage
Courtesy of FORD MOTOR CO.

- With the engine running, measure the battery voltage.
- Monitor the VPWR PID.
- **Are the battery voltage and VPWR PID within 0.6 volt of each other?**

  YES : Go to C8.

  NO : Go to C9.

C8 MEASURE THE PCM INPUT VOLTAGE

- Key in OFF position.
- Disconnect: PCM C175b
- Connect a fused (10A) jumper wire between C175b-8 circuit CE607 (BN/YE) and ground.

- Key in ON position.

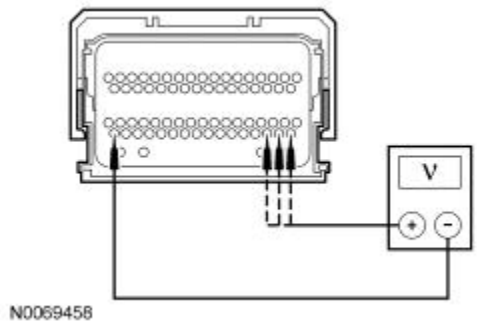


Fig. 12: Checking Circuits For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between PCM input voltage pins 51, 52 and 53 to PCM ground pin 66.
- **Are voltages within 0.5 volt of PID VPWR?**

  YES : INSTALL a new PCM.

  NO : REPAIR high resistance or loose connections between C175b-51 circuit CBB76 (BU/BN), C175b-52 circuit CBB76 (BU/BN), C175b-53 circuit CBB76 (BU/BN) PCM power circuits or C175b-66, circuit GD113 (BK/YE), PCM ground circuit.

C9 MONITOR THE PCM PID GENERATOR MONITOR WITH KEY ON/ENGINE RUNNING

- Key in START position.
- With the engine at idle, wait 15 seconds for the GENVDSD PID to increase to greater than 13 volts.
- Monitor PID GENMON at idle and 3,000 RPM.
- **Does the GENMON PID read between 3% and 98% at engine idle speed and at 3,000 RPM?**

  YES : Go to C10.

  NO : Go to C11.

C10 MONITOR PID GENVDSD

- With the engine running, monitor PID GENVDSD.
- **Is PID GENVDSD greater than 15.2 volts?**

  YES : REPAIR connection on circuit SDC02 (RD). INSPECT generator C102a-3 for damage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If no problems are found, INSTALL a new generator. REFER to **GENERATOR AND REGULATOR** article. TEST the system for normal operation.

  NO : INSTALL a new PCM.

C11 CHECK FOR SHORTED CIRCUITS

- Key in OFF position.
- Disconnect: Generator C102a
- Verify that PID GENMON reads 100%.
- Carry out the wiggle test of wiring to determine if PID GENMON changes from 100%.
- **Does PID GENMON change from 100%?**

YES : REPAIR short circuit on C102a-1 CDC15 (VT).

NO : Go to C12.

C12 CHECK THE PCM PID GENERATOR MONITOR INPUT TO THE PCM

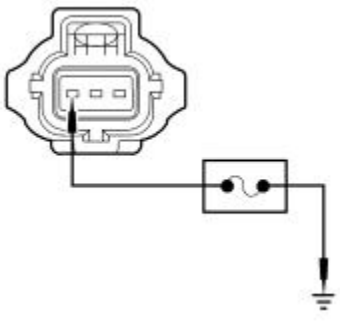

Fig. 13: Connecting Fused Jumper Wire
Courtesy of FORD MOTOR CO.

- Connect a fused (10A) jumper wire between generator C102a-1, circuit CDC15 (VT), harness side and ground.
- Key in ON position.
- Monitor the GENMON PID while carrying out a wiggle test on the wire harness.
- **Does the GENMON PID read 0%?**

  YES : REPAIR open connection on circuit CDC15 (VT) C102a-1, and PCM C175b-23. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : INSTALL a new generator. REFER to **GENERATOR AND REGULATOR** article. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test D: The Generator is Noisy

Refer to **SYSTEM WIRING DIAGRAMS** (Expedition), **SYSTEM WIRING DIAGRAMS** (Expedition EL), **SYSTEM WIRING DIAGRAMS** (Navigator) or **SYSTEM WIRING DIAGRAMS** (Navigator L) for schematic and connector information.

Normal Operation

The generator is belt-driven by the engine accessory drive system.

This pinpoint test is intended to diagnose the following:

- Accessory drive belt
- Loose bolts/brackets
- Generator/pulley

PINPOINT TEST D: THE GENERATOR IS NOISY

D1 CHECK FOR ACCESSORY DRIVE BELT NOISE AND LOOSE MOUNTING BRACKETS

- Key in OFF position.
- Check the accessory drive belt for damage and correct installation. Refer to **ACCESSORY**

DRIVE article.

- Check the accessory mounting brackets and generator pulley for looseness or misalignment.
- **Is the accessory drive OK?**

  YES : Go to D2.

  NO : REPAIR as necessary. REFER to **ACCESSORY DRIVE** article for diagnosis and testing of the accessory drive system. TEST the system for normal operation.

D2 CHECK THE GENERATOR MOUNTING

- Check the generator mounting for loose bolts or misalignment.
- **Is the generator mounted correctly?**

  YES : Go to D3.

  NO : REPAIR as necessary. TEST the system for normal operation.

D3 CHECK THE GENERATOR FOR ELECTRICAL NOISE

- Disconnect: Generator C102b
- Key in START position.
- With the engine running, use a stethoscope or equivalent listening device to probe the generator.
- **Is the noise still present?**

  YES : Go to D4.

  NO : INSTALL a new generator. REFER to **GENERATOR AND REGULATOR** article. TEST the system for normal operation.

D4 CHECK THE GENERATOR FOR MECHANICAL NOISE

- With the engine running, use a stethoscope or equivalent listening device to probe the generator and the accessory drive area for unusual mechanical noise.
- **Is the generator the noise source?**

  YES : INSTALL a new generator. REFER to **GENERATOR AND REGULATOR** article. TEST the system for normal operation.

  NO : REFER to **ENGINE SYSTEM - GENERAL INFORMATION** article to diagnose the source of the engine noise.

Pinpoint Test E: Radio Interference

Refer to **SYSTEM WIRING DIAGRAMS** (Expedition), **SYSTEM WIRING DIAGRAMS** (Expedition EL), **SYSTEM WIRING DIAGRAMS** (Navigator) or **SYSTEM WIRING DIAGRAMS** (Navigator L) for schematic and connector information.

Normal Operation

The generator radio suppression equipment reduces interference transmitted through the speakers by the vehicle electrical system.

This pinpoint test is intended to diagnose the following:

- Generator
- Circuitry
- In-vehicle entertainment system

PINPOINT TEST E: RADIO INTERFERENCE

E1 VERIFY THE GENERATOR IS THE SOURCE OF THE RADIO INTERFERENCE

NOTE: If the OEM audio unit has been replaced with an aftermarket unit, the vehicle may not pass this test. Return the vehicle to OEM condition before following this pinpoint test.

- Key in START position.
- Start and run the engine.
- Tune the audio unit to a station where the interference is present.
- Key in OFF position.
- Disconnect: Generator C102b
- Key in START position.
- With the engine running, determine if the interference is still present.
- **Is the interference present with the generator disconnected?**

  YES : REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article for diagnosis and testing of the in-vehicle entertainment system.

  NO : INSTALL a new generator. REFER to **GENERATOR AND REGULATOR** article. TEST the system for normal operation.

Pinpoint Test F: DTC B1318 or B1676 - Battery Voltage Low or Battery Voltage Out of Range

Refer to **SYSTEM WIRING DIAGRAMS** (Expedition), **SYSTEM WIRING DIAGRAMS** (Expedition EL), **SYSTEM WIRING DIAGRAMS** (Navigator) or **SYSTEM WIRING DIAGRAMS** (Navigator L) for schematic and connector information.

Normal Operation

Various control modules within the vehicle operate at a voltage between 10-17 volts. Voltage to these modules is supplied through the vehicle harness to the module(s). Ground for the modules is provided by the modules ground circuit(s). If voltages to these modules rise above 17 volts, DTC B1317 or B1676 may set or if voltage drops below 10 volts, DTC B1318 or B1676 may set.

This pinpoint test is intended to diagnose the following:

- Battery
- Charging system
- Module voltage supply
- Module ground

NOTE: DTC B1317 or B1318 can be set if the vehicle has had a discharged battery, has had been recently jump started or has had the vehicle battery charged.

PINPOINT TEST F: DTC B1318 OR B1676 - BATTERY VOLTAGE LOW OR BATTERY VOLTAGE OUT OF RANGE

F1 CHECK FOR DTCs

- Key in OFF position.
- Connect the diagnostic tool.

- Enter the following diagnostic mode on the diagnostic tool: Retrieve all continuous DTCs
- **Is DTC B1318 or B1676 present in only one module?**

  YES : If DTC B1317 or B1676 are recorded in only ONE module, go to F2.

  NO : If DTC B1318 or B1676 are recorded in more than one module, go to **Pinpoint Test B**.

F2 CHECK THE BATTERY VOLTAGE

- Measure the battery voltage between the positive and negative battery posts with the key ON engine OFF (KOEO), and with the engine running, all accessory loads OFF.
- **Is the battery voltage between 10 and 13 volts with KOEO, and between 11 and 17 volts with the engine running?**

  YES : Go to F3.

  NO : CHECK and/or REPAIR the charging system as necessary. Go to **Pinpoint Test B**. TEST the system for normal operation. CLEAR the DTCs. REPEAT the self-test.

F3 CHECK THE VOLTAGE TO THE MODULE

- Key in OFF position.
- Disconnect: Affected module which recorded the DTC B1317 or B1676
- Key in ON position.
- Measure all of the affected module's power circuits, harness side to ground. Refer to **SYSTEM WIRING DIAGRAMS** (Expedition), **SYSTEM WIRING DIAGRAMS** (Expedition EL), **SYSTEM WIRING DIAGRAMS** (Navigator) or **SYSTEM WIRING DIAGRAMS** (Navigator L) for schematic and connector information..
- **Is the voltage greater than 10 volts?**

  YES : Go to F4.

  NO : REPAIR the module power circuit(s). CLEAR the DTCs. REPEAT the self-test.

F4 CHECK THE MODULE GROUNDS

- Key in OFF position.
- Measure the resistance between all of the affected module's ground circuits, harness side to ground. Refer to **SYSTEM WIRING DIAGRAMS** (Expedition), **SYSTEM WIRING DIAGRAMS** (Expedition EL), **SYSTEM WIRING DIAGRAMS** (Navigator) or **SYSTEM WIRING DIAGRAMS** (Navigator L) for schematic and connector information..
- **Is the resistance less than 5 ohms?**

  YES : Go to F5.

  NO : REPAIR the module ground circuit(s). CLEAR the DTCs. REPEAT the self-test.

F5 CHECK THE MODULE FOR CORRECT OPERATION

- Key in OFF position.
- Disconnect: All of the affected module connectors
- Check the connector and module for:
  - corrosion.
  - pushed-out or damaged pins.
  - connector or module damage.
- Connect: All of the affected module connectors
- Clear all DTCs.
- Operate the system and verify the concern is still present.

- **Is the concern still present?**

  YES : INSTALL a new module. REFER to the removal and installation procedure in the affected module's section. CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been the result of a loose connection, may recently have had a discharged battery or may have been jump started. CLEAR the DTCs. REPEAT the self-test.

Component Tests

Battery - Drain Testing

WARNING: Do not attempt to service, charge, recharge or jump start a battery unless the following information has been read and understood. Failure to follow this instruction may result in serious personal injury.

CAUTION: To prevent damage to the meter, do not crank the engine or operate accessories that draw more than 10A.

CAUTION: If equipped with the CD6 audio unit, precautions must be taken when the battery has been disconnected. When reconnecting the battery, make sure no interruption of power occurs for 30 seconds. If power is interrupted during the first 30 seconds, permanent damage to the CD6 audio unit will result.

NOTE: No factory-equipped vehicle should have more than a 50 mA (0.050 amp) draw.

Check for current drains on the battery in excess of 50 mA (0.050 amp) with all the electrical accessories off and the vehicle at rest for at least 40 minutes. Current drains can be tested with the following procedure.

NOTE: Many electronic modules draw 10 mA (0.010 amp) or more continuously.

NOTE: Use an in-line ammeter between the negative battery post and its respective cable.

NOTE: Typically, a drain of approximately one amp is attributed to an engine compartment lamp, glove compartment lamp or interior lamp staying on continually. Other component failures or wiring shorts are located by selectively pulling fuses to pinpoint the location of the current drain. When the current drain is found, the meter reading falls to an acceptable level. If the drain is still not located after checking all the fuses, it is due to the generator.

NOTE: To accurately test the drain on a battery, an in-line ammeter must be used. Use of a test lamp or voltmeter is not an accurate method due to the number of electronic modules.

1. Make sure the junction box(es)/fuse panel(s) is accessible without turning on the interior lights or the underhood lights.
2. Drive the vehicle at least 5 minutes and over 48 km/h (30 mph) to turn on and activate the vehicle systems.
3. Allow the vehicle to sit with the key off for at least 40 minutes to allow the modules to time out/power down.
4. Connect a fused jumper wire (30A) between the negative battery cable and the negative battery post to prevent modules from resetting and to catch capacitive drains.
5. Disconnect the negative battery cable from the negative battery post without breaking the connection of the jumper wire.

NOTE: It is very important that continuity is not broken between the battery and the negative battery cable when connecting the meter. If this happens, the entire procedure must be repeated.

6. Connect the battery tester between the negative battery cable and the post. The meter must be capable of reading milliamps and should have a 10 amp capability.

NOTE: If the meter settings need to be switched or the test leads need to be moved to another jack, the jumper wire must be reinstalled to avoid breaking continuity.

NOTE: Amperage draw varies from vehicle to vehicle depending on the equipment package. Compare to a similar vehicle for reference.

NOTE: No factory-equipped vehicle should have more than a 50 mA (0.050 amp) draw.

7. Remove the jumper wire.
8. Note the amperage draw. Draw varies from vehicle to vehicle depending on the equipment package. Compare to a similar vehicle for reference.
9. If the draw is found to be excessive, remove the fuses from the smart junction box (SJB) one at a time and note the current reading. Do not reinstall the fuses until you have finished testing. To correctly isolate each of the circuits, all of the fuses may need to be removed and then install one fuse, note the amperage draw, remove the fuse and install the next fuse. Continue this process with each fuse.
10. If the current draw is still excessive, remove the fuses from the battery junction box (BJB) one at a time and note the current drop. Do not reinstall the fuses until you have finished testing. To correctly isolate each of the circuits, all of the fuses may need to be removed, then install one fuse, note the amperage draw, remove the fuse and install the next fuse. Continue this process with each fuse. When the current level drops to an acceptable level after removing a fuse, the circuit containing the excessive draw has been located.
11. Check the wiring diagrams for any circuits that run from the battery without passing through the BJB or the SJB. If the current draw is still excessive, disconnect these circuits until the draw is found. Also, disconnect the generator electrical connections if the draw cannot be located. The generator may be internally shorted, causing the current drain.

Generator On-Vehicle Tests

CAUTION: To prevent damage to the generator, do not make the jumper wire connections except as directed.

CAUTION: Do not allow any metal object to come in contact with the housing and the internal diode cooling fins with the key on or off. A short circuit may result and burn out the diodes.

NOTE: Battery posts and cable clamps must be clean and tight for accurate meter indications.

NOTE: Refer to the battery tester manual for complete directions for testing the charging system.

1. Turn off all lamps and electrical components.
2. Place the transmission in NEUTRAL and apply the parking brake.
3. Carry out the Load Test and No-Load Test according to the following component tests:

Generator On-Vehicle Tests - Load Test

1. Switch the tester to the ammeter function.
2. Connect the positive and negative leads of the tester to the corresponding battery terminals.
3. Connect the current probe to the generator B+ output terminal, circuit SDC02 (RD).
4. With the engine running at approximately 2,000 RPM, adjust the tester load bank to determine the output of the generator. Generator output should be greater than the graph shown below. If not, refer back to the pinpoint test or Go to **Symptom Chart**.

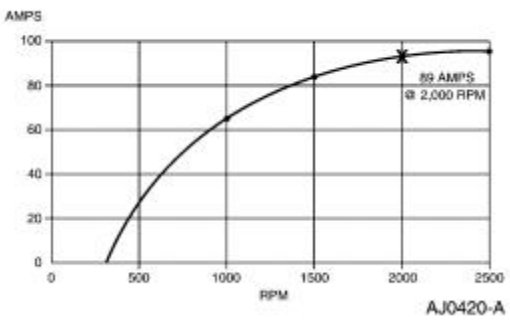

Fig. 14: Generator Output Chart
Courtesy of FORD MOTOR CO.

Generator On-Vehicle Tests - No-Load Test

1. Switch the tester to the voltmeter function.
2. Connect the voltmeter positive lead to the generator B+ terminal, circuit SDC02 (RD), and the negative lead to ground.
3. Turn all electrical accessories off.
4. With the engine running at approximately 2,000 RPM, check the generator output voltage. The voltage should be between 13.2 and 15.5 volts. If not, refer back to the pinpoint test or Go to **Symptom Chart**.

2007 ELECTRICAL

Generator and Regulator - Expedition, Expedition EL, Navigator & Navigator L

SPECIFICATIONS

GENERAL SPECIFICATIONS

GENERAL SPECIFICATIONS

Item	Specification
Generator	
Rating	89/157 amp (max) @ 1,800-6,000 generator rpm, approximately 500-2,000 engine rpm
Generator pulley ratio	2.96:1
Voltage regulator type	Electronic internal with generator

TORQUE SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-ft	lb-in
Generator B+ terminal nut	8	-	71
Generator bolts	25	18	-
Generator bracket bolts	10	-	89

DESCRIPTION AND OPERATION

GENERATOR

The generator is belt-driven by the engine accessory drive system. The generator has an internal voltage regulator that is not replaced separately. The generator and voltage regulator are repaired as an assembly.

DIAGNOSTIC TESTS

GENERATOR

Refer to **CHARGING SYSTEM - GENERAL INFORMATION** article.

REMOVAL AND INSTALLATION

GENERATOR

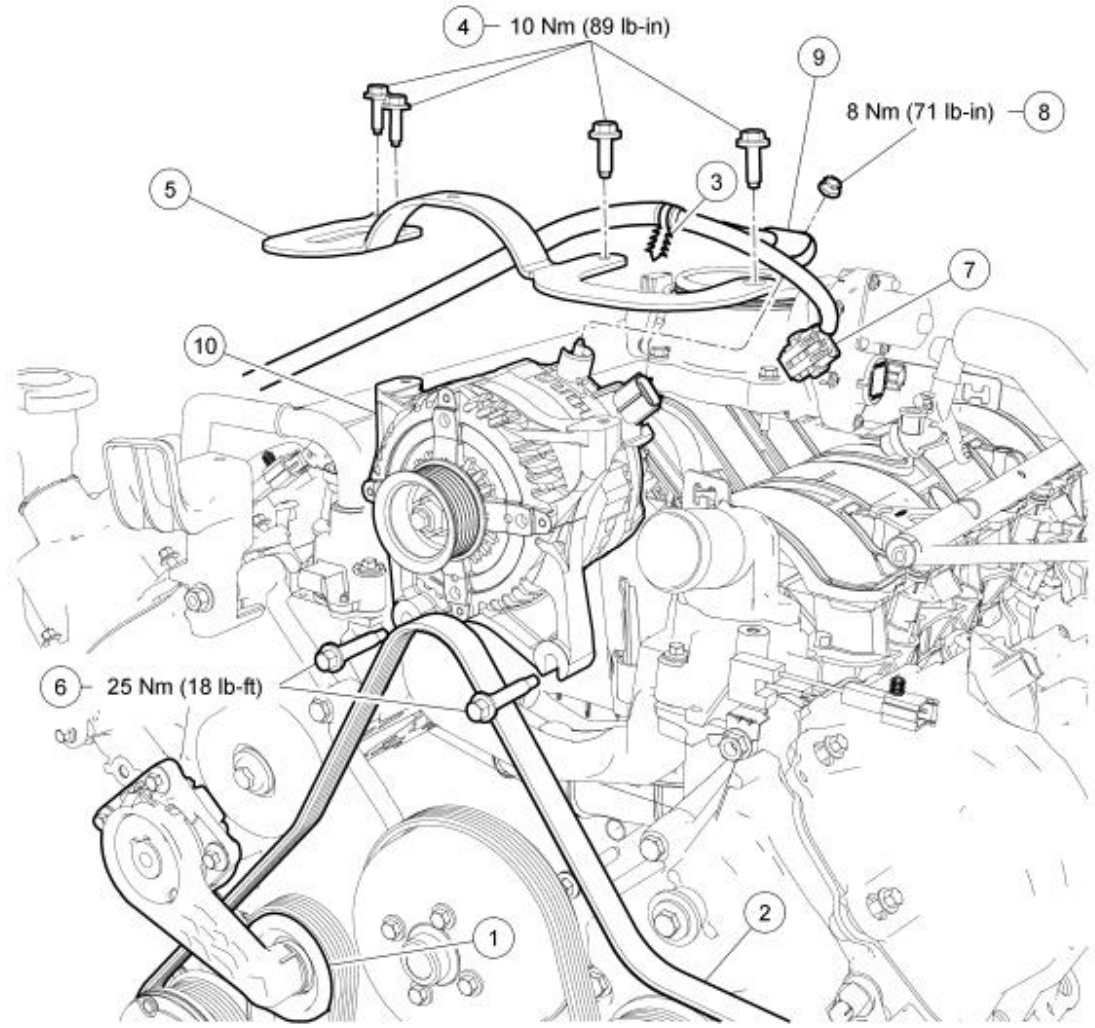

Fig. 1: Exploded View Of Generator (With Torque Specifications)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	6B209	Front end accessory drive belt tensioner
2	8620	Front end accessory drive belt
3	-	Generator harness locator
4	N807309	Generator bracket bolts (4 required)
5	10153	Generator bracket
6	N811334	Generator bolts (2 required)
7	-	Generator electrical connector (part of 12B637)
8	W705790-S901	Generator B+ terminal nut
9	-	Generator B+ terminal (part of 12B637)
10	10300	Generator

REMOVAL AND INSTALLATION

CAUTION: Do not allow any metal object to come in contact with the generator housing and internal diode cooling fins. A short circuit may result and burn out the diodes.

1. Disconnect the battery. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
2. For Navigator, release the 2 retainers and remove the engine cover.
3. Remove the air cleaner intake pipe. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING** article.
4. Rotate the front end accessory drive belt tensioner counterclockwise and position the accessory drive belt aside.
5. Remove the harness locator from the generator bracket.
6. Remove the 4 bolts and the generator bracket.
   - To install, tighten to 10 Nm (89 lb-in).
7. Remove the 2 bolts and position the generator aside.
   - Tighten to 25 Nm (18 lb-ft).
8. Disconnect the generator electrical connector.
9. Position the generator B+ protective cover aside, remove and discard the nut, then position the generator B+ terminal aside.
   - Install a new B+ terminal nut; tighten to 8 Nm (71 lb-in).
10. Remove the generator.
11. To install, reverse the removal procedure.

2007 ENGINE

Starting System - Expedition, Expedition EL, Navigator & Navigator L

SPECIFICATIONS

GENERAL SPECIFICATIONS

GENERAL SPECIFICATIONS

Item	Specification
Starting System	
Normal engine cranking speed	140-220 rpm
Starter motor armature shaft maximum runout	0.11 mm (0.004 in)
Starter motor brush manufactured length	16.8 mm (0.66 in)
Starter motor brush spring tension	18 N (65 oz)
Starter motor commutator maximum runout	0.12 mm (0.005 in)
Starter motor diameter	101.6 mm (4.0 in)
Starter motor maximum load	800 amps
Starter motor minimum stall torque (at 5 volts)	14.7 N.m (10.8 lb-ft)
Starter motor no load current draw	60-80 amps
Starter motor normal load current draw	130-220 amps
Starter circuit maximum voltage drop (engine at normal operating temperature)	0.5 volts

Starter motor ground cable nut	25	18	-
Starter solenoid B terminal nut	12	9	-
Starter solenoid S terminal nut	6	-	53

DESCRIPTION AND OPERATION

STARTING SYSTEM

The starting system consists of the following:

- Starter motor
- Starter motor relay
- Starter drive
- Battery
- Transmission range (TR) sensor
- Ignition switch

- Powertrain control module (PCM)
- One-touch integrated start (OTIS) diode (Late built vehicles)

The function of the starting system is to crank the engine at a speed fast enough to permit the engine to start. When the starter solenoid is energized, a magnetic field is created in the starter solenoid windings. The iron plunger core is drawn into the starter solenoid coil, and a drive lever and pin connected to the starter drive engages the drive pinion gear to the flexplate ring gear. When the plunger is pulled all the way in, the contact disc closes the circuit between the battery and the motor feed terminals. This sends current to the motor and the drive pinion gear cranks the flexplate to start the engine. When current flows to the starter motor, the starter solenoid pull-in coil is bypassed, and the hold-in coil keeps the drive pinion gear engaged with the flexplate.

Automatic transmissions have a transmission range (TR) sensor in the transmission. The TR sensor prevents operation of the starter motor unless NEUTRAL or PARK is selected.

Late Build Vehicles - One-Touch Integrated Start (OTIS)

This vehicle has one-touch integrated start (OTIS), a computer-assisted cranking system. This feature assists in starting the engine. If the ignition key is turned to the START position and released when the engine begins cranking, the engine may continue cranking for up to 10 seconds or until the vehicle starts.

Once the ignition is turned to the START position, the PCM reads starter motor request (SMR) from the ignition switch and gains control of the starter engagement. The customer is no longer in the loop after the initial crank request, the customer may release the key to the RUN/START position. The PCM will disengage the starter motor based on the following events:

- The engine is started (RPM threshold)
- A set time has been exceeded
- The ignition key has been turned to the OFF position

DIAGNOSTIC TESTS

STARTING SYSTEM

Special Tools

Illustration	Tool Name	Tool Number
ST1137-A	73III Automotive Meter	105-R0057 or equivalent
ST2574-A	Flex Probe Kit	105-R025C or equivalent
	Vehicle Communication Module (VCM) and Integrated Diagnostic	

ST2834-A	System (IDS) software with appropriate hardware, or equivalent scan tool	

Principles of Operation

The starting system is electronically controlled by PCM. The PCM recognizes the signal from the ignition switch and provides a ground for the starter relay. The energized relay provides voltage to the starter solenoid, thereby allowing the starter motor to activate.

Starting System - Anti-Theft Intervention

The starting system is electronically controlled by the passive anti-theft system (PATS). The PATS recognizes the correct electronically coded ignition key and signals the PCM to provide a ground for the starter relay. The energized relay provides voltage to the starter solenoid, thereby allowing the starter motor to activate.

Inspection and Verification

WARNING: Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.

NOTE: The PATS must be functioning correctly before a logical starting system diagnosis can be carried out. Address PATS concerns before continuing.

1. Verify the customer concern by operating the starting system to duplicate the condition.
2. Inspect to determine if any of the following mechanical or electrical concerns apply.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Starter motor • Brackets • Starter motor bolts • Flexplate	• Battery • Failed battery junction box (BJB) fuse 40 (30A) • Failed smart junction box (SJB) fuse 27 (20A) • Circuitry • Loose or corroded connections

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the PCM.
9. If the DTCs retrieved are related to the concern, go to PCM DTC Chart or the Starter and PATS DTC Chart. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

PCM DTC CHART

DTC	Description	Source	Action
P0512	Starter Request Circuit - Circuit has Power With the Ignition in the OFF Position	PCM	CARRY OUT the Ignition Switch Component Test. Refer to COMPONENT TESTING. If necessary, INSTALL a new ignition switch. If the ignition switch passed the component test, REPAIR circuit CDC35 (BU/WH) for a short to power.
P0701	Transmission Control System - Range Operation	PCM	Refer to the appropriate Automatic Transmission article for the procedure..
P0705	Transmission Range (TR) Sensor Circuit Error	PCM	Refer to the appropriate Automatic Transmission article for the procedure..

PASSIVE ANTI-THEFT SYSTEM (PATS) - DTC CHART

DTC	Description	Source	Action
B1213	Anti-Theft Number of Programmed Keys is Below Minimum	Instrument Cluster	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.

B1342	Electronic Control Unit (ECU) is Faulted	Instrument Cluster	CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new instrument cluster. REFER to **INSTRUMENT CLUSTER** article. CYCLE the ignition. REPEAT the self-test.
B1600	PATS Key Transponder is Not Received	Instrument Cluster	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B1601	PATS Received Incorrect Key-Code From Ignition Key Transponder	Instrument Cluster	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B1602	PATS Received Invalid Format of Key-Code From Ignition Key Transponder	Instrument Cluster	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B1681	PATS Transceiver Module Signal is Not Received	Instrument Cluster	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B2103	Antenna Not Connected	Instrument Cluster	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B2141	Non Volatile Memory (NVM) Configuration	Instrument Cluster	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B2431	Transponder Programming Failed	Instrument Cluster	The ignition key was not programmed. PROGRAM the key. REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The engine does not crank and the relay does click (all vehicles)	• Battery • Battery junction box (BJB) fuse 40 (30A) • BJB • Starter motor/solenoid • Circuit	• Go to **Pinpoint Test A**.
• The engine does not crank and the relay does not click (early build vehicles)	• PCM • Smart junction box (SJB) • BJB • Battery • Starter relay	• Go to **Pinpoint Test B**.

	• Ignition switch • Circuit	
• The engine does not crank and the relay does not click (late build vehicles)	• PCM • SJB • BJB • Battery • Starter relay • Start diode • Ignition switch • Circuit	• Go to **Pinpoint Test C**.

Pinpoint Tests

Pinpoint Test A: The Engine Does Not Crank and the Relay Does Click (All Vehicles)

Refer to **SYSTEM WIRING DIAGRAMS** (Expedition), **SYSTEM WIRING DIAGRAMS** (Expedition EL), **SYSTEM WIRING DIAGRAMS** (Navigator) or **SYSTEM WIRING DIAGRAMS** (Navigator L) for schematic and connector information.

Normal Operation

In normal operation, constant voltage is supplied to the battery junction box (BJB) fuse 40 (30A) and to the stater relay pin 30. Voltage is supplied from the smart junction box (SJB) through circuit SBP27 (BU/RD) to the ignition switch. When the ignition switch is placed in the START position, voltage is supplied through circuit CDC35 (BU/WH) to circuit CDC38 (WH/VT) to the starter relay located in the BJB. The starter relay coil is supplied ground from the PCM through circuit CDC12 (YE). When the starter relay is energized, voltage supplied to the relay switch from BJB fuse 40 (30A) is sent to the starter motor solenoid through circuit CDC25 (BN/GN). Battery voltage is supplied to the starter motor through circuit SDC02 (RD) at all times.

This pinpoint test is intended to diagnose the following:

- Failed BJB fuse 40 (30A)
- An open in circuit CDC25 (BN/GN), SDC04 or SDC02 (RD)
- Starter motor relay
- Starter

PINPOINT TEST A: THE ENGINE DOES NOT CRANK AND THE RELAY DOES CLICK (ALL VEHICLES)

A1 CHECK THE STARTER MOTOR GROUND

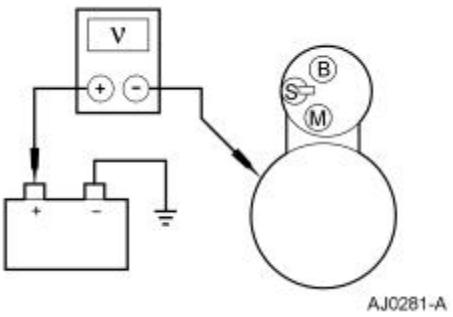

Fig. 1: Checking Starter Motor Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between the battery positive post and the starter motor case.
- **Is the voltage reading greater than 10 volts?**

  YES : Go to A2.

  NO : CLEAN the starter motor mounting flange and make sure the starter motor is correctly mounted. TEST the system for normal operation.

A2 CHECK THE VOLTAGE TO THE STARTER MOTOR SOLENOID

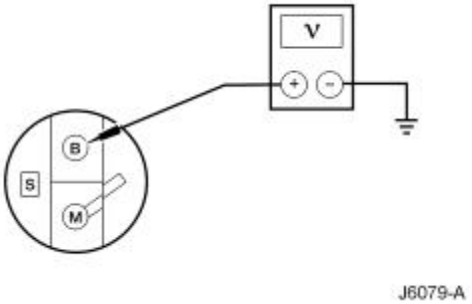

Fig. 2: Checking Voltage To Starter Motor Solenoid
Courtesy of FORD MOTOR CO.

- Measure the voltage between the starter motor solenoid positive terminal and ground.
- **Is the voltage 10 volts or greater?**

  YES : Go to A3.

  NO : REPAIR circuit SDC02 (RD) for an open. TEST the system for normal operation.

A3 MANUALLY JUMP THE STARTER MOTOR

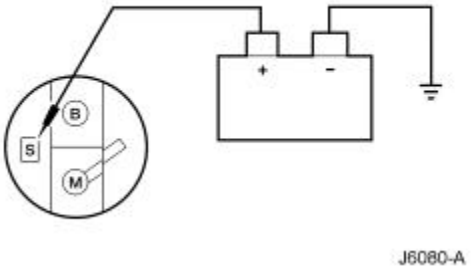

Fig. 3: Manually Jump Starter Motor
Courtesy of FORD MOTOR CO.

- Connect one end of a fused (15A) jumper wire to the positive terminal of the battery and touch the other end to the starter solenoid S-terminal.
- **Does the starter solenoid engage and the starter motor crank?**

  YES : Go to A4.

  NO : INSTALL a new starter motor. REFER to **Starter Motor**. TEST the system for normal operation.

A4 CHECK THE START INPUT TO THE STARTER MOTOR

- Disconnect: Starter S-Connector
- Key in START position.

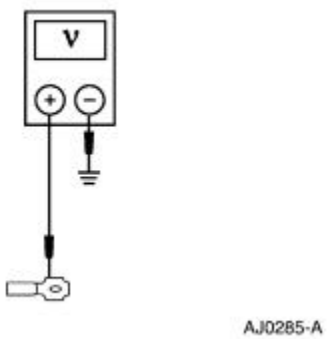

Fig. 4: Checking Start Input To Starter Motor
Courtesy of FORD MOTOR CO.

- Measure the voltage at the starter motor solenoid S-terminal.
- **Is the voltage reading greater than 10 volts?**

  YES : CLEAN the starter motor solenoid S-terminal and connector. CHECK the wiring and the starter motor for a loose or intermittent connection. TEST the system for normal operation.

  NO : Go to A5.

A5 CHECK THE BATTERY SUPPLY TO THE STARTER RELAY

- Key in OFF position.
- Disconnect: Starter Motor Relay

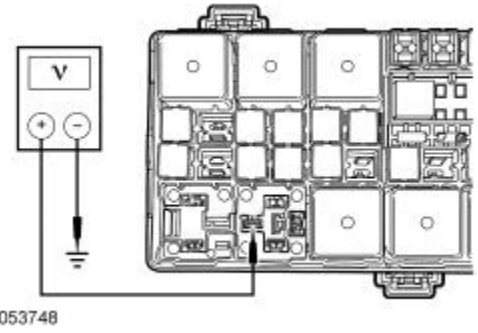

Fig. 5: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage at starter motor relay connector pin 30.
- **Is the voltage reading greater than 10 volts?**

  YES : Go to A9.

  NO : Go to A6.

A6 CHECK BJB FUSE 40 (30A) FOR AN OPEN

- Key in OFF position.
- Disconnect: BJB Fuse 40 (30A)
- Check fuse: BJB Fuse 40 (30A)
- **Is BJB fuse 40 (30A) open?**

  YES : Go to A7.

  NO : Go to A8.

A7 CHECK CIRCUIT CDC25 (BN/GN) FOR A SHORT TO GROUND

- Disconnect: Starter Solenoid S-Connector

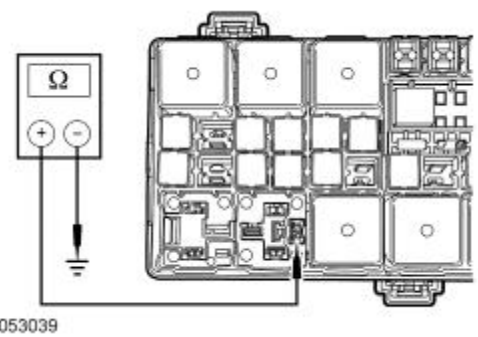

Fig. 6: Checking Circuit For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance of circuit CDC25 (BN/GN) between starter relay connector pin 87 and the starter solenoid S-connector.
- **Is the resistance less than 10,000 ohms?**

  YES : REPAIR circuit CDC25 (BN/GN) for a short to ground. INSTALL a new BJB fuse 40 (30A). TEST the system for normal operation.

  NO : INSTALL a new BJB fuse 40 (30A). TEST the system for normal operation.

A8 CHECK CIRCUIT SDC04 (RD) FOR POWER SUPPLY TO THE BJB

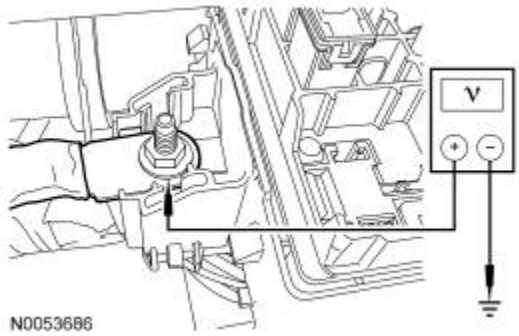

Fig. 7: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the BJB power supply terminal, circuit SDC04 (RD) and ground.
- **Is the voltage 10 volts or greater?**

  YES : INSTALL a new BJB.

  NO : REPAIR circuit SDC04 (RD) for an open. TEST the system for normal operation.

A9 CHECK CIRCUIT CDC25 (BN/GN) FOR AN OPEN

- Disconnect: Starter Solenoid S-Connector

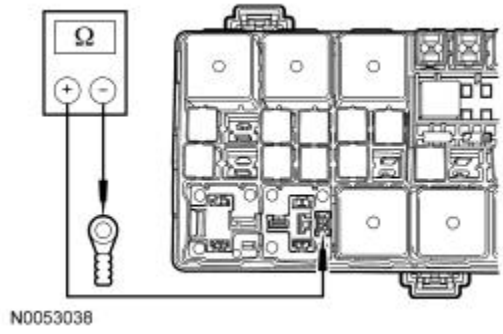

Fig. 8: Checking Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance of circuit CDC25 (BN/GN) between starter relay connector pin 87 and the starter solenoid S-connector.
- **Is the resistance reading 5 ohms or less?**

  YES : INSTALL a new starter relay. TEST the system for normal operation.

  NO : REPAIR circuit CDC25 (BN/GN) for an open. TEST the system for normal operation.

Pinpoint Test B: The Engine Does Not Crank and the Relay Does Not Click (Early Build Vehicles)

Refer to **SYSTEM WIRING DIAGRAMS** (Expedition), **SYSTEM WIRING DIAGRAMS** (Expedition EL), **SYSTEM WIRING DIAGRAMS** (Navigator) or **SYSTEM WIRING DIAGRAMS** (Navigator L) for schematic and connector information.

Normal Operation

In normal operation, constant voltage is supplied to the battery junction box (BJB) fuse 40 (30A) and to the stater relay pin 30. Voltage is supplied from the smart junction box (SJB) through circuit SBP27 (BU/RD) to the ignition switch. When the ignition switch is placed in the START position, voltage is supplied through

circuit CDC35 (BU/WH) to circuit CDC38 (WH/VT) to the starter relay located in the BJB. The starter relay coil is supplied ground from the PCM through circuit CDC12 (YE). When the starter relay is energized, voltage supplied to the relay switch from BJB fuse 40 (30A) is sent to the starter motor solenoid through circuit CDC25 (BN/GN). Battery voltage is supplied to the starter motor through circuit SDC02 (RD) at all times.

This pinpoint test is intended to diagnose the following:

- Battery
- An open in circuit CDC38 (WH/VT), CDC12 (YE) or CDC35 (BU/WH)
- PCM
- SJB
- Ignition switch
- Starter motor relay

PINPOINT TEST B: THE ENGINE DOES NOT CRANK AND THE RELAY DOES NOT CLICK (EARLY BUILD VEHICLES)

B1 CHECK THE BATTERY

- Check the battery condition and charge. Refer to **BATTERY, MOUNTING AND CABLES** article.
- **Is the battery OK?**

  YES : Go to B2.

  NO : CHARGE or INSTALL a new battery as required. TEST the system for normal operation.

B2 CHECK CIRCUIT CDC38 (WH/VT) FOR VOLTAGE

- Disconnect: Starter Motor Relay
- Key in START position.

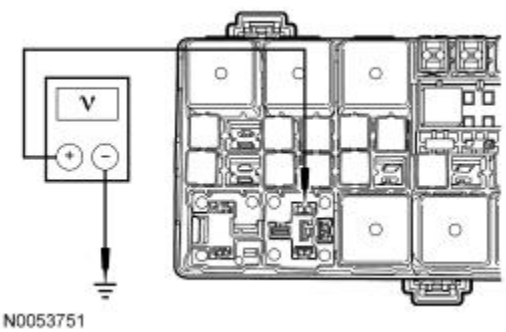

Fig. 9: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between starter motor relay pin 85, circuit CDC38 (WH/VT) and ground while holding the key in the START position.
- **Is the voltage greater than 10 volts?**

  YES : Go to B7.

  NO : Go to B3.

B3 CHECK THE START INPUT FROM THE SJB

- Key in START position.
- Disconnect: SJB C2280A

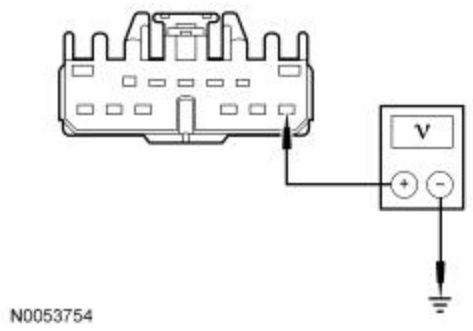

Fig. 10: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage at SJB C2280A-8, while holding the key in the START position.
- **Is the voltage reading greater than 10 volts?**
  YES : REPAIR circuit CDC38 (WH/VT) for an open. TEST the system for normal operation.
  NO : Go to B4.

B4 CHECK THE START INPUT TO THE SJB

- Key in START position.
- Disconnect: SJB C2280G

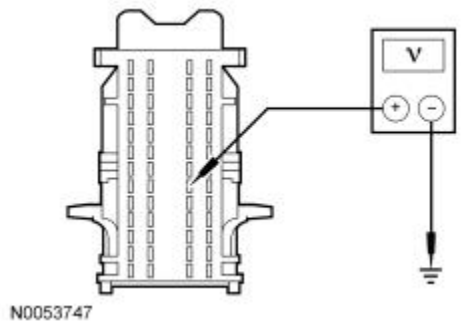

Fig. 11: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage at SJB C2280G-32, while holding the key in the START position.
- **Is the voltage reading greater than 10 volts?**
  YES : INSTALL a new SJB. TEST the system for normal operation.
  NO : Go to B5.

B5 CHECK FOR START INPUT FROM THE IGNITION SWITCH

- Disconnect: Ignition Switch C250
- Key in START position.

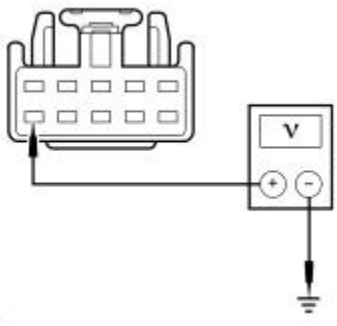

Fig. 12: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage at ignition switch C250-10, from the harness side, while holding the key in the START position.
- **Is the voltage reading greater than 10 volts?**

  YES : REPAIR circuit CDC35 (BU/WH) for an open. TEST the system for normal operation.

  NO : Go to B6.

B6 CHECK THE IGNITION SWITCH

- Carry out the Ignition Switch Component Test. Refer to COMPONENT TESTING article.
- **Did the ignition switch pass the component test?**

  YES : REPAIR circuit SBP27 (BU/RD) for an open. TEST the system for normal operation.

  NO : INSTALL a new ignition switch. REFER to **STEERING COLUMN SWITCHES** article. TEST the system for normal operation.

B7 CHECK THE STARTER RELAY GROUND

- Key in START position.
- Disconnect: Starter Motor Relay

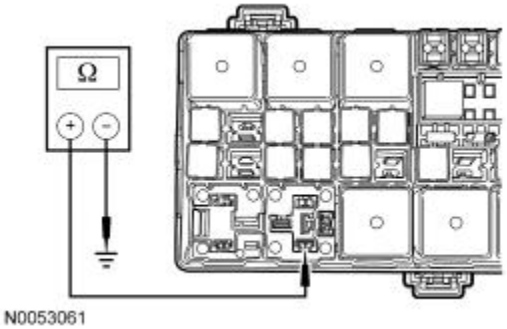

Fig. 13: Checking Circuit For Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between starter motor relay connector pin 86, circuit CDC12 (YE) and ground while holding the key in the START position.
- **Is the resistance reading 5 ohms or less?**

  YES : INSTALL a new starter relay. TEST the system for normal operation.

  NO : Go to B8.

B8 CHECK CIRCUIT CDC12 (YE) FOR AN OPEN

- Disconnect: PCM C175B

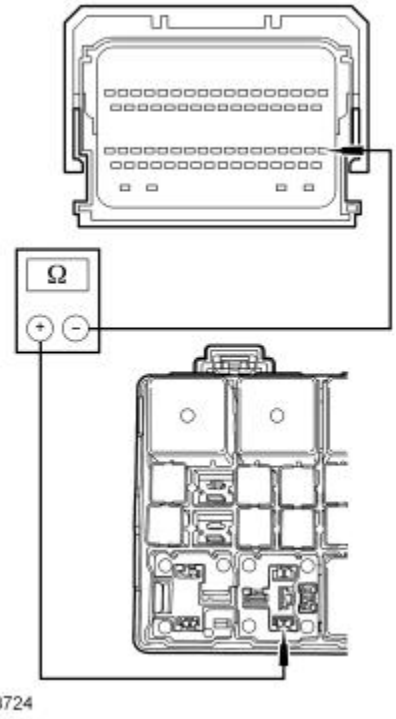

Fig. 14: Checking Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between starter motor relay connector pin 86, circuit CDC12 (YE) and PCM C175B-34.
- **Is the resistance reading 5 ohms or less?**

  YES : DIAGNOSE the PCM. REFER to the **Introduction - Gasoline Engines** article.

  NO : REPAIR circuit CDC12 (YE) for an open. TEST the system for normal operation.

Pinpoint Test C: The Engine Does Not Crank and the Relay Does Not Click (Late Build Vehicles)

Refer to **SYSTEM WIRING DIAGRAMS** (Expedition), **SYSTEM WIRING DIAGRAMS** (Expedition EL), **SYSTEM WIRING DIAGRAMS** (Navigator) or **SYSTEM WIRING DIAGRAMS** (Navigator L) for schematic and connector information.

Normal Operation

Under normal operation, when the ignition switch is turned in the START position and released, the PCM receives a starter motor request (SMR) signal through circuit CDC35 (BU/WH), power is then supplied to the starter relay through circuit CDC38 (WH/VT) from the PCM. The PCM will receive a signal from the digital transmission range (TR) sensor that the vehicle is in PARK or NEUTRAL through circuit CET40 (GN/OG). A ground is supplied through circuit CDC12 (YE) from the PCM causing the starter relay coil to energize and the relay contacts to close. This allows power to be supplied from battery junction box (BJB) fuse 40 (30A) to the relay contacts, which then flows through circuit CDC25 (BN/GN) to the starter solenoid. The solenoid is grounded at the starter motor. Energizing the starter solenoid will engage the starter drive into the ring gear and close the solenoid contacts allowing power directly from the battery through circuit SDC02 (RD) to the starter motor to start the engine. The PCM will disengage the starter motor based on engine running (RPM threshold), a set crank time has been exceeded or the ignition switch

has been turned to the OFF position.

This pinpoint test is intended to diagnose the following:

- Battery
- Ignition switch
- Starter relay
- Anti-theft system
- Circuitry
- PCM
- Start diode

PINPOINT TEST C: THE ENGINE DOES NOT CRANK AND THE RELAY DOES NOT CLICK (LATE BUILD VEHICLES)

C1 CHECK THE BATTERY

- Check the battery condition and charge. Refer to **BATTERY, MOUNTING AND CABLES** article.
- **Is the battery OK?**

  YES : Go to C2.

  NO : CHARGE or INSTALL a new battery as necessary. REFER to **BATTERY, MOUNTING AND CABLES** article. TEST the system for normal operation.

C2 CHECK FOR PASSIVE ANTI-THEFT SYSTEM (PATS) DTCs

NOTE: PATS DTCs are the only DTCs of concern in this step. Only repair retrieved non-PATS DTCs if a customer concern is reported.

- Check for PATS DTCs.
- **Were any PATS DTCs retrieved?**

  YES : REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article to diagnose the PATS DTCs.

  NO : Go to C3.

C3 CHECK THE TR SENSOR PID

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger/PID
- While observing the PCM TR sensor PID, place the vehicle in PARK and NEUTRAL.
- **Does the PID match the gear selection?**

  YES : Go to C5.

  NO : Go to C4.

C4 CHECK CIRCUIT CET40 (GN/OG) FOR AN OPEN

- Disconnect: Transmission C1548
- Disconnect: PCM C175B

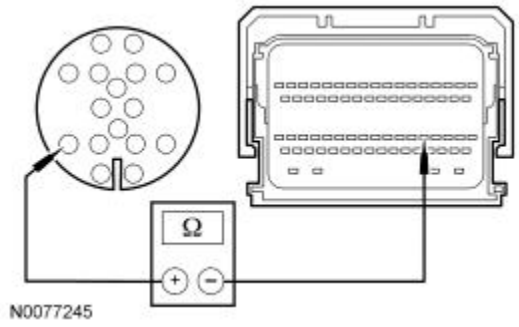

Fig. 15: Checking Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between transmission C175B-10 circuit CET40 (GN/OG), harness side, and PCM C175B-38, circuit CET40 (GN/OG), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to the appropriate automatic transmission section to diagnose the TR sensor.

  NO : REPAIR the circuit CET40 (GN/OG). TEST the system for normal operation.

C5 CHECK CIRCUIT CDC35 (BU/WH) FOR VOLTAGE AT THE START DIODE

- Disconnect: Start Diode
- Key in START position.

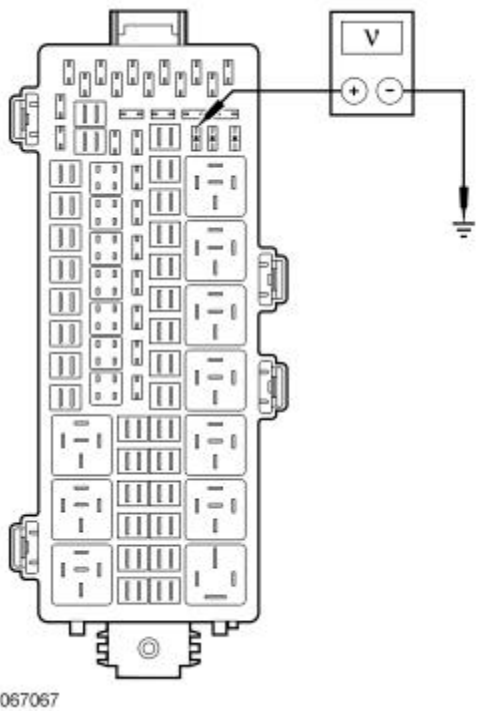

Fig. 16: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between BJB start diode cell, circuit CDC35 (BU/WH) and ground with the ignition switch in the START position.
- **Is the voltage greater than 10 volts?**

YES : Go to C8.

NO : Go to C6.

C6 CHECK CIRCUIT SBB27 (BU/RD) FOR VOLTAGE

- Disconnect: Ignition Switch C250

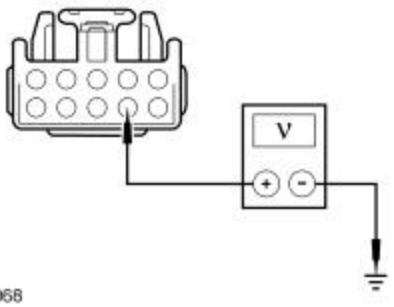

Fig. 17: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between ignition switch C250-7, circuit SBP27 (BU/RD) and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to C7.

  NO : REPAIR circuit SBB27 (BU/RD). TEST the system for normal operation.

C7 CHECK THE IGNITION SWITCH

- Carry out the Ignition Switch Component Test. Refer to COMPONENT TESTING article.
- **Did the ignition switch pass the component test?**

  YES : REPAIR circuit CDC35 (BU/WH) for an open. TEST the system for normal operation.

  NO : INSTALL a new ignition switch. REFER to **STEERING COLUMN SWITCHES** article. TEST the system for normal operation.

C8 CHECK CIRCUIT CDC35 (BU/WH) FOR AN OPEN

- Key in OFF position.
- Disconnect: Start Diode
- Disconnect: PCM C175B

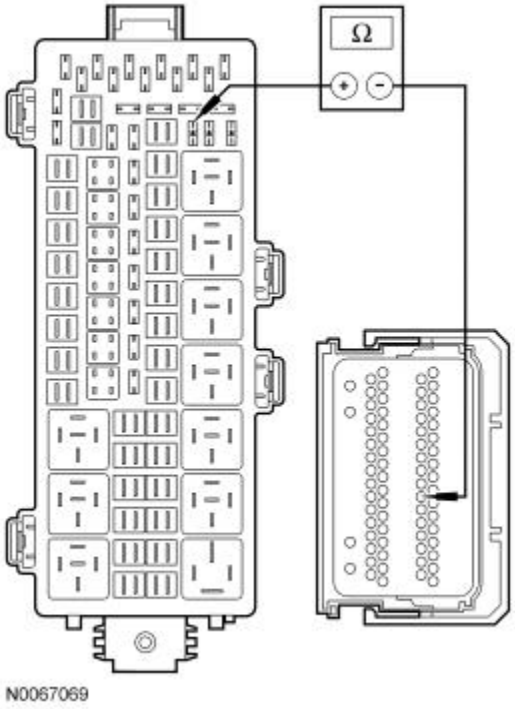

Fig. 18: Checking Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between BJB start diode cell, circuit CDC35 (BU/WH) and PCM C175B-24, circuit CDC35 (BU/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to C9.

  NO : REPAIR the circuit CDC35 (BU/WH). TEST the system for normal operation.

C9 CHECK THE START DIODE

- Check the start diode.
- **Is the start diode open or shorted?**

  YES : INSTALL a new start diode. TEST the system for normal operation.

  NO : Go to C10.

C10 CHECK CIRCUIT CDC38 (WH/VT) FOR VOLTAGE

- Connect: Start Diode
- Connect: PCM C175B
- Disconnect: Starter Motor Relay
- Key in START position.

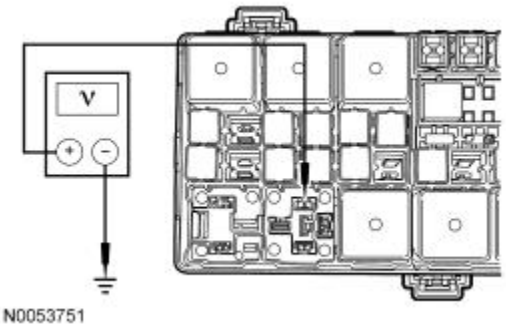

Fig. 19: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between BJB starter motor relay connector pin 85, circuit CDC38 (WH/VT) and ground with the ignition switch in the START position.
- **Is the voltage greater than 10 volts?**

  YES : Go to C11.

  NO : REPAIR circuit CDC38 (WH/VT). TEST the system for normal operation.

C11 CHECK PCM CIRCUIT CDC38 (WH/VT) FOR AN OPEN

- Key in OFF position.
- Disconnect: PCM C175B

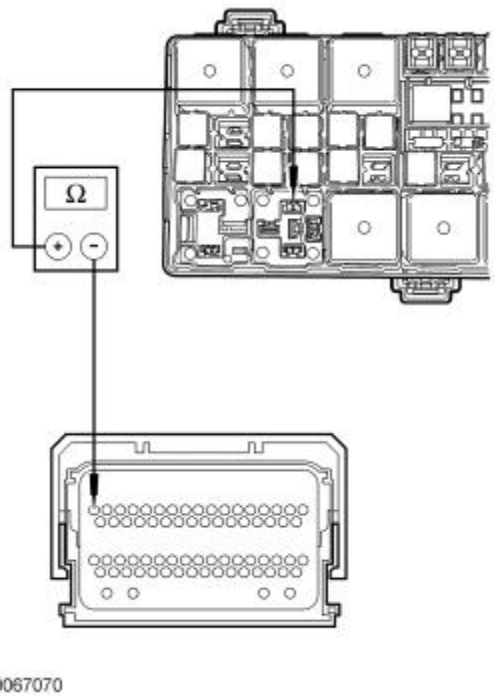

Fig. 20: Checking Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between PCM C175B-17, circuit CDC38 (WH/VT), harness side and BJB starter relay pin 85, circuit CDC38 (WH/VT).
- **Is the resistance reading 5 ohms or less?**

YES : Go to C12.

NO : REPAIR circuit CDC38 (WH/VT). TEST the system for normal operation.

C12 CHECK CIRCUIT CDC12 (YE) FOR AN OPEN

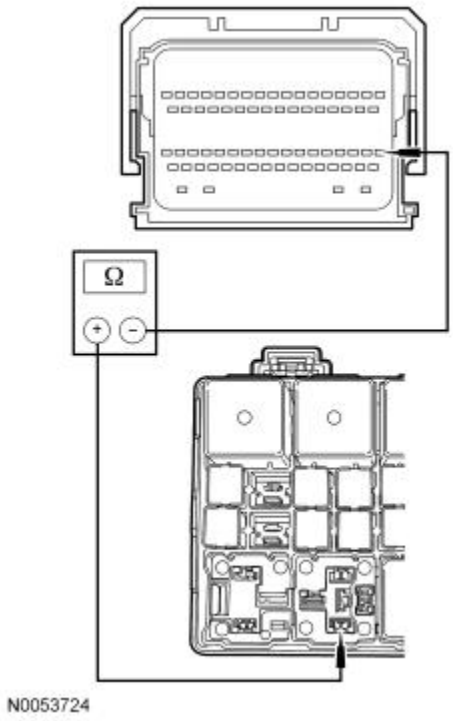

Fig. 21: Checking Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the starter motor relay connector pin 86, circuit CDC12 (YE) and PCM C175B-34, circuit CDC12 (YE).
- **Is the resistance reading 5 ohms or less?**

  YES : DIAGNOSE the PCM. REFER to the **Introduction - Gasoline Engines** article.

  NO : REPAIR circuit CDC12 (YE) for an open. TEST the system for normal operation.

Pinpoint Test D: The Engine Cranks Slowly

Refer to **SYSTEM WIRING DIAGRAMS** (Expedition), **SYSTEM WIRING DIAGRAMS** (Expedition EL), **SYSTEM WIRING DIAGRAMS** (Navigator) or **SYSTEM WIRING DIAGRAMS** (Navigator L) for schematic and connector information.

Normal Operation

In normal operation, constant voltage is supplied to the battery junction box (BJB) fuse 40 (30A) and to the stater relay pin 30. Voltage is supplied from the smart junction box (SJB) through circuit SBP27 (BU/RD) to the ignition switch. When the ignition switch is placed in the START position, voltage is supplied through circuit CDC35 (BU/WH) to circuit CDC38 (WH/VT) to the starter relay located in the BJB. The starter relay coil is supplied ground from the PCM through circuit CDC12 (YE). When the starter relay is energized, voltage supplied to the relay switch from BJB fuse 40 (30A) is sent to the starter motor solenoid through circuit CDC25 (BN/GN). Battery voltage is supplied to the starter motor through circuit SDC02 (RD) at all times.

This pinpoint test is intended to diagnose the following:

- Battery
- Circuit CDC25 (RD)
- Ground circuit
- Starter motor

PINPOINT TEST D: THE ENGINE CRANKS SLOWLY

D1 CHECK THE BATTERY

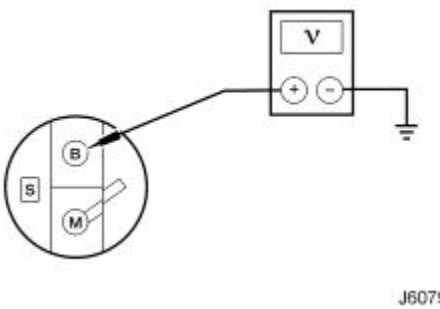
- Check the battery condition and charge. Refer to **BATTERY, MOUNTING AND CABLES** article.
- **Is the battery OK?**

  YES : Go to D2.

  NO : CHARGE or INSTALL a new battery as required. TEST the system for normal operation.

D2 CHECK THE VOLTAGE TO THE STARTER

- Key in OFF position.



J6079-A

Fig. 22: Checking Voltage To Starter Motor Solenoid
Courtesy of FORD MOTOR CO.

- Measure the voltage between the starter motor solenoid positive terminal and ground.
- **Is the voltage 12.0 volts or greater?**

  YES : Go to D3.

  NO : REPAIR circuit CDC25 (RD). CLEAN and TIGHTEN the connections at the battery terminals. TEST the system for normal operation.

D3 CHECK THE MOTOR GROUND CIRCUIT

- Carry out the Motor Ground Circuit Test. Refer to the component tests.
- **Is the ground OK?**

  YES : INSTALL a new starter motor. TEST the system for normal operation.

  NO : REPAIR the ground circuit as necessary. TEST the system for normal operation.

Pinpoint Test E: Unusual Starter Noise

Normal Operation

In normal operation, constant voltage is supplied to the battery junction box (BJB) fuse 40 (30A) and to the

stater relay pin 30. Voltage is supplied from the smart junction box (SJB) through circuit SBP27 (BU/RD) to the ignition switch. When the ignition switch is placed in the START position, voltage is supplied through circuit CDC35 (BU/WH) to circuit CDC38 (WH/VT) to the starter relay located in the BJB. The starter relay coil is supplied ground from the PCM through circuit CDC12 (YE). When the starter relay is energized, voltage supplied to the relay switch from BJB fuse 40 (30A) is sent to the starter motor solenoid through circuit CDC25 (BN/GN). Battery voltage is supplied to the starter motor through circuit SDC02 (RD) at all times.

This pinpoint test is intended to diagnose the following:

- Starter motor mounting
- Starter motor mounting bolts
- Starter motor drive
- Flywheel or flexplate ring gear
- Starter motor

PINPOINT TEST E: UNUSUAL STARTER NOISE

E1 CHECK THE STARTER MOTOR MOUNTING

- Inspect the starter motor mounting bolts for looseness.
- **Is the starter motor mounted correctly?**

  YES : Go to E2.

  NO : REINSTALL the starter motor correctly. REFER to **Starter Motor**.

E2 CHECK FOR ENGINE NOISE

- Key in OFF position.

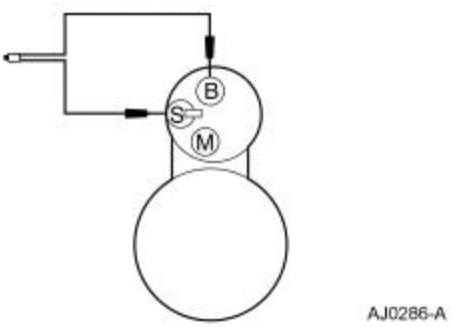


Fig. 23: Connecting Remote Starter Switch Between Starter Solenoid B & S Terminals
Courtesy of FORD MOTOR CO.

- Connect a remote starter switch between the starter solenoid B- and S- terminals.
- Engage the starter motor and verify that the noise is due to the starter operation.
- **Is the noise due to the starter motor engagement?**

  YES : Go to E3.

  NO : REFER to **ENGINE SYSTEM - GENERAL INFORMATION** article to continue the diagnosis.

E3 CHECK FOR UNUSUAL WEAR

- Remove the starter motor. Refer to **Starter Motor**.

- Inspect the flexplate for damaged or worn teeth.
- **Is the noise due to ring gear tooth damage?**

  YES : INSTALL a new flexplate. REFER to **ENGINE** article. EXAMINE the starter pinion teeth. If damaged, INSTALL a new starter motor. REFER to **Starter Motor**. TEST the system for normal operation.

  NO : INSTALL a new starter motor. REFER to **Starter Motor**. TEST the system for normal operation.

Component Tests

WARNING: Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.

Always make the 73III Automotive Meter connections at the component terminal rather than at the wiring end connector. Making a connection at the wiring end connector could result in false readings because the meter will not pick up a high resistance between the wiring connector and the component.

Starter Motor - Motor Feed Circuit

1. Make sure the battery is fully charged; carry out a battery load test. Refer to **BATTERY, MOUNTING AND CABLES** article.
2. Disconnect the inertia fuel shutoff (IFS) switch.
3. Connect a remote starter switch between the starter solenoid S-terminal and the battery positive (+) terminal.
4. Connect the 73III Automotive Meter positive lead to the battery positive (+) post. Connect the negative lead to the starter solenoid M-terminal.

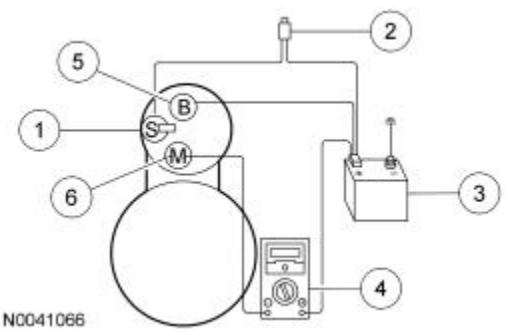

Fig. 24: Identifying S,M,B-Terminal, 73III Automotive Meter, Battery & Remote Starter Switch
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	S-terminal
2	-	Remote starter switch
3	10653	Battery
		73III

4	-	Automotive Meter
5	-	B-terminal
6	-	M-terminal

5. Engage the remote starter switch. Read and record the voltage. The voltage reading should be 0.5 volt or less.
6. If the voltage reading is 0.5 volt or less, go to the starter motor-ground circuit component test.
7. If the voltage reading is greater than 0.5 volt, this is an indication of excessive resistance in the connections, the positive battery cable or in the starter solenoid. Move the 73III Automotive Meter negative lead to the starter solenoid B-terminal and repeat the test. If the voltage reading at the B-terminal is lower than 0.5 volt, the concern is either in the connections at the starter solenoid or in the solenoid contacts.

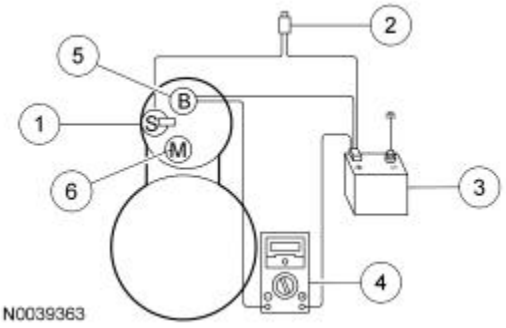

Fig. 25: Identifying S,M,B-Terminal, 73III Automotive Meter, Battery & Remote Starter Switch
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	S-terminal
2	-	Remote starter switch
3	10653	Battery
4	-	73III Automotive Meter
5	-	B-terminal
6	-	M-terminal

8. Remove the cables from solenoid B-, S- and M-terminals. Clean the cables and connections and reinstall the cables to the correct terminals. Repeat Steps 3 through 6. If the voltage drop reading is still greater than 0.5 volt when checked at the M-terminal or less than 0.5 volt when checked at the B-terminal, the concern is in the solenoid contacts. Install a new starter motor.
9. If the voltage reading taken at the solenoid B-terminal is still greater than 0.5 volt after cleaning the cables and connections at the solenoid, the concern is either in the positive (+) battery cable connection or in the positive battery cable itself.
10. Clean the positive (+) battery cable connection. If this does not solve the problem, install a new positive battery cable.

Starter Motor - Ground Circuit

A slow cranking condition can be caused by resistance in the ground or return portion of the cranking circuit. Check the voltage drop in the ground circuit as follows:

1. Connect the 73III Automotive Meter positive lead to the starter motor housing (the connection must be clean and free of rust or grease). Connect the negative lead to the negative (-) battery terminal.
2. Engage the remote starter switch and crank the engine. Read and record the voltage reading. The reading should be 0.2 volt or less.
3. If the voltage drop is more than 0.2 volt, clean the negative cable connections at the battery, the body ground connections and the starter ground connection. Retest.
4. If the voltage drop is greater than 0.2 volt, install a new cable. If the voltage reading is less than 0.2 volt and the engine still cranks slowly, install a new starter motor.

REMOVAL AND INSTALLATION

STARTER MOTOR

REMOVAL

WARNING: Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Disconnect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
3. Remove the starter terminal cover and remove the nut and the solenoid S-terminal electrical connection.
4. Remove the nut and the solenoid B-terminal electrical connection.
5. Remove the nut and the starter battery ground cable from the stud.
6. Remove the 2 bolts, the stud bolt and the starter motor.

INSTALLATION

1. Position the starter and install the 2 bolts and the stud bolt in 3 stages.
   - Stage 1: Install the 2 starter bolts and the stud bolt finger tight.
   - Stage 2: Tighten the upper bolt to 25 Nm (18 lb-ft).
   - Stage 3: Tighten the lower bolt and stud bolt to 25 Nm (18 lb-ft).
2. Position the starter battery ground cable onto the stud and install the nut.
   - Tighten to 25 Nm (18 lb-ft).
3. Connect the solenoid B-terminal electrical connection and install the nut.
   - Tighten to 12 Nm (9 lb-ft).
4. Connect the solenoid S-terminal electrical connection and install the nut and the starter terminal cover.
   - Tighten to 6 Nm (53 lb-in).
5. Connect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
